WELCOME NOTES

Dear Friends and Colleagues,

On behalf of the ten leading economic universities in Vietnam: *Academy of Finance (AOF), University of Economics - The University of Danang (DUE), National Economics University (NEU), Thuongmai University (TMU), Banking Academy of Vietnam (BAV), University of Economics & Business – Vietnam National University (VNU-UEB), Foreign Trade University (FTU), Hue College of Economics – Hue University (HCE), University of Economics Ho Chi Minh City (UEH), and University of Economics and Law Ho Chi Minh City (UEL)*, we are delighted to extend our warmest greetings to all participants, students, and researchers attending this prestigious event. It is with immense pleasure that we come together to explore, discuss, and enrich our understanding of the dynamic fields of economics and business.

The International Conference for Young Researchers in Economics and Business 2023 (SR-ICYREB2023) is organized by the ten leading economic universities in Vietnam, and with the participation of students from these universities with the goal to create and develop an academic exchange environment with new ideas and research outcomes of students from economic and business universities. It also promotes experience exchange and enhances local and international coordination between students in scientific research to adapt to the new context.

The next few days are packed with engaging sessions, keynote speeches from renowned experts (Minh Tuan Bui - Tax Partner, Deloitte Vietnam and Aaron Saw, Head of Corporate Reporting Insights, ACCA), interactive workshops, and opportunities to connect with fellow enthusiasts. We encourage you to actively participate, share your thoughts, challenge assumptions, and contribute to the collective growth of knowledge in these vital disciplines.

We extend our heartfelt gratitude to all the organizers, sponsors, and speakers who have dedicated their time and efforts to this conference. Your contributions are invaluable to the success of this event.

Let's embark on this intellectual journey with open minds, ready to absorb new ideas and forge lasting connections. May this conference be a catalyst for inspiration, innovation, and collaboration that resonates far beyond its closing remarks.

Once again, a warm welcome to the International Conference for Young Researchers in Economics and Business 2023 (SR-ICYREB2023).

Best regards,

On behalf of the Organizing Committee

Assoc. Prof. Dr. Co Trong Nguyen

People's teacher, President

Academy of Finance

**ASSOCIATE PROFESSOR NGUYEN TRONG CO
PEOPLE’S TEACHER, PRESIDENT OF THE ACADEMY OF FINANCE**

Assoc. Prof. Nguyen Trong Co is the President of the Academy of Finance. He has been working for the Academy of Finance since he was young and held different positions such as lecturer, Head of Financial Analysis Department, Deputy Head of Human Resources Department, and Vice President before being nominated the President of Academy of Finance in 2014.

He is the Editor of the Journal of Finance and Accounting Research and serves the Scientific Board of Finance Research Sector as Vice President and a member of *Scientific Board of Banking Research Sector*.

He was also nominated as honour member of FCPA Australia.

Assoc. Prof. Nguyen Trong Co is the author/coauthor of more than 21 valuable text books and supplementary materials such as “Financial Analysis”, Finance Publishing House, 2017, “Auditing management and usage of mineral resources for sustainable development in Viet Nam”, Finance Publishing House, 2016 and etc.

He has researched actively with more than 20 research projects spread on different fields: corporate finance and public finance, and technological markets. In the Academy of Finance, he has published more than 70 articles in both local and international journals.

KEYNOTE SPEAKERS:

Keynote 1:

Minh Tuan Bui - Tax Partner, Deloitte Vietnam

Keynote topic: “BEPS 2.0 – Global Minimum Tax (Pillar 2) and Investment Attraction in Vietnam”

Minh is Deloitte Private Leader with nearly 20 years of professional experience serving in tax and business advisory services. He holds Tax & Legal Leader position of Deloitte South East Asia in Industrial Products & Construction sector. In Vietnam, he is Leader of Korean Service Group, Tax Leader of Deloitte Private market segment; Global Investment and Innovation Incentives (GI3) Lead Partner. Minh brings a wealth of accumulated knowledge and expertise in various areas of global taxation and in Vietnam to provide his clients with prominence in strategic tax advisory, particularly in strategic tax advice to Vietnamese and international corporations operating in Vietnam; tax due diligence; corporate tax system health check; and tax controversy. With broad experience, Minh has a proven track record of successfully helping corporate clients access the financial reporting of complex tax positions as well as assisting them in negotiating with all levels of tax, customs authorities to obtain currency and certainty.

Minh has contributed significantly to the development of Vietnamese taxation system through his public speeches, quality articles, and interviews, and providing comments on draft tax laws and regulations.

Minh has been recognized as Vietnam’s Tax Controversy Leader by the International Tax Review for four consecutive years (2016-2019).

Keynote 2:

Arron Saw, Head of Corporate Reporting Insights

Keynote topic: “Reporting of R&D: Disclosure without recognitions?”

Aaron drives corporate reporting-related research activities and policies within the Policy and Insights team at ACCA to deliver high quality, professional and innovative inputs on key issues in the global corporate reporting agenda. Aaron believes in sharing knowledge widely. He focuses on making practical and relevant propositions to professional accountants and their organisations on improving the quality of financial and sustainability reporting.

His areas of interest include financial and sustainability reporting, business resilience, digital technology, and improving audit quality. He has designed the framework for a community that supports the professional development of SMPs – the SMP100.

Prior to this role, Aaron was the head of policy and technical for ACCA Maritime Southeast Asia (comprising Malaysia, Brunei, Indonesia, and the Philippines). He also had a decade of experience in a Big Four accounting firm in Malaysia where he was involved in providing audit and assurance services to multinationals and small and medium-sized enterprises operating in a wide range of industries, as well as technical consultancy, developing training programmes and conducting trainings.

Aaron has a Bachelor of Commerce (Honours) Accounting. He is a fellow of ACCA and a member of the Malaysian Institute of Accountants.

MEMBERS OF COMMITTEES OF THE INTERNATIONAL CONFERENCE FOR YOUNG RESEARCHERS IN ECONOMICS AND BUSINESS 2023 (SR-ICYREB 2023)

STUDENT RESEARCH - INTERNATIONAL CONFERENCE FOR YOUNG RESEARCHERS IN ECONOMIC AND BUSINESS 2023 (SR-ICYREB2023)

The Fourth Industrial Revolution (Industry 4.0) is the era of everything being connected to the Internet, marked by disruptive technologies in digitalization, virtual reality, artificial intelligence, and more. As soon as this revolution formed, it had a significant impact on the social lives of humans, gradually permeating every corner of existence. It replaces all manual labor in factories, workshops, and production lines. Any repetitive tasks, no matter how skilled, can be replaced by machines. Therefore, a high-quality workforce is an essential factor for the development of a nation, enabling the exploitation of other resources, leveraging strengths, and enhancing competitiveness in the global market.

At the same time, the Industry 4.0 demands that universities transition from traditional teaching and scientific research models to enterprise-oriented university models to fulfill three main tasks: education, scientific research, and community service. Vietnam is immersing into the regional and global economies as well as the trend of globalization, Vietnamese students and economic students in particular, are facing competitive pressures in both domestic and international labor markets.

Currently, the revised Higher Education Law provides an important legal basis to promote the implementation of autonomous universities, efficient utilization of resources, improvement of higher education quality, ensuring international integration, and better meeting the demand for human resources training in the socialist market-oriented economy and contributing to the socio-economic development of the country.

Hence, in order to reach beyond the boundaries of a nation or region and find one's place, Vietnamese students need to become global citizens, capable of meeting all recruitment needs and adapting to life and work anywhere in the world. Scientific research plays a role in equipping students with knowledge, skills, and scientific methods for learning and research. Engaging in scientific research helps students accumulate experience in report writing, information collection, and other skills needed to meet social demands.

Within the framework of the comprehensive cooperation agreement among universities in the economics and business sector, the Academy of Finance has collaborated with various universities including the University of Economics - The University of Da Nang, University of Economics Ho Chi Minh City, University of Economics and Law Ho Chi Minh City, Thuongmai University, Banking Academy of Vietnam, National Economics University, Hue College of Economics – Hue University, University of Economics - Vietnam National University Hanoi, and Foreign Trade University to jointly organize the international conference “Student Research International Conference for Young Researchers in Economics and Business (SR-ICYREB2023)”. The goal of the SR-ICYREB2023 is to establish and develop an environment for academic exchange, new ideas, and scientific research results of students from various universities in the economics and business. Sharing experiences and enhancing collaboration in management and scientific research activities among students are intended to promote the scientific research endeavors of students from these universities in the new context.

The articles and presentations at the SR-ICYREB2023 hold value not only from a theoretical perspective but also from a practical standpoint. In this conference, the Organizing Committee received more than 300 submissions from student authors and selected 235 papers for publication in the proceedings. The content of these published articles focuses on key issues such as economics, finance, accounting, business administration, socio-economic development, etc... he conference will serve as a platform for students from various economic and business universities to exchange ideas, provide academic opinions, share research experiences, analyze current situations, forecast contemporary issues, and discuss opportunities and challenges for the upcoming phase of socio-economic development.

THE IMPACT OF CORPORATE SOCIAL RESPONSIBILITY (CSR) ON EMPLOYEE ENGAGEMENT AND EMPLOYEE CUSTOMER ORIENTATION WITHIN SMALL AND MEDIUM-SIZED ENTERPRISES (SMES) IN VIETNAM

Author: Vu Ngoc Minh Thu¹, Le Cong Thao Linh², Duong Cong Doan², Phan Ha Tram Anh²

Mentor: Tran Thi Bich Nhung²

ABSTRACT: This paper seeks to investigate the influence of CSR on employee engagement and their customer orientation, with a focus on sustainable development in Vietnamese SMEs. We use a combination of qualitative and quantitative research to develop CSR models and measurements. With a model size of 200 respondents, the results show that: CSR has a direct positive effect on both employee engagement and their customer orientation; on both of which ethical responsibility has the greatest influence. Contrary to previous studies, the research does not find a visible impact of philanthropic responsibility on employee engagement in SMEs in Vietnam. The results are thus discussed and thereby leading to a number of practical implications for Vietnamese SMEs.

Key words: CSR; SMEs; employee engagement; customer orientation; Vietnam; sustainable.

1. INTRODUCTION

In the past few decades, CSR initiatives have received cumulative attention from businesses around the world (Kolk et al., 2015). However, CSR studies have mainly focused on developed countries, while expectations about the social responsibility of business organizations in developing countries such as Vietnam may differ due to the influence of culture and national ethics (Visser, 2008). Therefore, a scholarly imperative lies in the expansion of research endeavors to investigate the matter of CSR within the intricate tapestry of Vietnam, in order to develop a comprehensive understanding of its interplay with the local business landscape.

Under the increasing pressure of human demand, businesses are required to address sustainability issues. Sustainability encapsulates a shift in societal values and goals, advocating for a holistic approach that addresses the challenges posed by resource depletion, environmental degradation, social inequality, and economic instability. It becomes imperative to undertake a comprehensive reassessment of CSR concepts and models, aiming to foster and enhance sustainability endeavors encompassing economic, social, and environmental dimensions (Hoque et al., 2018). In Vietnam, CSR research has been relatively well developed, however, there are still limitations in linking CSR with sustainable development objectives of the business.

Employee engagement is an important concept in organizational management. However, to date, few empirical studies have been conducted to investigate the impact of CSR on employees and their work attitudes (Ali et al., 2010; Aguilera et al., 2007). Since employee is generally accepted to be the most important stakeholder of any corporations (Saks, 2006), is necessary to focus on researching more practical issues about the attitudes and behaviors of employees in business settings. In addition, Saks (2006) and Robinson et al. (2004) argue that current studies on employee engagement in academia are not sufficient. The scarcity of scholars investigating the relationship between CSR and employee engagement in developing countries like Vietnam necessitates a call for further studies to explore these dynamics.

¹ Foreign Trade University, Email: vungocminhthu235@gmail.com

² Foreign Trade University.

Customer orientation also plays a crucial role in fostering a strong bond between employees and customers within the framework of customer-employee identification. Customer-focused behaviors lead to the long-term development of the relationship between organizations and customers, yielding mutual benefits for both parties (Dunlap et al., 1988; Saxe & Weitz, 1982). Numerous global studies have indeed examined the positive association between CSR and employee customer orientation in business contexts, exemplified by the works of Ana Patrícia (2019) and Choong-Ki Lee (2013). However, in Vietnam, only a few studies have addressed the influence of CSR and employee customer orientation within enterprises, and empirical research on this matter remains limited, underscoring the need to fill this research gap.

Prior research on the impact of social responsibility has predominantly focused on large corporations and international brands. However, the characteristics of SMEs differ from those of large enterprises. For instance, in SMEs, ownership and management rights are typically not separated, allowing owners to make business decisions based on personal preferences (Spence, 1999). Acceptance of CSR within SMEs may depend on the owner's or manager's perspectives and understanding of CSR, warranting further investigation into this matter. Through a comprehensive review of available literature, our research team has observed that CSR research in Vietnam often concentrates on the consumer perspective rather than the employee viewpoint, particularly in relation to SMEs, indicating that this research, which examines CSR from the employee perspective, holds significant value for future literature. Furthermore, no existing studies in Vietnam have truly addressed the relationship between employee engagement and employee customer orientation as distinct dependent variables.

Based on these reasons, our research team has decided to embark on the topic: **'The Impact of Corporate Social Responsibility (CSR) on Employee Engagement and Employee Customer Orientation within Small and Medium-sized Enterprises (SMEs) in Vietnam.'** By revising prominent models and theories based on a combination of intensive literature review and qualitative research, we developed a CSR model gravitating towards sustainability in the context of SMEs in Vietnam to measure the impact of CSR on employee engagement and employee customer orientation.

2. THEORETICAL FRAMEWORK AND HYPOTHESES

2.1. Corporate Social Responsibility

Corporate Social Responsibility (CSR) is a topic that has been studied for decades. All organizations, businesses, and governments perceive social responsibility from their own perspective and context, depending on their characteristics and level of development (Kapferer, 2008). As a result, there is no universally accepted or definitive concept of CSR to date (Skudiene and Auruskeviciene, 2010). This paper does not intend to adopt or defend a singular CSR concept since this is outside the realm of the present scope. However, for the purpose of this paper, the definition of CSR is scrutinized under Elkington's (1997) sustainable approach, which is a management method to balance the interests of business leaders and administrators with internal and external stakeholders, through a comprehensive, appropriate, and complete theory.

2.2. Employee Engagement

To date, a universally accepted and comprehensive definition of employee engagement remains elusive. Nevertheless, there is a growing consensus that distinguishes this concept from other management-related constructs such as employee commitment, organizational citizenship behavior (OCB), or job satisfaction (Solomon Markos, 2010). In 1990, Kahn (1990) introduced the concept of employee engagement, which encompasses the utilization and management of an organization by its members in the context of their job responsibilities. Engaged individuals actively and enthusiastically carry out their roles and tasks. Employee engagement serves as a valuable tool for organizations striving to gain a competitive edge over their counterparts. It recognizes that human resources are an invaluable and unique asset that cannot be replicated

or imitated by competitors. Consequently, effectively managing and fostering employee engagement is crucial. Baumruk (2004) underscored this perspective by highlighting employee engagement as the most potent factor for gauging a company's vitality.

2.3. Employee Customer Orientation

In the realm of marketing management theory and practice, employee customer orientation holds a pivotal position. Previous research has approached the concept of employee customer orientation from two distinct perspectives:

1. *The first perspective focuses on the behavioral orientation of employees (Saxe and Weitz, 1982).*
2. *The second perspective delves into the psychological orientation of employees (Brown et al., 2002).*

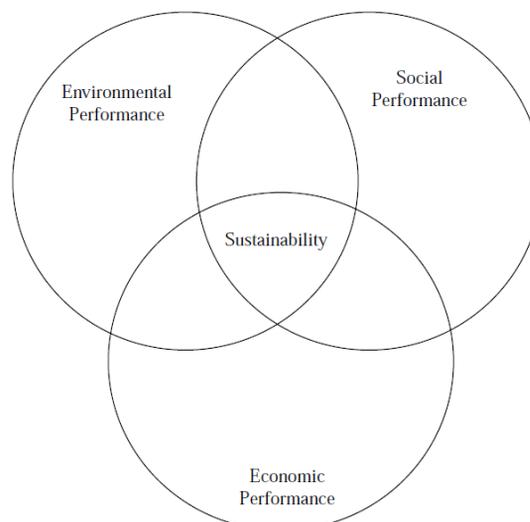

Numerous notable studies have demonstrated that successful organizations exhibit a strong emphasis on employee customer orientation (Deshpandé, Farley, and Webster, 1993; Narver and Slater, 1990). Comprehensive studies such as Narver and Slater (1990) and Brown et al. (2002) highlight the importance of assessing employee customer orientation from the employees' own standpoint, exploring their beliefs, values, and thoughts through specific questions. This research topic also adopts an employee-centric approach in evaluating employee customer orientation. Thereby, we define customer orientation as an employee's inclination or predisposition to fulfill customer requirements within a work environment. Following Brown et. al (2002) theories, we suggest that customer orientation comprises two aspects. The first aspect, known as the needs dimension, reflects employees' beliefs regarding their capacity to meet customer needs, drawing upon Saxe and Weitz's (1982) understanding of customer orientation. The second aspect, referred to as the enjoyment dimension, gauges the extent to which engaging with and assisting customers is inherently pleasurable for an employee.

2.4. Triple Bottom Line Theory and Development Direction

2.4.1. Triple Bottom Line Theory

Most CSR theories recognize that the foundation of this concept is the Triple Bottom Line (TBL) theory, which was introduced in 1987 at the Brundtland Commission (Paulina et al., 2017). This theory was officially named by John Elkington in 1997, focusing on three key points: economic, environmental, and social - the model.

Figure 1: Elkington (1994) Sustainable CSR Model

Economic aspect is considered the key point of a company and the profit figure used in income reports for each share. Uddin et al. (2008) argue that the economic dimension of CSR is closely related to the direct and indirect impacts of business activities on communities, localities, and other stakeholders.

Environmental aspect, TBL emphasizes the company's actions to make the living environment increasingly safe and beautiful. Because businesses are usually the primary cause of environmental damage, the minimum they can do is to minimize or eliminate negative impacts on the environment (Gupta, 2011).

Social aspect, the variables refer to the social aspects of a community or region and may include measurements of education, equity, and access to social resources, health and welfare, quality of life, and social capital. This is extremely important for small and medium-sized enterprises because they often recruit labor from the areas where they operate, so their responsibility is doubled: employees are also the local community.

2.4.2. Development of Triple Bottom Line Theory

After selecting and studying to apply the TBL theory to building a model, the authors proposes: In terms of social aspects, divided into 2 factors including Ethical and Philanthropic.

The TBL method has been subject to several limitations and concerns (Freudenberg and Keating, 1982; Dale et al., 1997). Research indicates that the social aspect of the TBL should not be viewed as a determining factor alone. Reflecting on the definition of the social aspect within the Triple Bottom Line framework, it entails the measurement and evaluation of an organization's impact on society as a whole, encompassing local, national, and global levels (Elkington, 1997). Hence, it becomes essential to enhance a model that facilitates the easy measurement of the social factor, particularly for the targeted SMEs group addressed by the research team. Expanding on his CSR model, Carroll (2008) emphasized that Ethical and Philanthropic are two core responsibilities in this model. The importance of ethical and philanthropic responsibilities has been widely observed. These two responsibilities fully constitute the social aspect in the CSR of an organization (Carroll, 1979, 1999, 2010), so they can be added to the TBL model in terms of social aspect (Jintao Lu et al., 2020). In addition, one of the latest in-depth studies on CSR by Visser (2014) has developed the concept of CSR 2.0, in which he emphasizes that the DNA of CSR includes 4 aspects, of which two new aspects are "good governance" and "social contribution", emphasizing the implementation of ethical and philanthropic responsibilities of businesses.

Hence, in order to address the limitations of the TBL model, this study incorporates the principles presented in the Carroll (2008) and Visser (2014) models, integrating the ethical and philanthropic responsibilities as additional components within the social dimension of the TBL framework.

2.5. Research Hypotheses

2.5.1. CSR and Employee Engagement

In previous studies on employee outcomes, engagement has been considered a higher-level construct, encompassing commitment, job satisfaction, and organizational citizenship behavior (Solomon Markos, 2010). Organizations increasingly promote CSR implementation to respond to competition and pressure from various stakeholders (Chaudhary, 2017). Therefore, this study investigates the impact of CSR on the first dependent variable, employee engagement. Past research demonstrates that the involvement in CSR can build a strong bond between employees and the organization, leading to better employee engagement and firm performance over time. As developed from our literature review, four dimensions of sustainable CSR, supported by Carroll's pyramid, including economic, environmental, ethical and philanthropic responsibilities, can be hypothesized to have a positive effect on employee engagement.

Firstly, with economic responsibilities, there exists a consensus among past researchers that individuals contribute and exchange their attitudes and behaviors with others, with the desire to benefit from what they receive, therefore, when a business supports its employees economically, employees tend to react with gratitude, thereby increasing their level of commitment to the organization (Blau, 1964; David Casey & Sebastian Sieber, 2016). On environmental responsibility, according to the research results of Gill, R. (2015), employees who have faith in environmental responsibility have a higher level of engagement than those who believe that their organization has a negative impact on the ecosystem. Moreover, according to the research results of Ali et al. (2020), ethical responsibility strongly influences employee engagement. Aiming for a culture of corporate integrity, in which ethical behavior becomes everyone's responsibility, helps build a stronger relationship between employees and the company (Mirvis, P., 2012). Lastly, with philanthropic responsibility, workers tend to be proud when they are part of a humane and sharing company, and therefore, employees will want to be attached to the organization in the long run (Tran et al., 2018). Studies by Lee et al. (2009) also come to the same conclusion with low employee turnover in companies that practice good philanthropic responsibility. All dimensions of CSR has been proved to have a direct positive impact on employee engagement, hence the research team proposes these hypotheses:

H1: Economic factors have a positive impact on employee engagement

H2: Environmental factors have a positive impact on employee engagement

H3: Ethical factors have a positive impact on employee engagement

H4: Philanthropic factors have a positive impact on employee engagement

2.5.2. CSR and Employee Customer Orientation

Recent research suggests that CSR studies need to expand beyond the outcome variables mentioned in previous literature to achieve a more comprehensive understanding of the impact of CSR awareness on business outcomes (Aguilera et al., 2007). Based on the theoretical foundation and to suggest directions for future research on customer-oriented outcomes while ensuring a detailed analysis of the impact of CSR from the employee perspective, this study focuses on investigating the second dependent variable, employee customer orientation. According to Binghu et al. (2020), empirical results indicate that employees' perception of both internal and external CSR not only directly influences employees' customer orientation but also indirectly affects their customer orientation through job engagement.

The impact of all four dimensions of CSR in our model on employee customer orientation has been analyzed in past research. According to the research results of Mahmood, S. and Khan, Z. (2023) and Wood (2010), good implementation of the economic aspect in CSR positively affects employee perception and practice of customer orientation. The research results of Lars Isaksson and Timothy Kiessling (2016) also proves a close relationship between a company's environmental responsibility and employee customer orientation, indicating that with widespread environmental responsibility practices and communication, employees' customer-oriented mindset will also spread within the organization, driven by pride and motivation to better serve their customers. According to the research results of Binghu et al. (2020), a company with ethical values has a strong influence on the customer orientation of their employees as this makes employees feel that their actions are meaningful and have a positive impact on customers. According to Kiessling et al. (2016), the philanthropic aspect of CSR is a prerequisite and has a positive impact on employee customer orientation. Therefore, these hypotheses are proposed:

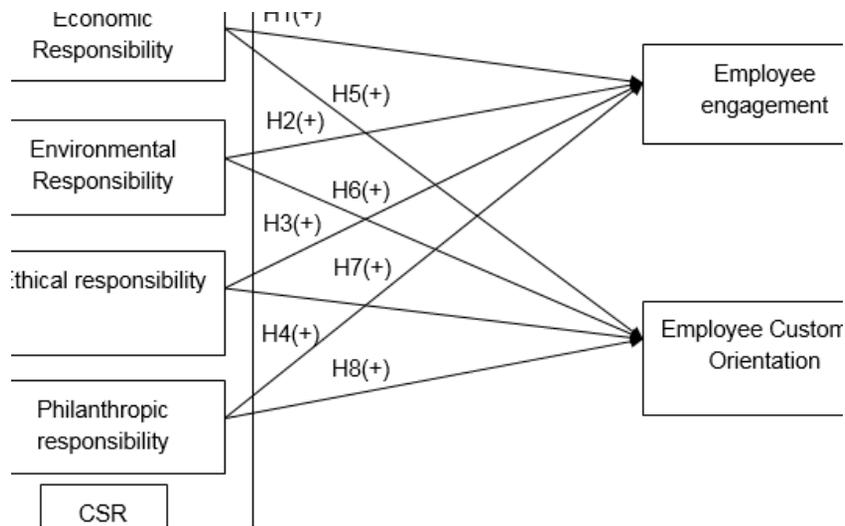

H5: Economic factors have a positive impact on employee customer orientation

H6: Environmental factors have a positive impact on employee customer orientation

H7: Ethical factors have a positive impact on employee customer orientation

H8: Philanthropic factors have a positive impact on employee customer orientation

Figure 2: Complete Research Model and Hypotheses

3. RESEARCH METHODOLOGY

Recognizing that the practice of CSR may vary from country to country due to the influence of social context, the authors realize that it is necessary to adjust the measurement tools from previous studies to fit the context, regulations, and operating environment of businesses in Vietnam. Therefore, the topic uses a mixed research method.

3.1. Qualitative research

To fit with SMEs in Vietnam, the author conducted a qualitative study by group discussion with 6 participants who are employees, both male and female, aged 25-52, working at two companies that the group considers to perform CSR well and convenient for surveying, which are Thoi Thanh Binh Co., Ltd. and Minh Minh Fashion Co., Ltd. The discussions were conducted from February 2023 to March 2023 to create conditions for all participants to arrange their work and have time for exchanging ideas.

3.2. Scale design

The scales are inherited from the scales of Uddin et al. (2008); Fadun et al. (2014); Solomon Markos (2010) and Brown et al. (2002), through group discussion with adjustments to fit.

Table 1: Scale development

No.	Factor	Observed variable	Code	Reference
1	Economic responsibility (KT)	The company uses profits appropriately to increase social welfare (the multiplier effect)	KT1	Uddin et al. (2008), developed from Triple Bottom Line.
2		The company fulfills tax responsibilities well	KT2	
3		The company conducts business activities reliably and fairly	KT3	
4	Environmental responsibility (MT)	The company ensures that production and business activities do not harm the environment	MT1	Uddin et al. (2008), developed from Triple Bottom Line.
5		The company ensures that production and business activities do not harm the environment	MT2	
6		The company encourages employees to perform sustainable environmental responsibilities	MT3	

7		The company performs appropriately to social expectations and ethical standards	DD1	
8	Ethical responsibility (DD)	The company acknowledges and respects accepted ethical standards/developing ethical standards	DD2	Fadun et al. (2014), developed from the CSR model of Caroll.
9		The company prevents ethical standards from being violated to achieve the company's goals	DD3	
10	Philanthropic responsibility (TN)	The company contributes resources to community development	TN1	Fadun et al. (2014), developed from the CSR model of Caroll.
11		The company performs philanthropic activities appropriately and according to social expectations	TN2	
12		The company voluntarily supports projects to improve the value and quality of community life	TN3	
13	Employee engagement (GK)	Employees support the organization for colleagues and introduce the organization to potential employees and customers	GK1	Solomon Markos (2010)
14		Employees have a strong desire to become members of the organization despite opportunities to work elsewhere	GK2	
15		Employees spend extra time, effort, and innovation to contribute to the company's success	GK3	
16		Employees feel that they are an important part of the company	GK4	Added through group discussion
17		Employees feel that their work is meaningful and purposeful	GK5	
18	Customer orientation (DHHK)	Employees want to maximize customer needs	DHHK1	Brown et al. (2002)
19		Employees want to build long-term relationships with customers	DHHK2	
20		Employees feel more motivated to work when customer needs are met	DHHK3	Added through group discussion

3.3. Quantitative research

3.3.1. Sampling method

Due to the large number of businesses and the limited time for conducting the research, the research team discussed and chose the non-probability sampling method as the most suitable method for the study.

3.3.2. Data collection method

To address the research questions, the study collected data from primary sources - through social and demographic surveys conducted via questionnaires. The authors designed a questionnaire to collect primary data related to CSR from individuals who are currently or previously employed. All observed variables used a 5-point Likert scale. The number 1 indicates “strongly disagree” and the number 5 indicates “strongly agree”.

The survey process involved a pilot survey and the main survey. The authors conducted a preliminary quantitative study with a sample size of $n = 100$ by conducting surveys on paper and sending online questionnaires to the research subjects. The convenience and non-probability sampling method were used to collect the samples. The collected data were then processed using SPSS software to evaluate the Cronbach's alpha coefficient. After evaluating the Cronbach's alpha coefficient, all the Cronbach's alpha coefficients for each observed variable were greater than 0.6, and no observed variable had a correlation coefficient smaller than 0.3. Therefore, the authors retained these observed variables.

For the official study, the team collected data by surveying employees from 45 small and medium-sized businesses in Vietnam and employees who have worked for companies that the authors identified based on their scale. The survey period started from March 06, 2023 to March 30, 2023. The questionnaire was sent to the businesses identified within the scope by the authors.

4. RESULTS AND DISCUSSION

4.1. Results

4.1.1. Statistical Analysis

Descriptive Statistical Analysis

Table 2: Descriptive Statistical Analysis

		Frequency	Percent
Gender	Male	78	39.0
	Female	122	61.0
Living area	Ho Chi Minh City	152	76.0
	Hanoi	24	12.0
	Other	24	12.0
Number of employees (people)	Under 10	5	11.0
	From 10 to 50	21	47.0
	From 50 to 100	5	11.0
	Over 100	14	31.0
Annual turnover (VND)	Under 1 billion	11	25.0
	From 1 to 3 billion	9	20.0
	From 3 to 10 billion	17	38.0
	From 10 to 50 billion	4	9.0
	From 50 to 100 billion	2	4.0
	Over 100 billion	2	4.0

Among a total of 200 survey responses, 39% were male and 61% were female. The majority of respondents resided in Ho Chi Minh city, accounting for 76% of the survey participants. Hanoi and other provinces accounted for 12% of the survey population. Among the 45 surveyed SMEs, the majority operated in the 10-50 employee segment (47%). In terms of revenue, the largest proportion (38%) came from businesses with revenues ranging from 3 to 10 billion.

4.1.2. Assessment of Measurement Models

Table 3: Evaluation of the Outer Measurement Model

Latent Variables	Indicators	Factor loadings	Cronbach's alpha	Composite reliability	Average variance extracted (AVE)
Ethical responsibility (DD)	DD1	0.864	0.768	0.866	0.684
	DD2	0.803			
	DD3	0.813			
Employee Engagement (GK)	GK1	0.823	0.856	0.897	0.635
	GK2	0.733			
	GK3	0.797			
	GK4	0.83			
	GK5	0.797			
Economic responsibility (KT)	KT1	0.84	0.734	0.849	0.652
	KT2	0.75			
	KT3	0.83			

Latent Variables	Indicators	Factor loadings	Cronbach's alpha	Composite reliability	Average variance extracted (AVE)
Environmental responsibility (MT)	MT1	0.868	0.738	0.85	0.654
	MT2	0.81			
	MT3	0.744			
Philanthropic responsibility (TN)	TN1	0.855	0.804	0.884	0.717
	TN2	0.862			
	TN3	0.823			
Employee Customer Orientation (DHKH)	DHKh1	0.82	0.754	0.858	0.669
	DHKh2	0.851			
	DHKh3	0.782			

Factor Loadings

The authors utilized the Outer Loading coefficient in SmartPLS4 to assess the quality of observed variables. According to Hair et al. (2019), an outer loading coefficient > 0.7 indicates a strong connection between observed variables and the latent construct. After assessing the measurement quality using the outer loading coefficient, none of the observed variables were excluded based on cross-loading. All 20 observed variables were accepted, and they will be analyzed in the subsequent steps alongside the 6 latent factors.

Cronbach's Alpha and Composite Reliability

After examining the loading coefficients, the authors assessed the reliability of the measurement using two indices: Cronbach's Alpha and Composite Reliability (CR). Cronbach's Alpha should be > 0.7, and the total variance extracted should be > 0.3. CR values ranging from 0.7 to 0.9 meet the required criteria (Hair et al., 2019). The test results indicate that all latent variables have Cronbach's Alpha coefficients greater than 0.7, demonstrating the reliability of the measurement scale. Additionally, all latent variables exhibit good internal consistency reliability (0.7 < Alpha < 0.9). The CR values for all measurement scales range from 0.7 to 0.9, indicating that the measurement scale meets the reliability requirement.

Average Variance Extracted

To assess the convergent validity of the measurement scale, the authors relied on the Average Variance Extracted (AVE) index. Hock and Ringle (2010) suggest that a measurement scale achieves convergence if the AVE value is equal to or greater than 0.5. The test results reveal that the AVE values of the research measurement scales all exceed 0.6, indicating that the measurement scale achieves convergence.

4.1.3. Assessment of Structural Model

Multicollinearity analysis

Table 4: Multicollinearity analysis

	DD	GK	KT	MT	TN	DHKh
DD		2.094				2.094
GK						
KT		2.069				2.069
MT		1.507				1.507
TN		1.582				1.582
DHKh						

According to Hair et al. (2019), the VIF evaluation thresholds are proposed as follows: $VIF \geq 5$: There is a high likelihood of multicollinearity; $3 \leq VIF \leq 5$: Multicollinearity may be present; $VIF < 3$: Multicollinearity is unlikely. The results show that the VIF coefficients in the research model, as shown in Table 3, are all less than 3. Therefore, multicollinearity does not occur in the model.

Correlation Matrix and Discriminant Validity

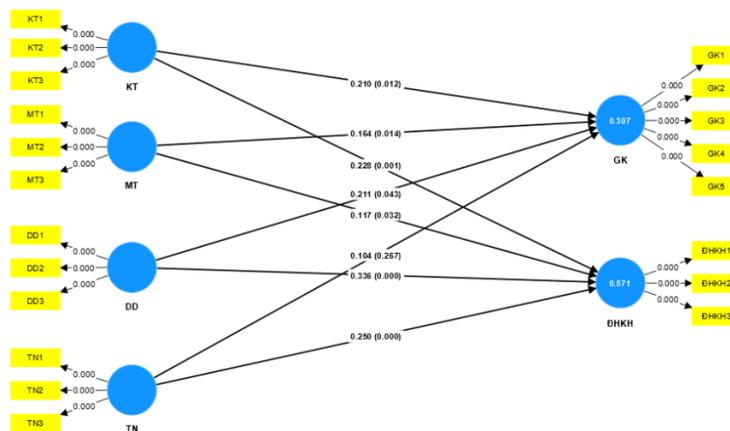

Table 5: Correlation Matrix and Discriminant Validity

	DD	GK	KT	MT	TN	ĐHKH
DD						
GK	0.58					
KT	0.836	0.607				
MT	0.595	0.49	0.763			
TN	0.739	0.436	0.611	0.288		
ĐHKH	0.888	0.657	0.826	0.595	0.736	

The discriminant validity indicates the differentiation of one construct from other constructs within the model. Henseler et al. (2015) demonstrated that the Heterotrait-Monotrait (HTMT) ratio they proposed is an optimal method for assessing discriminant validity. Regarding the HTMT ratio, an HTMT ratio below 0.9 indicates discriminant validity of the measurement scale (Henseler et al., 2014). Table 5 displays the coefficients in the model testing, all of which are below 0.9, thus confirming that the measurement scale satisfies the condition of discriminant validity.

PLS Algorithm and Bootstrapping

Figure 3: PLS Algorithm and Bootstrapping

Hair et al. (2017) proposed that an acceptable range for R² values is 20%, with R² values of 25%, 50%, and 75% indicating weak, moderate, and strong predictive ability of the independent variable on the dependent variable, respectively. According to the analysis results, the adjusted R² value for Variable GK (0.571) can be considered moderate, while the R² value for Variable B (0.307) is relatively weak.

Research Hypotheses Testing

Table 6: Research Hypotheses Testing

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (O/STDEV)	P values	Support
DD→GK	0.211	0.216	0.104	2.022	0.043	Yes
DD→ĐHKH	0.336	0.34	0.075	4.461	0	Yes
KT→GK	0.21	0.215	0.084	2.499	0.012	Yes
KT→ĐHKH	0.228	0.228	0.069	3.308	0.001	Yes
MT→GK	0.164	0.169	0.067	2.462	0.014	Yes
MT→ĐHKH	0.117	0.121	0.055	2.149	0.032	Yes
TN→GK	0.104	0.96	0.093	1.111	0.267	No
TN→ĐHKH	0.25	0.247	0.07	3.551	0	Yes

A bootstrapping method was conducted in SmartPLS4 to determine the path coefficient and its

associated p-value for the model. The research paper suggested eight hypotheses, all of which are direct relationships. The SmartPLS results indicated that all the direct impacts of the four dimensions of CSR are positive and significant on employee customer orientation: economic ($\beta = 0.228$, $p < 0.001$); environmental ($\beta = 0.164$, $p = 0.014$); ethical ($\beta = 0.336$, $p < 0.001$); and philanthropic ($\beta = 0.25$, $p < 0.001$), consequently, hypotheses H5, H6, H7, H8 were supported. Meanwhile, the results revealed that all the direct impacts of CSR on employee engagement (except philanthropic) are positive and significant: economic ($\beta = 0.21$, $p = 0.012$); environment ($\beta = 0.164$, $p = 0.014$); ethical ($\beta = 0.211$, $p = 0.043$), hence hypotheses H1, H2, H3, were supported. One exception is the impact of philanthropic CSR on employee engagement which was found to be positive but insignificant ($\beta = 0.104$, $p < 0.257$) hence hypothesis H4 was not supported.

4.2. Discussion and Implications:

4.2.1. Discussion

In both relationships with employee engagement and customer orientation, ethical responsibility is the factor with the highest influence ($\beta = 0.211$ and $\beta = 0.336$). The research findings align with previous studies, showing that ethical responsibility has the strongest impact on employee motivation and commitment in businesses. One of the reasons for this strong relationship is that ethical responsibility, although voluntary, plays a central role in CSR models, influencing the decisions of individuals and organizations, particularly in issues with a high level of voluntarism like CSR (Hoa, T., and Minh, C. N., 2013). While ethical issues and ethical responsibility are considered a separate aspect of CSR, it is important to emphasize that ethical responsibility exists within all other responsibilities (Carroll, A.B., 2010). Another possible reason stems from the aspect of tradition and culture. Scholars have highlighted the importance of considering long-standing ethical traditions before applying CSR in the context of developing countries (Visser et al., 2008). In Vietnam, tradition is seen as the soul of the nation and has a certain influence on how individuals think and behave in society. Based on the analysis by Nguyen et al. (2018), traditional factors such as Confucian values, religious beliefs, and others strongly address the ethical aspect in all aspects of life.

The results show that the environmental factor has very little impact on both employee engagement and customer orientation within SMEs in Vietnam ($\beta = 0.164$; $\beta = 0.117$). This can also be explained by the fact that employees may not directly see the connection between the company's environmental protection activities and their own work, especially when their job is not directly related to the environment. In the context of this study, out of the 200 samples collected from 45 SMEs, hardly any businesses were engaged in environmental activities. It should be noted that the research focused on SMEs, a segment often described as "difficult to access" and slow in adopting "green business" practices due to management and resource constraints inherent in SMEs (Sue Cassells, Kate Lewis, 2011).

The results revealed that philanthropic CSR had no significant impact on employee engagement. This is a rather new finding as it contradicts many previous foundational studies that found a positive impact of philanthropic responsibility on employee engagement. This may be due to the fact that CSR is influenced by the context in which it is applied (Ortenblad, 2016). SMEs in Vietnam only engage in corporate social responsibility (CSR) if they have sufficient financial and human resources. While other three responsibilities are the most fundamental obligations of a business, philanthropic responsibility is somewhat secondary. In his model, Carroll placed philanthropic responsibility at the highest level while emphasizing that to achieve philanthropic responsibility, businesses need to first fulfill their economic, legal, and ethical responsibilities. Philanthropic responsibility is the least important responsibility in the model (Carroll, 1991). Regarding the employee aspect, Maslow's hierarchy of needs theory can be applied to explain why this relationship

is not accepted. In many previous studies, philanthropic responsibility has been strongly linked to the need for self-actualization, the highest level in Maslow's hierarchy of needs (Meyers, R., and Weaver, L., 2018). In the current era, especially in developing countries and post-Covid-19, many employees may not focus on this need because they need to prioritize stability in their work and safety in both their professional and personal lives (Ertel S., 2020). This can explain why philanthropic responsibility does not have a significant impact on employee commitment in small and medium-sized enterprises in Vietnam.

4.2.2. Implications

The results emphasize the prioritization of ethical responsibilities within a business to achieve positive employee outcomes. The research team supports the view that merely implementing ethical rules or providing ethics training is insufficient. Instead, managers should strive to foster an atmosphere of ethical respect within the organization, including role models who actively demonstrate the company's ethical values.

Economic responsibility strongly influences both aspects of employee outcomes within the organization. Economic responsibility is considered the focal point of CSR debates, particularly regarding the shift from harm reduction to value creation (Luetkenhorst, 2004). This suggests that business managers should not only focus on company profits but also create value for society at large.

In terms of the environment, based on theoretical foundations, it can be inferred that the environmental responsibility is not emphasized in previous studies conducted globally. However, the research team has found that environmental responsibility does impact employee outcomes in Vietnamese SMEs, albeit to a small extent. Therefore, the research findings encourage businesses to reconsider their programs aimed at raising environmental awareness among their employees. In addition to developing educational and training programs on environmental responsibility, businesses can also signal to their employees that they care about certain social and environmental issues through the development of products and services that reflect this concern.

Philanthropic responsibility is difficult to measure and implement, and it can only be fully realized when other responsibilities are effectively fulfilled (Carroll, 1979, 1991). Given the limited capital and human resources of SMEs in Vietnam, the study suggests that philanthropic responsibility should be considered last after other responsibilities have been effectively addressed.

CONCLUSION

This study aims to demonstrate the relationship between corporate social responsibility (CSR) of small and medium-sized enterprises (SMEs) in Vietnam and the level of employee engagement and customer orientation. Regarding the research findings, most of the results are consistent with previous studies, indicating that economic responsibility, environmental responsibility, ethical responsibility, and philanthropic responsibility of the business all have a positive impact on employee engagement and customer orientation within the company to varying degrees. A new finding in the formal quantitative research process is that philanthropic responsibility does not significantly influence employee engagement but has a rather strong impact on employee customer orientation. From a theoretical perspective, the study provides additional foundational theories for researching CSR in Vietnam. Consequently, the study demonstrates the need for a more formal and appropriate measurement scale for CSR in the context of SMEs in Vietnam. The scale used can contribute to the development of more comprehensive and suitable measurement scales for future research. On a practical level, SMEs in Vietnam can recognize the importance of CSR to their business outcomes and understand the prioritization of various component responsibilities for resource allocation. Additionally, the research can help establish evaluation standards for businesses and societal expectations of accepted corporate behavior.

Although this study has achieved certain results and identified new variables, it cannot avoid certain limitations that need to be supplemented and adjusted by future research: There is a lack of foundational theories on the sustainable CSR model when combining this model with other fundamental theories such as those of Carroll (1991) and Visser (2014). Although this model is new and has appropriate characteristics for research, overcoming the limitations of previous models, the sustainable CSR model and the separation of social aspects into ethical and philanthropic dimensions will affect the evaluation of outcomes and managerial implications without any research testing the reliability of this model. Future studies should further explore related theories, examine the reliability of this model through expert interviews, and employ various research methods such as analysis and extraction.

THE EFFECT OF SOCIAL CAPITAL AND TEAM EFFICACY ON INNOVATIVE TEAM PERFORMANCE: THE MODERATED MEDIATION OF SHARED LEADERSHIP

Author: Luu Khanh Linh¹, Pham Mai Linh², Le Thi Ngoc Khanh², Do Duy Tien²

Mentor: Nguyen Thi Hanh²

ABSTRACT: *The present research paper explores the correlation among social capital resources, team efficacy, and innovative team performance. The present study employs Partial Least Squares Structural Equation Modelling (PLS-SEM) to analyse the data gathered from a sample of 200 innovative teams. The findings reveal that team mentors positively affect team performance while team efficacy mediates the relationship between members and leaders as well as in communities to achieve better team performance; finally suggest that shared leadership moderates the relationship between social capital and team performance. This paper is the first study that examines shared leadership as a moderated mediator variable underlying the relationship between social capital, team efficacy, and innovative team performance. The results demonstrate a significant positive influence of social capital and team efficacy on innovative team performance through shared leadership.*

Keywords: *social capital, internal social capital, external social capital, team efficacy, shared leadership, innovative team performance, moderated mediation.*

1. INTRODUCTION

In today's rapidly changing global environment, innovation has become crucial for organizations to gain competitive advantages. Innovative teams play a critical role in developing and improving traditional procedures. However, connecting team members and their ideas to maximize team performance presents unique challenges. Social capital, defined as an individual's ability to gain advantages through their social networks, has been found to positively affect innovative team performance. Nonetheless, the concept of social capital and its influence on innovative team performance is not yet fully understood. Traditional leadership has limitations in promoting social capital within teams, particularly in innovative work, and shared leadership may be more suitable for enhancing collaboration, individual satisfaction, and moderating the relationship between social capital and innovative team performance. However, research on the role of shared leadership in enhancing innovative team performance is limited. The study investigates the mediating role of shared leadership in the relationship between social capital and innovative team performance and provides evidence of how shared leadership leverages innovative team performance in student startups.

In this study, we analyze the effects of social capital on innovative team performance. First, this study tries to systemize the literature on the related matters and our empirical results may provide important evidence so that innovative student startups can adjust their teamwork performance to generate more innovation and achieve remarkable achievement through utilizing social capital and implementing the role of shared leadership in daily operation.

In particular, our analysis is centered on four key questions as follows:

1. What are the definition and theoretical underpinnings of social capital? How does social capital affect innovative student startups?
2. What is shared leadership? How does social capital affect innovative team performance in student startups?

¹ Foreign Trade University, Email: linhk02.ftu@gmail.com

² Foreign Trade University.

3. Do Team efficacy and Shared leadership moderate or mediate the relationship between social capital and innovative team performance?

4. How does shared leadership leverage innovative team performance in student startups?

2. THEORY BACKGROUND AND HYPOTHESIS DEVELOPMENT

2.1. Social capital

2.1.1. Literature review of Social capital

The concept of social capital was first introduced as a contextual complement to human capital by sociologists. During its early development, social capital was viewed as a fundamental resource for individuals and communities, as it has the potential to provide access to valuable resources such as information, social support, and political power (Portes, 1998).

In contemporary times, social capital has become a vital resource for firms, as it enables access to information, resources, and opportunities via the establishment of networks and the development of relationships based on trust and shared norms (Adler and Kwon, 2002). According to Wang et al (2020), the quality of social networks was quantified as the level of integration, coordination, connection, and cohesiveness, and was found to enhance team collaboration and knowledge sharing, leading to a significant increase in overall team performance.

2.1.2. Literature review of Team performance

Zaccaro et al (2009) argued that most previous studies on entrepreneurial teams have predominantly defined team performance as the extent to which teams accomplish their desired strategic visions and valued objectives. The focus of these studies has primarily been on productivity as a fundamental measure of team performance. However, as early as the 90s, there has been a growing interest in incorporating team effectiveness and team efficiency as additional criteria for evaluating team performance (Hackman, 1987).

In a broader sense, team performance is conceptualized as an emergent phenomenon that arises from the goal-oriented process in which teams and their members utilize their individual and shared resources to meet expected or unexpected demands in taskwork and core processes (Burke et al., 2006). This approach serves as the foundation for our study, which investigates various dimensions of team performance within the context of entrepreneurial teams.

2.1.3. Literature review about social capital and team performance

The concept of social capital is well-supported by empirical evidence, indicating its substantial influence on team performance. For instance, Tsai and Ghoshal (1998) yielded compelling results, highlighting the superior performance outcomes of teams with high levels of social capital, including enhanced innovation and productivity. In a similar vein, a meta-analysis raised by Wang et al. (2019) corroborated the significant positive impact of social capital on team performance across diverse industries and contexts. Teams characterized by heightened social capital exhibit superior abilities in organizing and synchronizing their efforts, engaging in productive communication, and establishing a foundation of trust among team members. Consequently, these teams are better equipped to address complex problems and make well-informed decisions, thereby leading to overall improved performance.

The assertion that social capital directly influences team performance is substantiated by the following hypotheses, as supported by empirical evidence:

Extensive research has focused on establishing the positive impact of strong leader-member relationships, characterized by high-quality communication, trust, and cooperation, on team performance. Li and Liao (2014) provided empirical validation for the positive correlation between high-quality leader-member relationships and team performance. Similarly, Gerstner and Day (1997) with a meta-analysis,

which further supports the notion that positive leader-member relationships are significantly associated with higher levels of team performance, as well as other favorable outcomes such as job satisfaction and organizational commitment.

H1a: Leader members' relationships have a positive effect on Team performance.

Liang et al. (2012) showed that there is a positive relationship between social network centrality and team performance, thereby indicating that robust connections among team members can enhance overall team efficacy. These findings underscore the significance of cultivating favorable interpersonal relationships within teams to optimize their performance. Existing research has consistently demonstrated that increased levels of relationship conflict are inversely associated with team performance, whereas stronger relationships and greater social network centrality exhibit positive correlations with team performance.

H1b: Relationships among members have a positive effect on Team performance.

The existing body of literature provides evidence supporting the notion that team investment positively influences team performance. Numerous studies have underscored the critical role of accessing financial resources in determining team success. For instance, Li and Hambrick (2005) revealed that teams with access to financial resources outperformed those lacking such resources. The authors attributed this finding to the fact that financial resources enable teams to invest in essential elements like training and equipment, which are pivotal in achieving optimal performance. Furthermore, Scandura and Williams (2004) state firmly that corroborating that teams receiving investor support demonstrated superior levels of job performance and team efficacy.

H1c: Team investors have a positive effect on Team performance.

Several studies suggest that team mentors can serve as a valuable asset for teams, facilitating positive team dynamics that contribute to enhanced team performance. Sosik and Godshalk (2000) revealed teams receiving mentorship support exhibited higher levels of job satisfaction and commitment to the team, consequently leading to enhanced performance. Furthermore, the study highlighted the significance of mentors who demonstrated transformational leadership behaviors, such as offering individualized support and encouraging team members' personal growth and development, as they had a notably positive effect on team performance

H1d: Team mentors have a positive effect on Team performance.

The question of whether a sense of community can positively influence team performance has garnered increasing scholarly attention. Li and Hambrick (2005) put forth the proposition that teams characterized by a strong sense of community are more likely to exhibit heightened levels of cooperation, commitment, and trust among team members, which subsequently leads to improved performance outcomes. Similarly, Lu et al. (2019) found a correlation between community and team creativity and innovation. Their research demonstrated that teams with a strong sense of community displayed a greater propensity for knowledge and resource sharing, engaged in collaborative problem-solving, and generated novel ideas, thereby fostering innovation within team processes and positively impacting performance outcomes.

H1e: Community has a positive effect on Team performance.

2.2. Team efficacy

2.2.1. Literature review of Team efficacy

“Team efficacy” originates from “self-efficacy” and emerges as a result of team processes that involve social interaction and mutual task execution experience, where the personal efficacy beliefs of team members converge into a collective factor at the team level (Kozlowski and Klein 2000). Despite having individual efficacy beliefs, team members may also possess beliefs about the collective abilities of the team (Bandura 1986; Mesch, Farh, & Podsakoff, 1989; Shamir, 1990). Many scholars have focused their investigation on team efficacy as a shared attribute of groups, which is possessed collectively by each member (Bandura, 1997; Zaccaro et al., 1995).

2.2.2. Literature review about Team efficacy and Team performance

Earlier scholars have advocated the belief that team efficacy has a positive impact on team performance. For instance, William S. Silver and Kristina M. Bufanio (1996) investigated the correlation between team efficacy and task performance of the team, and the findings of their study provided empirical evidence that team efficacy had a strong and significant relationship with task performance. Additionally, Fuller et al. (2006) showed that virtual teams with higher levels of team efficacy had better performance outcomes and achieved more favorable team results. Consequently, we formulate the following hypothesis:

H2: Team efficacy have a positive effect on team performance

2.2.3. Literature review about the mediating role of Team efficacy

Previous scholarly investigations have indicated that social capital holds the potential to serve as a valuable asset (e.g. Bolino et al., 2002) owing to its diverse array of outcomes that are inherently linked to it. Given that social capital is a comprehensive metric encompassing various factors, including two primary dimensions: internal and external social capital, several studies have proposed that several dimensions of social capital, such as trust, team identity, and task execution abilities, well-being at work (Rich, 1997), and more cooperative behavior (Costa et al, 2009). When individuals possess the autonomy, confidence, and expectations to execute their responsibilities effectively, they tend to be more motivated and dedicated to their teams, thus enhancing team performance (Kara A. Arnold, et al, 2001). These aforementioned aspects correspond to team efficacy dimensions, such as efficacy beliefs and members' expectations for their team performance. In light of these findings, we arrive at the following hypotheses:

H3a: Team efficacy mediates relationship between Relationships among members and Team performance.

H3b: Team efficacy mediates relationship between Leader members' relationships and Team performance.

H3c: Team efficacy mediates relationship between Team investors and Team performance.

H3d: Team efficacy mediates relationship between Team mentors and Team performance.

H3e: Team efficacy mediates relationship between Communities and Team performance.

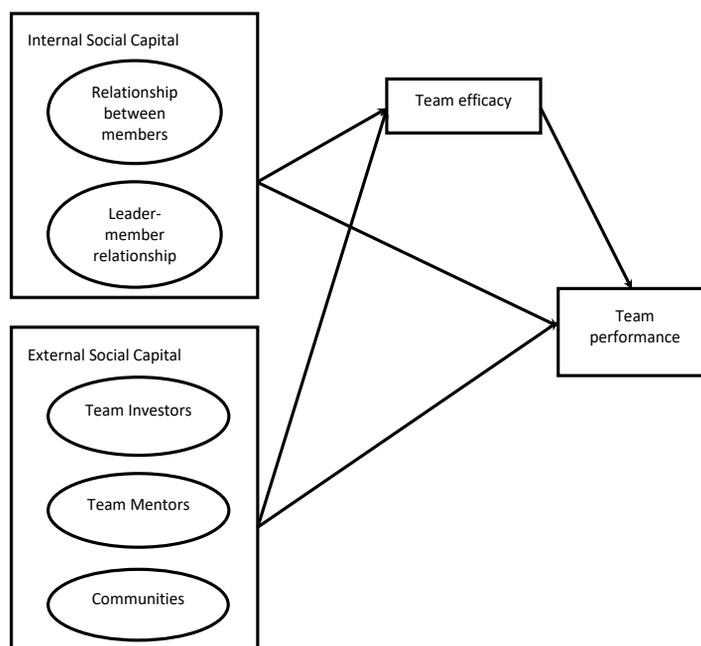

Figure 1. Model 1 – Impact of Social capital on Team performance via Mediating role of Team efficacy

2.3. Shared leadership

2.3.1. Literature review of Shared leadership

The genesis of the study into shared leadership can be traced back to Gibb’s (1954) proposition of two leadership forms: distributed and focused leadership. Elaborating on Gibbs’ original idea, shared leadership can be defined as the collective influence of team members on each other (Sivasubramaniam et al, 2002). In the current research, shared leadership is predominantly explored in unpredictable contexts and dynamic environments, such as global virtual teams and the Covid-19 pandemic (Nordback et al., 2019; Castellano et al., 2021). As the global economy and society are in a state of constant evolution, these research trends are anticipated to be further developed.

2.3.2. Literature review about the moderated mediator of Shared leadership

Many empirical studies have illustrated the positive impact of shared leadership on team performance in diverse contexts, such as undergraduate student teams (Avolio et al., 1996), change management teams (Pearce and Sims, 2002), and virtual teams (Pearce et al., 2004). External social capital facilitates access to valuable resources (Mizruchi, 1996; Pfeffer and Salancik, 1978) and opportunities to collaborate with other organizations (Koenig et al., 1979), while internal social capital can result in knowledge exchange and combination, leading to knowledge integration, which in turn affects the competitive advantage of organizations. Therefore, teams with a shared sense of collective competence among members are more likely to integrate their resources and knowledge to achieve successful concerted responses to specific situational tasks. Similarly, Wencang Zhou et al. (2013) have suggested that shared leadership can promote this resource combination process within innovative teams and enhance the efficacy of social capital. Thus, we posit that the effective combination of social capital significantly impacts team performance. Thus, we propose the following hypotheses:

H4a: Shared leadership moderates the mediating role of Team efficacy of relationship between Leader members’ relationships to Team performance.

H4b: Shared leadership moderates the mediating role of Team efficacy of relationship between Relationships among members to Team performance.

H4c: Shared leadership moderates the mediating role of Team efficacy of relationship between Team investors to Team performance.

H4d: Shared leadership moderates the mediating role of Team efficacy of relationship between Team mentors to Team performance.

H4e: Shared leadership moderates the mediating role of Team efficacy of relationship between Community to Team performance.

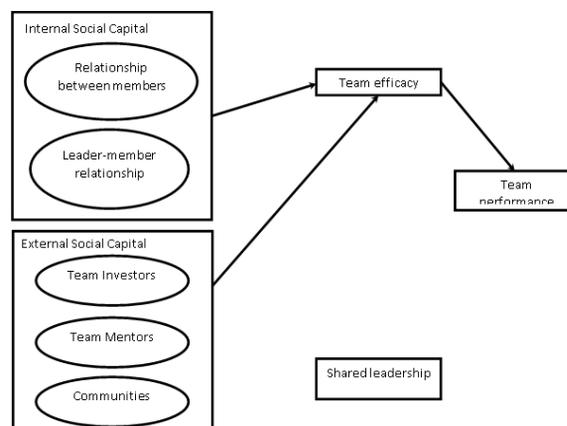

Figure 2. Model 2 – Impact of Social capital on Team performance via Moderated mediating role of Shared leadership

3. METHODOLOGY

3.1. Measurement

The survey comprises four main sections: Part I - General information; Part II - Evaluation of the impact of social capital (using factors identified in the research model); Part III - Evaluation of the influence of shared leadership (using factors derived from prior studies); Part IV - Evaluation of the significance of team efficacy (using factors derived from prior studies); Part V - Assessment of the performance of innovative teams.

The research team employs a Likert scale ranging from 1 to 7 (1 - Strongly disagree to 7 - Strongly agree) to measure the components of social capital, team efficacy, shared leadership, and team performance.

3.1.1. Measurement of "Internal social capital" variable

The measurement of Internal social capital in this study encompasses two primary scales: Relationship between members and Leader-member relationship. The measurement of relationships between members is based on the previous studies conducted by Pastoriza and Ariño (2013) and Ruiz-Palomino et al. (2021). It consists of 10 questions, including items such as "In my team, members engage in open and honest communication with one another" and "Our members share the same ambitions and vision with others at work." Furthermore, the measurement of Leader-member relationship draws upon the research conducted by Graen et al. (1995), Qi et al. (2019), and Tran et al. (2020). It includes items such as "My leader would be personally inclined to help me solve problems in my task" and "My leader and I are suited to each other."

3.1.2. Measurement of "External social capital" variable

The concept of external social capital in this study comprises three key elements: Team investors, Team mentors, and Communities. The measurement of Team investors is based on the seminal work of Lowell W. Busenitz et al. (1997), with the questionnaire adapted to the specific context of innovative team performance. Illustrative questions include "Our investors demonstrate a willingness to compromise with us" and "Our investors actively support the development of new team ideas." Similarly, the measurement of Team mentors draws upon the research conducted by C-Y Huang et al. (2015), with questions such as "We have a positive rapport with our mentors" and "The expertise of our mentors aligns well with our pursuits." While Communities represent a novel variable in social capital research, the authors identified pertinent prior studies and formulated questions, such as "Our team experiences enhanced team cohesion and identification when positively recognized by the community."

3.1.3. Measurement of "Shared leadership" variable

The authors have drawn upon research conducted by Mayo et al. (2003), Carson et al. (2007), Mathieu et al. (2015), Chiu et al. (2016), and Siangchokyoo et al. (2021) to formulate questions related to Shared leadership. The selected questions from these studies, deemed most suitable for measuring the Shared leadership variable in this study, include statements such as "My team leader provides a clear vision of where our team is going" and "My team leader works with me to develop my performance goals."

3.1.4. Measurement of "Team efficacy" variable

In order to assess Team efficacy, the authors have incorporated four questions inspired by the study conducted by Short et al. (2005). These questions include statements such as "Our team has the ability to perform under pressure" and "Our team has the ability to demonstrate a strong work ethic."

3.1.5. Measurement of “Innovative team performance” variable

The dependent variable, Innovative team performance, is assessed through six statements. These statements have been selected and modified by the authors based on the study conducted by Pearce et al. (1994), in order to align with the specific context of this research. Examples of these statements include “Our resource planning and allocation are superior to those of similar teams in other organizations” and “This team has achieved high performance.”

3.2. Data collection

The study collected data from leaders and members of innovative startup teams participating in notable student competitions in Vietnam, including “Kawai Business Startup” (KBS) and “Vietnam Social Innovation Challenge” (VSIC).

A minimum sample size of 115 participants was determined based on the formula of $5 \cdot m$, where m represents the number of observed variables. The study received a total of 201 responses over a 4-month period, out of which 199 responses were deemed valid for analysis, after excluding incomplete submissions.

Descriptive statistics were calculated using SPSS 20.0, while SmartPLS 4.0 was utilized to perform PLS-SEM analysis. The analysis aimed to assess the impact of Social capital on Innovative team performance, as well as examine the mediator role and moderated mediator effects of the Team efficacy and Shared leadership variables.

4. RESULTS

4.1. Statistics description

Although 201 responses have been collected nationwide, only 199 have been deemed valid for use in statistics and analysis. Results of variable descriptive statistics are displayed in the table below. Each variable has 199 observations. In this table, “RB” stands for “Relationship between members”, “LMR” shows “Leader-member relationships”, “TI” shows “Team investors”, “TM” presents “Team mentors”, “C” indicates “Communities”, “SL” is “Shared leadership”, “TE” is “Team efficacy” and “TP” shows “Team performance”.

According to the Table 1 below, all observations reached the highest score – 7 (strongly agree). Shared leadership has the largest mean (5.469849) while Team investor has the smallest mean (4.545226). Leader-member relationships have the smallest standard deviation (1.170453) and Communities have the largest standard deviation (1.294437).

Table 1. Descriptive statistics of variables

Variable	Mean	Standard deviation	Min	Max
RB	5.114322	1.455505	1	7
LMR	5.275544	1.170453	1	7
TI	4.545226	1.208332	1.5	7
TM	5.00691	1.192635	1	7
C	5.041876	1.294437	1	7
SL	5.469849	1.124243	1.375	7
TE	5.221106	1.278792	1	7
TP	5.043551	1.212103	1	7

Source: Authors’ calculation.

4.2. Reliability and Validity of Measurement Scales

All factors satisfy the minimum requirements (Table 2), with a composite reliability (CR) of ≥ 0.7 and an average variance extracted (AVE) of ≥ 0.5 . The (unreported) variance inflation factor (VIF) values are all below 3, indicating there is no significant multicollinearity among the independent variables.

Table 2. Properties for measurement

	Cronbach's alpha	Composite reliability	AVE
C	0.898	0.936	0.83
LMR	0.919	0.934	0.704
RB	0.946	0.961	0.86
SL	0.933	0.946	0.715
TE	0.95	0.961	0.832
TI	0.81	0.912	0.838
TM	0.935	0.947	0.692
TP	0.937	0.95	0.761

Source: Authors.

4.3. Hypothesis testing

Table 3. Results of structural model

	Original sample	Sample mean	SE	t	P values
C -> TE	0.566	0.564	0.079	7.176	0.000
C -> TP	0.058	0.065	0.081	0.717	0.474
LMR -> TE	-0.041	-0.037	0.055	0.747	0.455
LMR -> TP	0.017	0.019	0.056	0.299	0.765
RB -> TE	0.171	0.165	0.077	2.229	0.026
RB -> TP	0.047	0.045	0.041	1.148	0.251
TE -> TP	0.625	0.619	0.080	7.804	0.000
TI -> TE	-0.008	-0.010	0.040	0.194	0.846
TI -> TP	0.074	0.074	0.041	1.796	0.073
TM -> TE	0.203	0.208	0.075	2.700	0.007
TM -> TP	0.158	0.158	0.074	2.136	0.033
C -> TE -> TP	0.354	0.348	0.063	5.654	0.000
TI -> TE -> TP	-0.005	-0.006	0.025	0.195	0.845
TM -> TE -> TP	0.127	0.128	0.048	2.629	0.009
LMR -> TE -> TP	-0.026	-0.024	0.035	0.730	0.466
RB -> TE -> TP	0.107	0.103	0.053	2.014	0.044

Source: Authors.

We used Bootstrap analysis to examine hypotheses H1, H2 and H3. Table 3 indicates that TM has a positive correlation with TP ($\beta = 0.203$, $p = 0.007$), while TE has a strong positive effect on TP ($\beta = 0.625$, $p = 0.000$), thereby validating H1d and H2. The outcomes of Model 1 reveal that there were no significant relationships between RB and TP ($p = 0.251 > 0.05$), LMR and TP ($p = 0.455$), TI and TP ($p = 0.846$), and C and TP ($p = 0.474$), leading to the rejection of hypotheses H1a, H1b, H1c, and H1e.

According to the analysis of the data and hypotheses, the indirect effects of LMR and TI on TP through TE were found to be statistically insignificant (p values = 0.845 and 0.466 respectively > 0.005), which leads to the rejection of H3b and H3c. Only the paths of C -> TE -> TP, TM -> TE -> TP, and RB -> TE -> TP were supported by the empirical data (p values < 0.05) (H3a and H3e were supported). Thus, there is

an intermediate effect in the research model, where team efficacy acts as a mediator in the transmission of effects from RB, TM, and C to TP. Although RB -> TE -> TP and C -> TE -> TP are statistically significant, the direct effects of RB -> TP and C -> TP are not statistically significant. Hence, the team efficacy variable serves as a full mediator in the relationship between RB, C to TP.

Table 4. Results of 2.5% and 97.5% percentile values

PERCENTILE LOWER (2,5%)	0.196
PERCENTILE UPPER (97,5%)	0.888

Source: Authors.

The representative VAF value is calculated as:

$$VAF = \frac{0.127}{0.285} = 0.45$$

After conducting 5000 Bootstrap samples of both the total indirect effect and total effect, and calculating by Excel, the results (Table 4) show that VAF values in the range of the 2.5th to 97.5th percentile vary between 0.196 and 0.888, not including zero. The above equation signifies that 45% of the impact of team mentors on team performance can be elucidated through team efficacy. Therefore, H3d is partially mediated.

4.3.1. Testing for moderated mediation

Table 5. Process macro testing

Path	Hypothesis	β	p	LLCI	ULCI	Decision
Conditional indirect effect:						
SL x RB -> TE -> TP	H4a	0.077	0.027	0.221	0.259	Rejected
High: +1 SD		0.022	0.159	0.070	0.108	
Low: -1SD		0.101	0.121	0.001	0.201	
SL x LMR -> TE -> TP	H4b	0.057	0.001	0.001	0.016	Supported
High: +1 SD		0.138	0.005	0.0004	0.0157	
Low: -1SD		0.062	0.003	0.0125	0.0038	
SL x TI -> TE -> TP	H4c	0.053	0.053	-0.002	0.105	Rejected
High: +1 SD		0.119	0.031	0.22	0.48	
Low: -1SD		0.082	0.034	0.01	0.13	
SL x TM -> TE -> TP	H4d	0.233	0.002	0.1	0.453	Supported
High: +1 SD		0.254	0.001	0.08	1.11	
Low: -1SD		0.129	0.001	-0.01	-0.63	
SL x C -> TE -> TP	H4e	0.34	0.007	0.127	0.573	Supported
High: +1 SD		0.41	0.036	0.25	0.41	
Low: -1SD		0.101	0.027	0.09	0.14	

Note: N = 199; Bootstrap sample size = 5000, BC 95%, CI = Bias - corrected 95% Confidence Interval; LLCI = Lower limit of confidence interval; ULCI = Upper limit of confidence interval

Source: Authors.

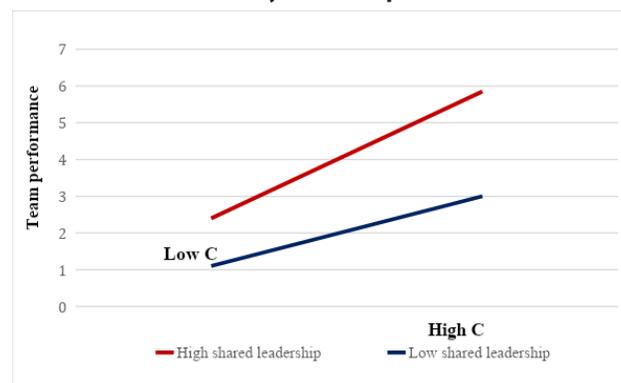

To examine the fourth hypothesis, we used the outcome obtained from the PROCESS macro for model 2. The bootstrapping results presented in Table 5 indicate that the conditional indirect effect of RB on TP was not significant at both high ($\beta = 0.022$, $p = 0.159 > 0.05$, LLCI = 0.07, ULCI = 0.108) and low levels of

SL ($\beta = 101, p = 0.121 > 0.05, LLCI = 0.001, ULCI = 0.201$). As moderated mediation was not evident, H4a was rejected. Similarly, the indirect relationship between TI and TP through TE was insignificant at a high level of SL ($\beta = 0.053, p = 0.053 > 0.05, LLCI = -0.002, ULCI = 0.105$). Thus, the outcome rejects H4c.

When SL was higher (+1 SD), the indirect effects of LMR on TP through TE became stronger ($\beta = 0.138, p = 0.005, LLCI = 0.07, ULCI = 0.108$). The indirect effects were weaker when SL was lower (-1 SD) ($\beta = 0.101, p = 0.041, LLCI = 0.0004, ULCI = 0.0157$). These findings indicate that SL moderates the mediated relationship between LMR and TP through TE, supporting Hypothesis 4b.

As shown in Table 5, the conditional indirect association between TM and TP was found to be statistically significant across all three levels of SL. However, the indirect relationship was stronger with higher SL as opposed to lower SL, supporting H4d.

Figure 3. Moderated mediation effect of shared leadership on the correlation between community and team performance

Source: Authors.

Finally, the results (Table 5) indicated that SL plays a positive moderating role in the relationship between C and TP ($\beta = 0.340, p = 0.007, LLCI = 0.127, ULCI = 0.573$). Figure 3 illustrated a strong interaction effect between C and TP in fostering a positive C, where a steeper slope was observed for higher levels of SL compared to lower levels. Therefore, it can be concluded that hypothesis H4e was accepted.

5. DISCUSSION

This study investigates the roles of shared leadership, or mediated mediator, in the relationship between social capital and the performance of innovative teams. In the context of sales teams (Mehra et al. 2006), undergraduate student teams (Avolio et al. 1996), etc., the effects of shared leadership on team performance have also been thoroughly researched in the past. It has also been previously suggested that shared leadership plays a mediating role in the relationship between social capital and team performance (Nicolaidis, VC et al., 2014; Hoch, JE, 2014). In contrast to earlier studies, the role of shared leadership in this investigation is that of a moderated mediator.

Despite the fact that only Team mentors have a positive impact on Team performance (hypothesis H1d), the remaining hypotheses are disproved by the findings on the effects of each independent variable on the dependent variable. The dependent variable is not directly impacted by the two independent variables (relationships between members and communities), but they do impact other independent variables indirectly through the mediating factor team efficacy.

First, hypothesis 1d predicted that the team performance would be directly and positively influenced by team mentors (direct effect = 0.203, 90%). Overall, the team mentors had a direct

impact on team performance. Because the mentors are the ones who oversee, counsel, and direct the team throughout the competition from research to implementation. The team's performance would be directly impacted by these orientations. On the other hand, by offering techniques for the team to use, mentors also provide feedback, which the teams may use to make adjustments and improve performance. This result is also supported by the research of (Iacob and Faily, 2020), during the two academic years from 2018 to 2019, team performance correlated significantly with the team attendance record in the mentorship sessions ($r=0.52$, $p<.01$).

In addition, the results of this study (Hypothesis H2 supported) add to prior research and advanced empirical study of the factor, showing that team efficacy influences innovative teams, aiding teams in overcoming challenges, fostering higher team performance, encouraging teams to achieve goals, and producing excellent results. The outcome additionally demonstrates that team mentors have a favorable, indirect association through team potency with team performance ($r=0.127$, 90%) (Hypothesis H3d).

Through team efficacy acting as the mediator, it was hypothesized that leader member relationships (LMR) and community were related to team performance ($r=0.107$, 95%, and $r=0.354$, 99%, respectively) (Hypothesis H3a, H3e). Through the mediating variable, both of the two factors have an indirect effect on the team's performance. However, the community variable has a bigger impact on the regression coefficient than the LMR variable. This demonstrates how crucial it is for the team to have community support when innovating.

The results showed that SL has a moderated mediating influence on the relationships between TM and TP, C, and TP via TE, as was expected. These findings imply that team efficacy may be enhanced by shared leadership in mediating the relationship between TM and TP as well as C and TP. More precisely, creative teams with strong shared leadership can foster communication and knowledge sharing among all team members and mentors, which strengthens mutual trust and boosts team productivity. On the other side, members are more likely to use community resources when a team adopts a high level of shared leadership (SL), as SL places an emphasis on equal positions for all people.

6. IMPLICATIONS AND LIMITATIONS

This study contributes to the understanding of the impact of social capital and shared leadership on the performance of innovative teams. The use of shared leadership as a mediator/moderator is highlighted as a key factor in promoting innovation and collaboration within teams. The study suggests that stakeholders such as government, organizations, students, and universities can benefit from promoting shared leadership training programs and incorporating shared leadership principles into their practices to foster a collaborative culture that supports innovation. The authors suggest that start-up teams should consider setting up mentor positions to improve team performance, and that shared leadership has a positive effect on team performance, making it a valuable leadership style for promoting innovative team performance.

This study aimed to evaluate the mediating role of team efficacy and the moderating role of shared leadership in the relationship between internal social capital (including relationships among members and leader-member relationships) and innovative team performance. However, the study found no direct relationship between internal social capital and innovative team performance. The study proposed and adjusted the measurement of two new variables, team investors and communities, based on relevant research and the Vietnamese context. The literature review was limited due to time constraints and availability of documents. The study was conducted in Northern Vietnam, which may limit the generalizability of the results to other regions.

7. CONCLUSION

This study introduces different dimensions of social capital, encompassing internal social capital (relationship among members; leader-member relationships) and external social capital (team investors, team mentors, and communities). These comprehensive dimensions shed light on the influence of social capital on team performance in student innovative teams.

The research examines the association between social capital and team performance through the lenses of team efficacy and the moderating role of shared leadership. While the direct positive effect of team mentors on team performance was observed, this study breaks new ground by considering other valuable resources such as financial investment and mentor guidance. Previous research has primarily focused on intangible aspects of social capital, making this study unique in its broader perspective.

A significant finding of this study is the full mediation effect of team efficacy, which mediates the relationships between relationships among members, communities, and team performance. Additionally, team efficacy partially mediates the association between team mentors and team performance, as team mentors still exert direct effects on performance.

In summary, this study adopts a comprehensive evaluation of social capital, investigates the mediating role of team efficacy, and reveals the concept of shared leadership as a moderated mediator. By expanding the understanding of social capital's influence on team performance, this research contributes to the existing literature and offers valuable insights for practitioners and scholars alike.

FACTORS AFFECTING ENTREPRENEURIAL INTENTION OF STUDENTS AT FOREIGN TRADE UNIVERSITY IN HO CHI MINH CITY

**Author: Nguyen Le Yen Nhi¹, Nguyen Thi Khanh Ngoc²,
Dang Ngoc Phuong Mai², Nguyen Thanh Lam²
Mentor: Huynh Dang Khoa²**

ABSTRACT: *As entrepreneurship plays a crucial role in providing job opportunities, fostering economic growth, and ensuring a stable society, it should be encouraged among people. Therefore, it is necessary that entrepreneurial intention should be nurtured, especially in students, who will make up the majority of the workforce in the future. This research aims to examine the effect of individual entrepreneurial orientation elements, family environment, and entrepreneurial education on entrepreneurial intention to create a new business among students of Foreign Trade University in Ho Chi Minh City. Furthermore, feasible ways the university can help students prepare for future entrepreneurship were also proposed in the research. Also, the impact of gender, a moderating factor, is also evaluated. The set of hypotheses was tested via a survey to a sample of over 200 students of this university, using both qualitative and quantitative methods with statistical analysis including descriptive statistics, Cronbach's Alpha, EFA, correlation and regression. The results have shown that individual entrepreneurial orientation and entrepreneurial education have strong influence on entrepreneurial intention while family background and gender show no significant impact.*

Key words: *entrepreneurial intention, IEO, entrepreneurial education, family environment, gender*

1. INTRODUCTION

Entrepreneurship is one of the chosen strategies to be adopted and acknowledged in order to provide jobs for young people, foster economic progress, and ensure a stable and peaceful society (Schumpeter, 2000). The entrepreneurship sector has experienced tremendous growth these years, and Vietnam is no exception, ranking 54th of 100 nations globally (Startupblink, 2021). To support and promote the Career and Entrepreneurship activities of young people, the Prime Minister signed a decree to promulgate the Project “Supporting Students to Start a Business by 2025”. However, in reality, the start-up rate among students is still low, most students after graduating from colleges and universities tend to apply for jobs in operating businesses, and only a few want to start a business by themselves. Almost 66% of Vietnamese students are not really interested in start-up (VCCI, 2019).

Foreign Trade University in Ho Chi Minh City is known as one of the leading economics universities in the south of Vietnam. Many contests and projects related to entrepreneurial activities are offered to aim at giving students the chance to brainstorm, form and make feasible plans to execute workable business strategies. However, most ideas just stop there. Even students studying majoring in economics typically opt to work for an organization with competitive pay rather than launch their startup after graduation. This can be attributed to the fear of failure due to the fierce competition they might encounter or the lack of knowledge, skills, experience, or financial support.

According to Krueger and Brazeal (1994), the intention for entrepreneurship is the foundation for entrepreneurship behavior. Much research have been conducted in this field of entrepreneurial intention among universities in order to figure out the most effective methods for teaching students to be properly

¹ Foreign Trade University, Email: nguyenleyennhi2011155421@ftu.edu.vn

² Foreign Trade University.

prepared before engaging in entrepreneurial activity. Research by Wei-Loon Koe (2016) assessed the impact of Individual Entrepreneurial Orientation on the entrepreneurial intention of university students, implying the intention was affected by the quality of proactiveness and innovativeness within themselves. Also, Vodã et al. (2019) found that personality traits matter to entrepreneurial intention of business students, explaining that one who has a high level of need for achievement and control, which in practice would predict a high potential for entrepreneurial intent. Regarding the same research, many factors are worth discussing, including entrepreneurial education and gender. Entrepreneurial education has a significant positive impact on college students' entrepreneurial intention, however, it does not have a significant impact on their entrepreneurial attitude. Earlier research by Zhao and Seibert (2005) and Ibrahim et al. (2016) indicated that engagement in education positively impacts entrepreneurial intentions; and later by Rui Fragoso et al (2019). In terms of gender, research of Vodã found out that women have lower intentions to engage in start-up activities than males, which is also supported by research of Zhao and Seibert (2005). Finally, other research results show that family also impacts the intention to start a business Lindquist et al., (2015) and Fatoki (2015).

There are so many ways of researching the topics of entrepreneurial intention, each provides valuable findings. However, because the researches were conducted across many countries, with different methods, scopes, scales and sample sizes, results vary significantly. Therefore, results of one research are doubtfully applicable to other contexts. In order to provide a thorough and effective research and suggestion to the subject herein Foreign Trade University in Ho Chi Minh City, the author decided to combine all of the statistically proven as positive and relevant factors derived from empirical researches to this paper. Other factors that have signs of positive relationship but have not been cleared and well-developed yet are modified as independent variables for further investigation. The author also uses qualitative research methods in the process of collecting, synthesizing, and analyzing theoretical bases to develop appropriate research models as well as build scales to evaluate and analyze data. clarify the results of quantitative research. The research process is conducted through two main stages: (1) Preliminary research and (2) Formal research through field survey and primary data analysis based on collected data. In addition, this study was conducted with the aim to determine the factors affecting the entrepreneurial intention of students studying at Foreign Trade University in Ho Chi Minh City.

2. THEORETICAL FRAMEWORK

2.1. IEO elements

Some of the individual entrepreneurial orientation (IEO) elements were proven to have a positive relationship with business performance (Chien, 2014; Bolton (2012). Robinson and Stubberud (2014) defined IOE as an individual level construct, originating from the concept of entrepreneurial orientation (EO) by Miller (1983) which consists of three dimensions, namely innovativeness, pro-activeness and risk-taking. Specifically, proactiveness requires entrepreneurs to seek, secure and utilize valuable business opportunities (Bolton and Lane, 2012). Meanwhile, innovativeness is related to engaging new ideas to produce new products, services or processes against the increasing competitive business landscape. Finally, risk-taking ability assumes an individual's intention on taking up entrepreneurial activities (Yurtkoru et al., 2014; Bolton and Lane, 2012).

At Foreign Trade university of HCM city (FTU2), the education program is designed to develop the strengths of their students and improve their weaknesses by allowing them to be proactive, independent, and responsible for their learning and participating in extracurricular activities, especially in organizing a school club. To manage a club, the board of management has to master the human & risk management skills, innovations skills and . Therefore, with the experience in being responsible for an organization, challenging in creating concepts for every event of the organization, the author confides that the skills of IEO is fully equipped within every student of FTU2.

2.2. Family environment

For gifted individuals, the family has been regarded as the most important factor in transforming talent, skill, and promise into achievement (Olszewski et al., 1987). Family shapes their behavior, their ways of solving problems, and in particular, how they make decisions (Figueiredo & Dias, 2012). Creatively gifted children have family environments that stress independence rather than interdependence, are less child-centered, have tense family relationships and more expression of negative affect resulting in both a cognitive freeing and motivation to attain power or leadership (Olszewski et al., 1987). According to research conducted by Lindquist et al. (2015) and Fatoki (2015), the home environment (i.e., transitions, resources, and norms, attitudes, and values) has a beneficial influence on an individual's eagerness to launch a business venture (i.e., identify opportunities, determine whether to launch, mobilize resources, and put founding strategies, processes, and structures into place). Parental support will influence the willingness in doing entrepreneurship (Irine, 2017).

FTU2 students have a good family background. Their family supports them in achieving skills and knowledge in many ways such as supporting financial conditions, and emotional sharing. Thus, FTU2 students are assured to follow their dream and to pursue their passion to become the one that they want to be in the future even become a businessman or business woman.

2.3. Education

According to Bates (1995) and Bowen and Hisrich (1986), those who establish their own businesses have a greater level of education compared to those who do not. Nevertheless, it has been argued that formal education, in general, does not promote entrepreneurship. However, specialized courses and education in enterprises have been associated with promoting entrepreneurial behavior through the study provided by Peterman and Kennedy (2003). A positive relationship between education and business set-up was established by Lüthje and Frank (2003). Kimwolo, Saina, and Cheserek (2012) stated that training and entrepreneurial education could enable students to acquire the skills required to create a new venture and manage a business. Early exposure to entrepreneurial training and education might be particularly effective in promoting interest in entrepreneurship as discussed by Dyer (1994).

When it comes to entrepreneurial education, Foreign Trade University in Ho Chi Minh City has organized various courses, seminars, workshops, and office visits to orient students towards entrepreneurship. Also, different entrepreneurial contests have been held to raise students' interest in entrepreneurship.

In this paper, we would examine whether entrepreneurial training courses at the university leaves a significant effect on the entrepreneurial intention of students. Also, the rate of participation in extracurricular activities of students should be considered.

2.4. Moderating factor: Gender

Fagenson and Marcus (1991) illustrated that male dominance was more linked to entrepreneurship. Seibert et al. also had the same conclusion that entrepreneurial intention in men is higher than in women in their research in 2005. Females having fewer opportunities to be self-employed can be explained by the continuation of gender-specific restrictions, according to Verheul et al., (2012). From the research of Haus et al. (2013), it could be implied that compared to men, women typically exhibit lower levels of entrepreneurial attitudes, perceived behavior control, and subjective norms.

This paper will examine the difference in entrepreneurial intention between male and female students of Foreign Trade University in Ho Chi Minh City. The author would concentrate on analyzing the potential moderating effect of gender along with IEO elements, family environment, and entrepreneurial education on the students' intention to engage in entrepreneurial activities in accordance with the theoretical conclusions above.

2.5. Research model and hypotheses

Based on the above three sub-sections on theoretical and empirical contributions to explaining business start-ups, the research model is presented in Illustration 2.4.

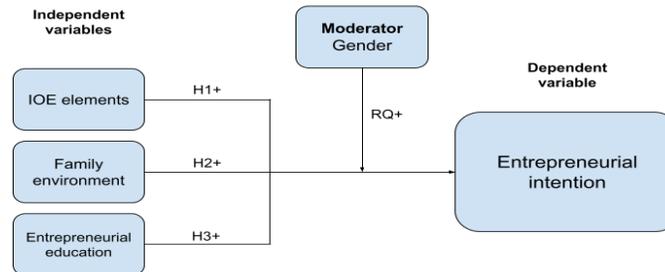

Illustration 2.1. Author’s suggested research model

Based on the referred theory and the model above, we set forth the following hypotheses for empirical analyses in this paper:

H1: Individual entrepreneurial orientation has a positive relationship to the entrepreneurial intention of university students.

H2: The family environment has a positive relationship to the entrepreneurial intention of university students.

H3: Entrepreneurial education has a positive relationship to the entrepreneurial intention of university students.

RQ: Will gender modify the impact of IEO elements, self-efficacy, family environment, and entrepreneurial education on the entrepreneurial intention of university students?

3. RESEARCH METHOD

3.1. Research design

3.1.1. Research procedure

The research procedure was divided into two periods, that is preliminary research and official research. During the periods, the author used both qualitative and quantitative research based on empirical study and direct survey results from Google Form platform, then performed analysis on the data gathered.

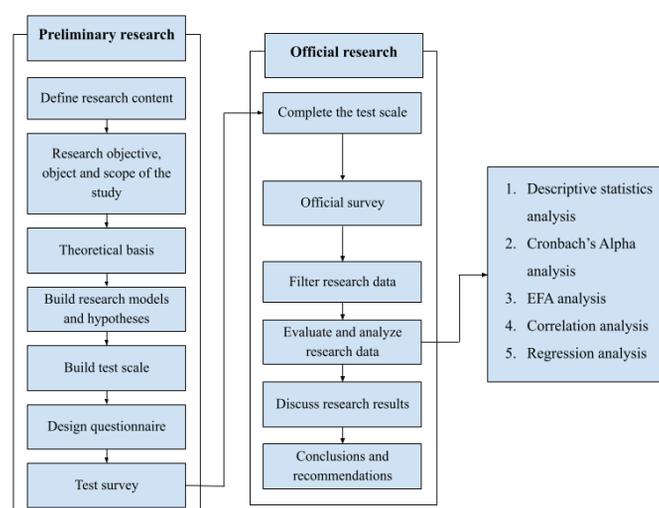

Illustration 3.1: Research procedure

The author uses Likert five-point scale to measure how much individuals agree or disagree with specific statements as observed variables which will raise the participant's response rate as according to Babakus et al. (1992). From there, the author has a complete survey with 21 questions and divided into 2 main parts. Part one consists of filtered questions such as gender, and level of education with two options "Yes" or "No. Part two includes 18 main questions expressed in the form of statements and is evaluated by the Likert 5 scale (1 - Totally disagree; 5- Totally agree). For each element in the research model, the author uses 5 - 6 questions to ask the opinions of students studying at Foreign Trade University in Ho Chi Minh City.

3.2. Sources and data collecting methods**3.2.1. Preliminary research**

Before official research, the author conducted a trial online research with the participants of 90 university students in Ho Chi Minh City from February 1 to March 1, 2023. Conducting this trial research helps the author to assess the understandable and reasonable rate of the questions and complete the scale of this research. In addition to the process, the author also contacted M.S Huynh Dang Khoa, a lecturer of Foreign Trade University at Ho Chi Minh City for instructions and advice via email.

3.2.2. Official research

In this step, the author conducted a survey of students of Foreign Trade University in Ho Chi Minh City about their intention to start their own business. The survey was carried out from March 1, 2023 to March 25, 2023 and the data was only collected online through Google Form and was sent through different social networking sites such as Email, Facebook, and Zalo. In order to ensure the reliability, validity, and representativeness of the research, the author needs the sample size being at least 5 times greater than the number of observable variables examined (Hair et al., 1998). The author has 19 observed variables in total, and at the same time, the number of acceptable and reasonable answers are 209 out of 223 answers received, which accounts for 93.27%. Therefore, it is clear that the sample size meets the requirements for further EFA analysis.

3.3. Data analysis methods

Firstly, descriptive statistics methods were used to present the results obtained in a systematic and intuitive manner. Then, the author used Cronbach's Alpha test to check the accuracy and internal consistency of the observed variables in the scale and determine the reliability of the questions. After that, the exploratory factor analysis EFA was used to examine the relationship between variables in all different factor groups and check if there were any observed variables that had not reached the standard load factor due to too little contribution to the model. Next, correlation analysis was used to analyze quantitative data collected through research methods like surveys and live polls. This method helped to identify the relationship, patterns, significant connections, and trends between two variables or datasets. Furthermore, the author included Multiple Linear Regression in the paper to analyze the relationship between the independent variable and dependent variables, using three tables ANOVA, Model Summary, Coefficients. Finally, a macro process was applied to analyze the moderating variable Gender. According to Baron and Kenny (1986), the moderator variable acts as a factor that changes the strength/weakness of the independent variable on the dependent variable, or in other words, adjusts the strength of the relationship between two variables.

4. RESULTS AND DISCUSSION

4.1. Results

4.1.1. Descriptive statistics analysis

a) Genders

GEND					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	1	107	51,2	51,2	51,2
	2	102	48,8	48,8	100,0
	Total	209	100,0	100,0	

Table 4.1. Descriptive statistics of variable: gender

Source: Author's analysis on SPSS

Based on the numbers given from the survey, in terms of gender, the proportions of men and women were 51.2% and 48.8% respectively, a fairly balanced ratio.

b) Descriptive statistics of scale

Table 4.2. Descriptive statistics of scale

Descriptive Statistics									
	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Kurtosis	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Std. Error

Source: Author's analysis on SPSS

Regarding the scale of dependent variables, the dependent variable EI had a mean value of 3.43, indicating that many participants had the intention to become an entrepreneur in the future.

Regarding the scale of the independent variables, there were numerous independent variables, all of which had an average value of at least 3.4 and above. It meant that the majority of respondents had a lot of favorable opinions about the elements. Statistical results showed that the variable FAM2 had the highest mean value (3.84), showing that many participants agreed that their family maintained good relationships with those around them. The second variable that had the highest mean value was FAM5 (3.79), indicating that a large number of participants agreed with the view that their families had been maintaining positive

values, traditions, and habits for many generations. There were, however, a few elements below level 3, two of which were connected to university entrepreneurship education, EDU1 (2.55) and EDU2 (2.34). This indicated that the majority of respondents disagreed with the claim that universities had provided them with the knowledge and skills they required to become successful entrepreneurs.

4.1.2. Cronbach's Alpha analysis

a) For the independent variables' scales

Table 4.3. Cronbach's Alpha results of individual entrepreneurial orientation (IEO)

IOE elements (6 items): Cronbach's Alpha = 0.944				
Observable variables	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item - Total Correlation	Cronbach's Alpha if Item Deleted
IE01	16.86	27.335	0.858	0.931
IE02	18.85	27.127	0.926	0.926
IE03	16.97	27.696	0.928	0.928
IE04	16.95	31.021	0.787	0.940
IE05	16.82	30.351	0.816	0.936
IE06	17.00	28.418	0.787	0.939

Source: Author's analysis on SPSS

Entrepreneurial education (6 items): Cronbach's Alpha = 0.808				
Observable variables	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item - Total Correlation	Cronbach's Alpha if Item Deleted
EDU1	14.40	14.654	0.447	0.804
EDU2	14.60	11.991	0.454	0.801
EDU3	13.62	11.324	0.628	0.764
EDU4	13.85	11.005	0.692	0.747
EDU5	14.21	11.472	0.563	0.783
EDU6	14.07	11,947	0.661	0.757

Table 4.4. Cronbach's Alpha results of entrepreneurial education (EDU)

Source: Author's analysis on SPSS

Cronbach's alpha coefficients of IEO elements and entrepreneurial education were 0.944, and 0.808 respectively, which were all greater than 0.8, which indicated relatively high internal reliability.

The Corrected item – Total correlation values of the observable variables of the aforementioned independent variables were all greater than 0.3, which proved themselves to have a strong positive correlation with the remaining observed variables in the scale and thus were reliable to be used together to illustrate the parent factor.

Table 4.5. Cronbach's Alpha results of family environment (FAM) - first run

Family environment (5 items): Cronbach's Alpha = 0.662				
Observable variables	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item - Total Correlation	Cronbach's Alpha if Item Deleted
FAM1	13.98	5.937	0.451	0.596
FAM2	13.85	5.928	0.505	0.577
FAM3	14.26	7.144	0.180	0.697
FAM4	14.76	4.269	0.501	0.583
FAM5	13.89	5.806	0.509	0.572

Source: Author's analysis on SPSS

Table 4.6. Cronbach’s Alpha results of family environment (FAM) - second run

Family environment (4 items): Cronbach’s Alpha = 0.697				
Observable variables	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item - Total Correlation	Cronbach’s Alpha if Item Deleted
FAM1	10.55	4.854	0.456	0.650
FAM2	10.42	4.803	0.528	0.616
FAM4	11.33	3.349	0.496	0.664
FAM5	10.47	4.693	0.531	0.611

Source: Author’s analysis on SPSS

In the first run, the Cronbach’s alpha coefficient of family environment was acceptable, but the Corrected item – Total correlation value of FAM3 stood at 0.180 which was much lower than 0.3. This indicated that financial pressure did not have a significant correlation with other remaining observed variables in the factor and was removed from the analysis.

In the second run, the new Cronbach’s Alpha coefficient of FAM was at an acceptable level of 0.697. Furthermore, no other Corrected item – Total correlation values were lower than 0.3. This scale finally had its internal consistency.

For the dependent variable’s scale, there was only one observable variable of this factor, so there was no need to check the internal reliability.

For the moderator’s scale, the author used only one moderator which was gender, so there was no need to check the internal reliability of this specific moderator.

14	,223	1,394	98,030						
15	,181	1,132	99,163						
16	,134	,837	100,000						

Source: Author’s analysis on SPSS

Exploratory Factor Analysis was used to determine the convergence of the factor groups. The principal components method was the extraction method used, along with the Varimax rotation. The author wished to select quality observed variables, the loading factor threshold of 0.45 was used.

In the first run, KMO measure equaling 0.928 (much higher than 0.5) and sig Bartlett’s Test result being 0.000, (lower than 0.05) proved that EFA was appropriate to be used in this research. From Table 4.8, there were three factors extracted with Eigenvalue greater than 1, which met the requirements. And the Total variance explained was 65.763 (greater than 50), which indicated that the extracted factors had explained 65.763% of the data variation of 16 observed variables used in the EFA analysis (FAM3 was already eliminated).

Table 4.9. Rotated Component Matrix - first run

Observable variables	Component		
	1	2	3
IEO1	.853		
IEO2	.845		
IEO3	.860		
IEO4	.776		
IEO5	.779		
IEO6	.842		
FAM1	.469	.477	
FAM2		.659	
FAM4		.649	
FAM5		.842	
EDU1			.784
EDU2			.845
EDU3	.586		
EDU4	.583		
EDU5	.550		.451
EDU6	.523		.456

Source: Author’s analysis on SPSS

As seen in the Rotated Component Matrix, the observable variables were classified into three groups of factors. EDU3 and EDU4 were placed in the same column as other observed variables of IEO elements, indicating a certain correlation. Therefore, the author considered EDU3 and EDU4 as the observed variables of IEO elements.

Also, from Table 4.9, some observed variables were loaded into more than one component:

- FAM1 was loaded into Components 1 and 2 with factor loadings 0.469 and 0.477 respectively.
- EDU5 was loaded into Components 1 and 3 with factor loadings 0.523 and 0.451 respectively.
- EDU6 was loaded into Components 1 and 3 with factor loadings 0.550 and 0.446 respectively.

However, the difference in the loading factors between the two components was less than 0.3 for the three cases above.

Since these observed variables could not explain their factors well, the author decided to remove FAM1, EDU5, and EDU6 and run the EFA analysis again.

Table 4.10. KMO and Bartlett’s Test - second run

Source: Author’s analysis on SPSS

In the second run, KMO measure equaling 0.922 (higher than 0.5) and sig Bartlett’s Test result equaling 0.000 (lower than the 0.05) proved that EFA was still appropriate. From Table 4.12, there were still three factors extracted with Eigenvalue greater than 1, which met the requirements. The extracted factors were able to explain 71.672% of the data variation of 13 observed variables used, which was approximately 5% higher than the previous run.

Based on the Rotated Component Matrix, the observable variables were still classified into three groups of factors, with EDU3 and EDU4 still placed in the same column as other observed variables of IEO elements.

Also, as seen from Table 4.12, there was no more disturbance with any observed variables being loaded into more than one component.

4.1.4. Correlation analysis

Table 4.13. Correlations analysis

		Correlations				
		GEND	EI	IEO	FAM	EDU
GEND	Pearson Correlation	1	-.154*	-.122	-.140*	-.010
	Sig. (2-tailed)		.026	.078	.043	.888

*. Correlation is significant at the 0.05 level (2-tailed).
**. Correlation is significant at the 0.01 level (2-tailed).

Source: Author's analysis on SPSS

a) Relationship between dependent variable (EI) and other independent variables:

As seen from table 1, EI had a linear relationship with all of the independent variables (IEO, FAM, and EDU) with sig < 0.05. Among those independent variables, dependent variables EI had a strong positive relationship with IEO and FAM with Pearson correlation value = 0.853 and 0.550 respectively.

b) Relationship between independent variables:

EDU had a linear relationship with FAM with sig < 0.05. However, the Pearson correlation was not higher than 0.7. Therefore, there was no collinearity between EDU and FAM. EDU and IEO also had a linear relationship with each other due to sig < 0.05. However, r > 0.7. It meant that there was no collinearity happening between them.

4.1.5. Regression analysis

a) ANOVA table

The Analysis of Variance (ANOVA) table measured the goodness of fit (how well the data fits the regression model). F-test was used for this method. The author set up the null hypothesis H0: R²=0 statistically significant. If sig < 0.05, reject H0, R² ≠ 0 statistically significant. If sig > 0.05, accept H0, R² = 0 statistically significant.

Table 4.14. ANOVA

ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	213.240	3	71.080	191.718	.000 ^b
	Residual	76.004	205	.371		
	Total	289.244	208			

a. Dependent Variable: EI

b. Predictors: (Constant), EDU, FAM, IEO

Source: Author's analysis on SPSS

The ANOVA table showed that $\text{sig} = 0.000 < 0.05$, which means $R^2=0$ statistically significant. Therefore, the regression model fit the data set.

b) Model Summary table

The author used another method to measure the goodness of fit of the regression model called the coefficient of determination (R square). When most of the data points are centered close to the regression line, the R^2 value will be high, conversely, if the data points are scattered far away from the regression line, R^2 will be low. The R^2 index is in the Model Summary table.

R^2 and adjusted R^2 both fluctuate within the range from 0 to 1. The closer R^2 is to 1, the more the independent variables explain for the dependent variable, conversely, the closer R^2 is to 0, the less the independent variables establish the explanation for the dependent variable. There is no standard for exactly how much R^2 is required for the model to qualify. The author defines 0.5 as the middle value. If $R^2 < 0.5$, the model does not fit the data; whereas $R^2 > 0.5$ means the regression model fits the data.

Table 4.15. Model Summary

Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.859 ^a	.737	.733	.609	1.888

a. Predictors: (Constant), EDU, FAM, IEO

b. Dependent Variable: EI

Source: Author's analysis on SPSS

Results showed that $R^2 = 0.859$ and adjusted $R^2 = 0.733$. The adjusted R-squared value of 0.766 meant that the independent variables included in the regression analysis affect 73.3% of the variation of the dependent variable, the remaining 26.7% were due to other variables outside the model and random errors.

The table also detected the Durbin–Watson value of 1.888, which determined the autocorrelation in the data. The value recorded was in the range of 1.5 and 2.5, meaning there was no first-order autocorrelation.

c) Coefficient table

T-test (student) is used to determine whether the regression coefficient of each independent variable is significant in the model with the hypothesis H_0 : regression coefficient of independent variable equals 0. If $\text{sig} < 0.05$: reject H_0 , the regression coefficient of the independent variable is statistically different from zero, and has an impact on the dependent variable. If $\text{sig} > 0.05$: accept H_0 , that is, the regression coefficient of the independent variable is zero statistically significant, the variable X_i has no impact on the dependent variable.

Table 4.16. Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-.472	.249		-1.897	.059		
	IEO	.923	.056	.778	16.484	.000	.575	1.739
	FAM	.120	.072	.075	1.674	.096	.643	1.555
	EDU	.163	.073	.086	2.226	.027	.868	1.152

a. Dependent Variable: EI

Source: Author's analysis on SPSS

VIF (variance magnification factor) is an indicator of collinearity in a regression model. The smaller the VIF, the less likely there is to be multicollinearity. According to Nguyen Dinh Tho (2012), a VIF > 2 can be a sign of multicollinearity, causing biased regression estimates. However, there are no adjustments to be made to this table because no variable exceeds the standard value.

The independent variables that satisfied the requirement of sig < 0.05, meaning these independent variables are statistically different from zero are IEO and EDU. The author presents the standardized and unstandardized regression equations in the following order:

$$EI = 0.778*IEO + 0.086*EDU + \varepsilon$$

$$EI = 0.923*IEO + 0.163*EDU + \varepsilon$$

4.1.6. Moderating variable analysis

The author suggests an hypothesis that moderating variable Gender (GEND) has an impact on the relationship of independent variables (IEO, FAM, EDU) and dependent variables (EI). Macro process is used to analyze this moderating variable, with X representing a mean value of the independent variables, and Int_1 representing the product of independent variables and moderating variables.

Table 4.17. Macro process analysis of moderating variables Gender (GEND)

The result from the process shows that gender has no impact on the relationship between the independent variables and dependent variables, as p-value of Int_1 equals 0.4714 < 0.05. In conclusion, the two factors affecting entrepreneurial intention are IEO elements and education, no other factors suggested have an influence on the entrepreneurial intention.

4.2. Discussion

4.2.1. Discussion of the research

From the execution of the survey and the data analysis above, the author has reached the statements as below:

Firstly, the survey has been provided to a significantly distributed audience for a variable and comprehensive sample. Participants of the survey mostly show satisfaction with the general condition of IEO elements, family environment and entrepreneurial education.

Secondly, regarding the survey design, several observed variables are intertwined in more than one component. Because of that, amendments have been made to clear off uncorrelated or corresponding observed variables for better representation of independent variables.

Thirdly, regarding validation of research hypotheses, the author has learned from the analysis results that Individual entrepreneurial orientation has a significant impact on entrepreneurial intention of students (77.8%), followed by Entrepreneurial education (8.6%). Family environment, however, is reported as having no effect on entrepreneurial intention. Therefore, the hypotheses presented at the beginning of the research are concluded as follows:

Table 4.18. Results of research hypothesis validation

Hypothesis	Conclusion
H1: Individual entrepreneurial orientation has a positive relationship to the entrepreneurial intention of the students.	Accept
H2: The family environment has a positive relationship to the entrepreneurial intention of the students.	Decline
H3: Entrepreneurial education has a positive relationship to the entrepreneurial intention of the students.	Accept

Source: Author's synthesis based on research results

Finally, regarding the moderating effect of gender, results from analysis show that gender has no impact on how the factors IEO and Entrepreneurial education influence entrepreneurial intention of the students. There is no specific entrepreneurship linkage to either of the genders, which is different from what was previously perceived by Fagenson and Marcus and their research in 1991. This also goes against what has been stated in research of Hauset et al. (2013) that male exhibit higher levels of entrepreneurial attitudes, and behavior control compared to women. Furthermore, this finding can be one of the supporting points for gender equality as to how entrepreneurship is perceived.

Results from this paper indicate that individual entrepreneurial orientation displays a strong correlation with entrepreneurial intention. The results indicated that the participants agreed with having behaviors of innovativeness, pro-activeness, and risk-taking along with positive entrepreneurial intention. The author understands that the students of Foreign Trade University in Ho Chi Minh City have either or both of the following: Students are packed with adequate skills that complement their entrepreneurial orientation; Students highly assess themselves regarding their quality of innovativeness, risk-taking, and proactiveness. Other findings resulting from the former statement, yet have not been cleared depending on the data collected alone, are about how and where these students acquire the skills needed. Further investigation is required for an explanation of this question. Aside from that, with the result of Entrepreneurial education as an external factor that affects students' entrepreneurial intentions, the author may now assume that students utilize entrepreneurial education and training systems as methods to develop their individual entrepreneurial orientation, thus their entrepreneurial intention.

Entrepreneurial education has a small yet visible impact on entrepreneurial intention. However, EDU1 and EDU2 mean value equals below average level. However, results show that students of Foreign Trade University in Ho Chi Minh city are not satisfied with support from the university itself.

4.2.2. Proposal

As IEO elements positively impact the entrepreneurial intention of the students, it is necessary that Foreign Trade University in Ho Chi Minh City should take action to help students improve their innovativeness, risk-taking abilities and proactiveness, in order to prepare for their entrepreneurship. Firstly, besides theoretical knowledge, entrepreneurial courses offered by the university should create opportunities for students to “learn by doing” and permit students to immerse in real business situations, through entrepreneur incubators or hubs. Secondly, encouraging students to participate in invention and innovation competitions can help them become more innovative in their thinking, proactive in their planning and executing to achieve the best results, and also more ready to take risks if necessary.

Proposals regarding education include intertwining IEO elements into educational activities. The university itself should organize an entrepreneur course under various forms of which topic should focus on the factors that influence the intention to conduct start-up business among students. Moreover, in order to enlarge and diversify the sources to support the educational systems, the university ought to promote different methods to learn strategies from other well-known universities worldwide. These strategies include but are not limited to providing guidance to students when starting new projects and facing hard challenges. Finally, Foreign Trade University should utilize the policy of the Vietnamese government in creating a startup ecosystem, that is to support students with adequate resources in different fields of production, business and services, those that are expanding with significant capital investment.

5. CONCLUSION

Firstly, this paper is based on empirical research and outlines the factors influencing students’ entrepreneurial intention. From which, the research emphasizes the importance of development and entrepreneurship orientation for students.

Secondly, the paper has organized the factors with a suitable theoretical framework in order to achieve reliable results. The author hopes that the findings will serve as a base model for later interpretation on development strategies for entrepreneurship orientation for students, which is still a difficult topic in the organization.

Thirdly, the analysis results provide a more specific view on how much the factors affect the entrepreneurial intention among the students. For instance, Individual entrepreneurial orientation (innovativeness, pro-activeness and risk-taking) has the largest impact on entrepreneurial intention, and Entrepreneurial education also plays a role despite less importance. Thus, the research shows how important IEO elements should be discovered and perceived among the individuals in order to enhance entrepreneurial intention.

Finally, through the results of the research and analyzing process, the author indicates the relationship between entrepreneurial intention and the most important factors. Therefore, the author suggests several strategies to enhance the entrepreneurial thoughts and behavior throughout activities that are related to entrepreneur intended candidates.

6. APPENDIX

Survey

Dear Sir/Madam/Friend,

We are a group of Scientific Research Students of Foreign Trade University, campus II in Ho Chi Minh City. Currently, our group is conducting research on the topic “Factors affecting entrepreneurial intention of students at Foreign Trade University in Ho Chi Minh City”.

In order to have the database for the research, we hope you can spend some of your valuable time to participate in answering this survey, based on your opinion. Your help and support will certainly contribute to the success of this study (Please note that the information you provide will be confidential and used only for the research purpose of this study). The research team would like to express our gratitude by GIFT SET offered to you after you have completed the survey.

If you have any questions or feedback, please contact the research team via this email.

Best regards./.

PART 1: INDIVIDUAL INFORMATION

1. Are you studying at FTU2 at HCMC?

Yes No

2. Which year are you in?

1st year 2nd year 3rd year 4th year

3. What is your biological gender?

Male Female

PART 2: FACTORS AFFECTING ENTREPRENEURIAL INTENTION OF FTU2 STUDENT

Could you please give your opinion on the following statements on different levels as follows:

1. Totally Disagree; 2. Disagree; 3. Normal; 4. Agree; 5. Totally Agree

	1	2	3	4	5
Entrepreneurial Intention					
I always want to start up in the future					
Individual Entrepreneurial Orientation Elements (Proactiveness-Innovativeness-Risk taking)					
I usually make plans for my start-up intention.					
I have high entrepreneurial awareness and entrepreneurship.					
I have a good entrepreneurial orientation.					
I have the spirit of innovation and creativity in business (the ability to create and apply achievements, technical and technological solutions, and management solutions to improve the efficiency of socio-economic development, enhance productivity, quality, and added value of products, goods,...).					
I am proactive in business (flexible in finding, identifying, and optimizing business opportunities,...).					
I have a risk-taking spirit in business (taking high risks such as competition, fraud, bankruptcy, etc.).					
Family environment					
My family has an effective method of educating children about independence.					
My family maintains a good relationship with the people around (gentle attitude, mutual respect,...).					
My family is not under the pressure of resources (financial, facilities, healthcare, education,...).					
Education					
My family has a tradition of starting a business (parents and relatives are successful entrepreneurs).					
My family has always maintained good values, customs, and practices for generations.					
I received a thorough education in the knowledge needed to start a business from the school (through courses, extracurriculars, seminars ...).					

I received thorough training in the skills needed to start a business from the school (through courses, extracurricular sessions, seminars,...).					
I participate in many and varied extracurricular activities that help me accumulate knowledge and entrepreneurial skills in organizations inside and outside the school.					
I often participate in competitions related to startups.					
I participate in many and varied courses outside of school to accumulate knowledge and entrepreneurial skills.					
I have a lot of knowledge about the actual business environment.					

Once again, our research team would like to thank you for taking the time to participate in the survey.

We sincerely wish you a good day, with effective study and work.

CORPORATE SOCIAL RESPONSIBILITY ON CUSTOMER BEHAVIOUR OF UNIVERSITY STUDENTS IN THE COSMETICS INDUSTRY: THE MEDIATING ROLE OF CORPORATE IMAGE, CUSTOMER SATISFACTION AND CUSTOMER LOYALTY.

**Author: Le Phu Thien¹, Bui Tran Quoc Dat², Nguyen Ngoc Dong Nghi²,
Ngo Quoc Vinh², Do Thi Mai Hoa²
Mentor: Pham Thi Chau Quyen²**

ABSTRACT: *This research investigated the impact of CSR on the cosmetics industry and explores the connection between CSR and customer behavior among undergraduate students. The study also examines whether CSR is considered a critical marketing strategy for sustainable development. The study specifically looked at the cosmetics industry and collected 358 valid questionnaires from consumers. These questionnaires were then analyzed using Partial Least Squares Structural Equation Modeling. Additionally, the study finds that CSR has a positive effect on corporate image, customer loyalty, purchase intention, and price premium by using these variables as mediating factors. Furthermore, CSR can influence customer behavior through improving corporate image, customer satisfaction and customer loyalty. These results may benefit future studies and useful applications concerning CSR and consumer behavior.*

Keywords: corporate social responsibility; Partial Least Squares Structural Equation Modeling; cosmetics industry; corporate image; customer loyalty; customer satisfaction; purchase intention; price premium.

1. INTRODUCTION

Corporate Social Responsibility (CSR) is a vital aspect of contemporary business practices, providing a framework for businesses to pursue their economic goals while also fulfilling their social responsibilities. This viewpoint is supported by numerous scholarly sources, such as Carroll's CSR Pyramid, which outlines the key areas of responsibility that businesses must address to achieve sustainable success. Additionally, research by KPMG has found that consumers are increasingly prioritizing companies with strong CSR practices.

Corporate Social Responsibility (CSR) has become an important issue in the context of climate change, which has had direct impacts on human life, socio-economic development, and the environment. 87% of the largest companies worldwide have issued CSR reports, and recent focus on climate change has contributed to the growing interest in CSR. The cosmetic market in Vietnam is an emerging market with potential for growth, with an average spending level of 4 USD/person/month. Vietnamese cosmetic companies only account for 10% of the market share, with 90% controlled by foreign firms. CSR initiatives can also help build a better brand image, leading to increased customer satisfaction and loyalty. Businesses should consider the impact of their operations on the environment and society, and take steps towards responsible and sustainable practices.

This study aims to fill the research gap by examining the impacts of Corporate Social Responsibility (CSR) on undergraduate students' consumer behavior in the cosmetics industry. It will consider the mediating effect of corporate image, customer satisfaction, and customer loyalty, which is represented by two components: price premium and purchase intention. It will also consider the mediating effect of corporate image, customer satisfaction, and customer loyalty. The latter is represented by two components: price premium and purchase intention.

¹ Foreign Trade University Campus Ho Chi Minh City; Email: lephuthien2012255565@ftu.edu.vn

² Foreign Trade University Campus Ho Chi Minh City.

First, a literature review will be conducted on CSR, university students’ customer behavior, corporate image, customer satisfaction, and customer loyalty. The study will then examine the effects of CSR on university students’ customer behavior in the cosmetics industry, as well as the mediating effects of corporate image, customer satisfaction, and customer loyalty on these factors.

Second, based on the findings, this study will recommend measures that stakeholders can take to better understand university students’ customer behavior in the cosmetics industry, leading to improvements in corporate performance.

The target population (respondents) for this study is college students residing in HCM City, ranging from their first to sixth years of study, depending on their field of study. Given their heightened awareness of the prevailing environmental conditions and their health, particularly with regards to cosmetic and skincare products, university students are expected to play a key role in the expansion and diversification of the cosmetics industry, making them a potential source of human capital.

2. THEORETICAL FRAMEWORK

2.1. Literature review

2.1.1. Corporate social responsibility (CSR)

CSR seeks to help businesses meet a variety of goals, including maximizing profits and shareholder value, satisfying social expectations, meeting the needs of various stakeholders, including employees, customers, suppliers, and communities, adhering to the law, and voluntarily taking on social responsibility (Carroll, 1979; Smith, 2003; Stubbs & Cocklin, 2007). Carroll first introduced the CSR Pyramid concept in 1991, and it has been frequently used in earlier studies (Galbreath & Shum, 2012; He & Lai, 2012; Ramasamy & Yeung, 2009; Xiao, Heo, & Lee, 2017). Here is a further explanation of these four CSR ideas:

Figure 2.1 Carroll's Pyramid of Corporate Social Responsibility

Source: Schwartz and Carroll, 2003

(1) Economic responsibility: A responsibility to produce the goods or services that a society requires, to deliver them at prices that are socially acceptable, to make profits using the proper methods to maintain corporate growth and profitability, to create jobs, and to protect the interests of stakeholders.

(2) Legal responsibility: The obligation to conduct business in accordance with all relevant labor laws, environmental regulations, consumer protection laws, and tax laws.

(3) Ethical responsibility: A voluntary, internal duty to uphold moral principles, or, in other words, to act in a way that is just, fair, and right while protecting stakeholders. This obligation is not legally bindable.

(4) Philanthropic responsibility, also known as “voluntary responsibility” in early research (Carroll, 1979), refers to the obligation to voluntarily and unconditionally advance the wellbeing of others, engage in charitable endeavors, make donations, and uphold civic duties.

CSR is increasingly seen as a corporate duty, a kind of corporate citizenship, and a strategic embodiment of corporate proactiveness. Research has shifted away from the relationships between CSR and financial performance and towards those between CSR and corporate reputation, corporate image, and consumers. CSR significantly affects a company's financial results and its efforts to build a solid reputation or image in a crowded market.

2.1.2. Customer behavior

The stakeholder theory, put forth by Freeman in 1984, states that customers are a company's main stakeholders and are essential to its growth and profitability. Previous research has demonstrated the importance of purchase intentions and price premiums, both of which are indicators of customer behavior, for a company's performance and profitability. Purchase intentions are crucial indications that precede actual buying activity, and the amount that a consumer is willing to pay over the market price of a product, the gap between the selling price and the product's perceived worth, and the percentage by which a product's selling price exceeds its market price are all examples of price premiums. Companies that sell products at larger price premiums produce more cash flow and are more sensitive to consumer price changes than their competitors (Aaker & Keller, 1990; Klein & Leffler, 1981).

2.1.3. Corporate image

An individual's sentiments, impressions, trust, experiences, thoughts, and beliefs about an object are combined to form their image of the object (Aaker, 1996; Kotler, 2003). Corporate image is the term used to describe how customers feel about a company as a whole and whether they have a positive or negative opinion of it based on how well the organization performs, produces, or provides services (Aaker, 1996; Nandan, 2005; Walters, 1978).

Depending on the study or application topic, many methods of corporate image assessment are used (Nguyen & Leblanc, 2001). A vital intangible corporate asset that requires ongoing upkeep is corporate image (Aaker, 1996; Kotler, 2003). A strong brand's reputation attracts capital, fosters consumer trust, lowers uncertainty, increases customer loyalty and buy intent, and boosts profits and sales (Bataineh, 2015; Cretu & Brodie, 2007; Martinez & Pina, 2005; Ryu, Lee, & Kim, 2012). Also, customers are more inclined to buy goods or services from a company with a positive corporate image than from one with a shady or poor reputation (Liou & Chuang, 2008; Nguyen & Leblanc, 2001).

2.1.4. Customer satisfaction

Consumer satisfaction is of utmost importance in business management, as it leads to increased customer trust, repurchase intention, profitability, and competition (Ranaweera & Prabhu, 2003). It is the degree of pleasure or dissatisfaction that an individual experiences as a result of comparing their actual experiences with the product or service to their initial expectations (Kotler, 2003; Oliver, 1997). Oliver (1980) proposed the expectation disconfirmation hypothesis, which has been frequently applied to research consumer satisfaction. According to the theory, customer satisfaction results from contrasting the product's or service's actual performance with the user's initial expectations. Positive disconfirmation took place when the performance felt to have exceeded these expectations, leading to great satisfaction. expectations, negative disconfirmation happens when the perceived performance does not meet these expectations, resulting in poor satisfaction. When perceived performance meets initial expectations, neither positive disconfirmation nor negative disconfirmation takes place, and satisfaction levels stay the same. Businesses should value such client input in their attempts to raise customer happiness and loyalty.

2.1.5. Customer loyalty

Customer loyalty is defined as a lasting relationship between individual attitudes and repurchases, representing the rate, coordination, and likelihood of an acquisition with the same supplier Dick & Basu (1994). The research on customer loyalty has many different approaches: the behavioral approach of Seiders & Associates (2005) and the attitude and perspective of Jacoby & Chesnut (1978). Behavioral loyalty is often expressed in a behavioral approach based on future repurchase behavior, the number and frequency of repurchases, and the change in brand per time according to Bandyopadhyay and Martel (2007); Liang et al. (2009). Attitudinal loyalty is an attitudinal approach, which emphasizes the role of experience and affective aspects in customer loyalty and reflects customer actions; related past purchase limits of customers to a particular brand or a group of brands that are likely to purchase in the future based on past purchasing behavior Evanschitzky et al. (2006).

2.2. Related theories and research models

2.2.1. The Stakeholder theory

The word “stakeholder” first appeared in an internal memorandum at the Stanford Research Institute (now SRI International, Inc.) in 1963. It was meant to challenge the notion that stockholders are the only group to whom management needs to be responsive. Early research in the area of stakeholder management defines a stakeholder as any group or individual who can affect or is affected by the achievement of the organization’s objectives (Freeman, 1984). Primary stakeholder groups consist of shareholders and investors, employees, customers, suppliers, public entities, and trade associations and environmental groups (Clarkson, 1995). Secondary stakeholders include those who are not directly engaged in the organization’s economic activities but are able to exert influence or are affected by the organization (Savage, Nix, Whitehead and Blair, 1991)

Stakeholder theory suggests that firms are motivated to broaden their objectives to include other goals in addition to profit maximization. Companies embrace a CSR program as a way to promote socially responsible actions and policies and to effectively respond to stakeholder demands (Maignan & Ferrell, 2004)

2.2.2. The Social Identity theory

Positive social identity formation is enhanced when individuals differentiate their in-group from out-groups in a favorable way. This satisfies basic human needs like self-esteem and certainty. Creating positive group distinctiveness helps individuals define their position in society, giving them a sense of belonging and guidance in their behavior. Research by Abrams and Hogg (1988) and Scheepers et al. (2006) highlights the importance of positive group distinctiveness in shaping social identities.

Social identity theory has been applied in the domain of consumer behavior to examine the effects of individuals’ social identities and group memberships on their attitudes, behaviors, and purchasing decisions. Scholars have investigated the role of social identity in diverse areas such as brand loyalty, brand communities, social influence, and consumer activism. The theory has proven to be a valuable framework that illuminates the cognitive, motivational, and social processes that shape individuals’ behavior and decision-making across different contexts (Ellemers, Kortekaas, & Ouwerkerk, 1999).

2.2.3. CBBE model (Keller’s Brand Equity Model)

Keller (1993) proposed that consumer-based brand equity at the individual level originates from brand knowledge, which is characterized as an associative network composed of nodes of associations.

In 2003, Keller extended this definition, defining brand equity as the variation in customer response to marketing activity. The fundamental concept behind brand equity is to influence customers’ cognitive,

emotional, and perceptual responses to a product or service based on positive experiences. To accomplish this, a company should strive to create a favorable environment that fosters positive brand thoughts, feelings, and perceptions among customers. Keller's model outlines six dimensions that contribute to consumer-based brand equity, which include brand salience, brand performance, brand imagery, brand feelings, brand judgments, and brand relationships. By prioritizing these factors, companies can cultivate a robust brand equity that can foster customer loyalty, trust, and positive word-of-mouth marketing.

3. PROPOSED FRAMEWORK AND HYPOTHESIS DEVELOPMENT

This research examines how CSR affects customer behavior intentions from the standpoint of the consumer. Based on the reviewed literature and related theories and models, the conceptual framework of the CSR drivers, consumer behavior related to company image, customer satisfaction, and customer loyalty are displayed in Figure 4.1 below. We will create the research model used in our paper in the parts that follow, based on the findings of previous studies.

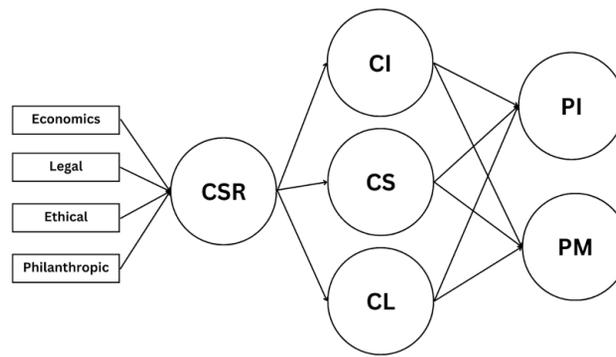

Figure 4.1 Conceptual model

Source: Conducted by authors, 2023

3.1. Impact of CSR on customer behavior

Research has shown that customers consider CSR when making purchase decisions and are willing to pay a premium for products or services offered by socially responsible firms (Creyer & Ross, 1997). The perceived value of a company's offerings can be enhanced when the business not only sells CSR products but also takes actions to promote social well-being and environmental protection, resulting in increased support for the company's CSR efforts and improved purchase intentions (Luo & Bhattacharya, 2006; Wu et al., 2016).

Several empirical studies (Devinney, 2009; Homburg et al., 2005; Mohr & Webb, 2005; Wang & Chen, 2016; Yuen et al., 2016) have confirmed that CSR positively influences customer purchase intentions and evaluation of companies. Customers prefer products or services offered by socially responsible firms and are willing to pay higher prices for them, particularly when given a choice between similar products of the same price.

H1a. The relationship between CSR and purchase intention is positive.

H1b. The relationship between CSR and price premium is positive.

3.2. Impact of CSR on corporate image, customer satisfaction, and customer loyalty

Dichter's (1985) research found that consumers' initial perceptions of product or service quality and external company activities are the key components of a corporate image. CSR serves as an essential

piece of external information about a company, raising its profile in the market and shaping its corporate image, while simultaneously enhancing consumer attitudes. Engaging in CSR activities has been shown to generate intangible benefits such as enhancing customer satisfaction and projecting a positive corporate image (Basdeo, Smith, Grimm, Rindova, & Derfus, 2006; Ellen, Mohr, & Webb, 2000). Enterprises also strive to encourage customer loyalty, which is considered a fundamental behavior. Servera Francés and Piqueras Tomás (2019) found that CSR positively impacts customer loyalty through the perceived value of customers. Zhang (2019) also discovered that charitable responsibility and customer responsibility have a positive effect on customer loyalty. In the cosmetics industry, Osakwe and Yusuf (2021) concluded that CSR has a positive impact on customer loyalty with reputation and trust serving as intermediary variables.

H2a. The relationship between CSR and corporate image is positive.

H2b. The relationship between CSR and customer satisfaction is positive.

H2c. The relationship between CSR and customer loyalty is positive.

3.3. Impact of corporate image, customer satisfaction, and customer loyalty on customer behavior

Kevork and Vrechopoulos (2009) have found that customer identification and emotional support are critical for businesses seeking to boost customer behavioral intentions. Prior studies (Cretu & Brodie, 2007; Ryu et al., 2012) have emphasized the importance of developing a strong corporate image and attaining high levels of customer satisfaction to achieve this goal. Social identity theory suggests that customers tend to establish relationships with companies with solid reputations and high levels of customer satisfaction, leading to increased purchase intentions, willingness to pay higher prices, positive word-of-mouth, and a greater sense of uniqueness and self-worth (Bhattacharya & Sen, 2003; Keh & Xie, 2009; Matute-Vallejo et al., 2011). A strong corporate image can also help differentiate a company from its rivals, reducing consumer uncertainty, while high levels of customer satisfaction can increase consumer confidence and positive attitudes towards a company (Bataineh, 2015; He & Lai, 2012; Luo & Bhattacharya, 2006; Martinez & Pina, 2005). Consumer loyalty to a brand can mitigate the impact of price on buying behavior, as consumers are often willing to pay more for their preferred brand (Evans, Moutinho, & Raaij, 1996). These findings suggest that developing a strong corporate image and high levels of customer satisfaction are crucial for businesses seeking to enhance customer behavior and their customer relations strategies, thereby achieving a competitive advantage in the market (Kevork & Vrechopoulos, 2009).

H3a. The relationship between corporate image and customer purchase intention is positive.

H3b. The relationship between corporate image and price premium is positive.

H3c. The relationship between customer satisfaction and customer purchase intention is positive.

H3d. The relationship between customer satisfaction and price premium is positive.

H3e. The relationship between customer loyalty and customer purchase intention is positive.

H3f. The relationship between customer loyalty and price premium is positive.

3.4. The mediating roles of corporate image, customer satisfaction, and customer loyalty in the relationship of CSR and customer behavior

This study proposes that corporate image and customer satisfaction mediate the relationship between corporate social responsibility (CSR) and customer behavior. Social exchange theory suggests that individuals maintain reciprocal relationships with groups, providing intrinsic or extrinsic benefits in exchange for benefits received (Blau, 1964). CSR initiatives can promote national economic growth or social well-being, leading consumers to identify with the firm and perceive high value in its products or services.

Previous studies suggest that consumers tend to favor companies that demonstrate social responsibility and philanthropy, and CSR participation can enhance corporate image, strengthen consumer identification, improve competitiveness, and increase purchase intention and loyalty (Carroll & Shabana, 2010; He & Lai, 2012; Porter & Kramer, 2006; Wu et al., 2016).

H4a. The influence of CSR on customer purchase intention is mediated by corporate image.

H4b. The influence of CSR on price premium is mediated by corporate image.

H4c. The influence of CSR on customer purchase intention is mediated by customer satisfaction.

H4d. The influence of CSR on price premium is mediated by customer satisfaction.

H4e. The influence of CSR on customer purchase intention is mediated by customer loyalty.

H4f. The influence of CSR on price premium is mediated by customer loyalty.

4. RESEARCH METHOD:

4.1. Instruments:

4.1.1. Demographic questions:

In addition to their phone number or email address, which will be used to distribute materials later, respondents were asked to answer six questions about their basic demographic information. This allowed the author to categorize and confirm that the obtained samples accurately represented Ho Chi Minh City's demographic makeup.

4.1.2. Official measurement scale:

This study chose Cocoon as the representative company for the questionnaire. Cocoon is a well-established and reputable cosmetic company in Vietnam, with a significant presence in the industry due to its brand recognition, market share, and customer base. The results of the study can be applied across the industry, as Cocoon's CSR initiatives and their impact on customer behavior are representative of other cosmetic companies in Vietnam. The questionnaire was amended once the pilot research and pretest were finished, and a final version was produced. The questionnaire used a 7-point Likert scale to assess respondents' opinions toward CSR in the economic, legal, ethical, and philanthropic dimensions, as well as corporate image, customer satisfaction, customer loyalty, and customer behavior represented by price premium and purchase intention.

4.2. Procedure:

4.2.1. Data collection:

This study employed convenience sampling, a non-probability sampling technique that includes members of the target population who meet particular practical criteria (Etikan et al., 2016). Eligible individuals were sent a study survey online through social media and email. The bulk of entries were approved, with the exception of people who don't reside in HCM City. Out of the 404 responses received, 358 were legitimate, providing data for statistical analysis.

4.2.2. Participants:

The author gathered 404 observations after distributing questionnaire questionnaires via email and social media. 358 Ho Chi Minh City university students made up the final sample, representing 28 of the 39 universities in HCMC. The survey's greatest participation percentage was at the Foreign Trade University in Ho Chi Minh City, with 22.35% of the student body participating. UEH and Open University accounted for

19.27% of the poll respondents, with 32.96% of all respondents being sophomores and students in their third year having the second-highest participation rate (25.42%). This is due to the corporate social responsibility (CSR) of cosmetics companies, which give attention to health, society, and environmental sustainability.

4.2.3. Data analysis:

Descriptive statistics were used to describe the sample characteristics and identify any out-of-the-ordinary values in the samples. To evaluate the research model (PLS-SEM), a structural equation model with variance-based assumptions was used. Stata 16.0 and SmartPLS 4.0 were used to analyze the data in two stages. In the first stage, repeated observed variable procedures were used to determine the LOC score. In the second stage, LOC scores were saved as LOC variables in the data.

A new model was created in the second step using variables that have LOC weights. Finally, the common method bias and multicollinearity of the gathered data were evaluated using SmartPLS. The measurement assessment involves internal consistency, convergent validity, and discriminant validity. Cronbach’s alpha is used to evaluate internal consistency, while item loadings, average variance extracted (AVE), and composite reliability (CR) are all parts of the convergent validity. Items are deemed genuine if their loadings are equal to or greater than 0.5.

The structural model assessment and hypothesis testing is carried out using the bootstrapping technique of 5000 re-sampling. The initial phase involves testing for path-relationships utilizing coefficient, t, and p values. The predictive power (R-squared value) is presented, and a blindfolding test is performed to assess the predictive relevance (Q-squared) of the model. When Q-squared value is greater than zero, the PLS path model has predictive importance for that construct.

5. RESULT AND DISCUSSION:

5.1. Measurement model

First, we use the repeated observed variable technique. In this step, we do two things: (1) Assess the reflective measurement model for the LOCs and (2) Add the weighted data of the LOCs to serve the next step.

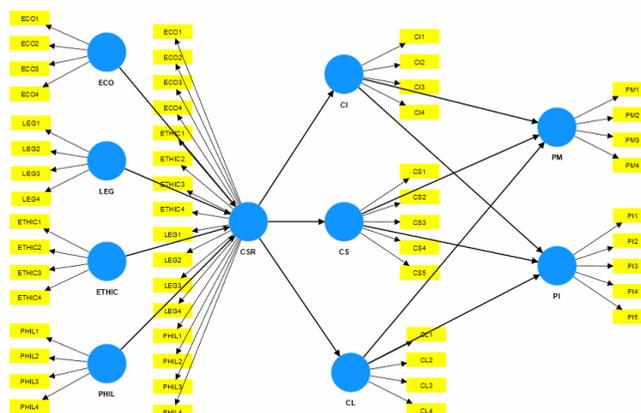

Figure 6.1 Stage 1 of the measurement model.

Source: Conducted by authors, 2023

The study used Cronbach’s Alpha and Composite Reliability (CR) to assess the scale’s dependability, and the AVE index to assess consistency. The results showed that the model was reliable and consistent, with high individual and aggregate reliability and Cronbach’s Alpha values exceeding the minimum threshold of 0.7 established by Nunnally and Bernstein (1994).

The Fornell-Larcker and HTMT Analysis shows that the square root of average variance extracted in the diagonal elements is greater than the off-diagonal elements, which represent correlations between constructs. This indicates that the latent constructs in the pattern are discriminant valid, as noted by Barclay et al. (1995). The results confirm the measurement model’s validity of the authors’ model.

5.2. Structural model

The examination of the PLS-SEM structural model came next after the measurement model was evaluated. A new diagram shows the LOC variables obtained from the factor weights.

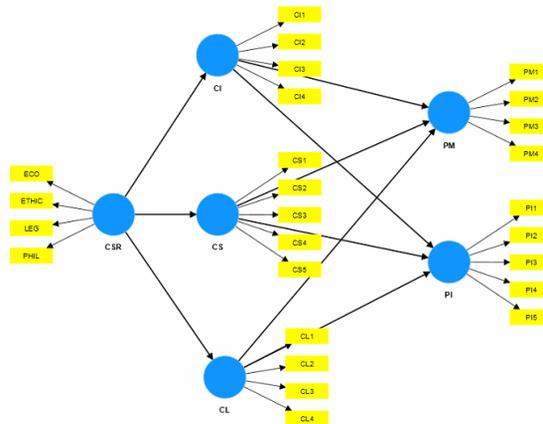

Figure 6.2 Stage 2 of the measurement model.

Source: Conducted by authors, 2023

A comprehensive assessment approach was used to check for common method bias in this study, and Kock’s (2015) findings confirmed that it did not pose a significant risk to the study’s validity. Multicollinearity was not a problem for the study, as indicated by the inner VIF values for each component, which were all below the 3.33 threshold value (Kock & Lynn, 2012).

5.3. Hypothesis testing result

The relationship between corporate social responsibility (CSR), price premium (PM), and price image (PI) is shown to be direct and in favor. The PLS path model has predictive validity for this concept when Q-squared value is greater than zero. Both the price image and the students’ price premium had excellent R-squared results, meaning the model’s predictions regarding the price premium and purchase intention of students can explain 27,7% and 23,9% of the variance, respectively. Random error and variables outside of the model account for the remaining 48.9%.

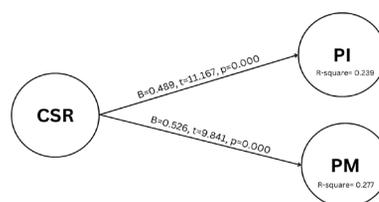

Figure 6.3 Relationship between corporate social responsibility and price premium and price image

Source: Conducted by authors, 2023

The path coefficients obtained from the bootstrap analysis were used to evaluate impact relationships, and the results are displayed in Table 6.6. The results indicated that Corporate Social Responsibility has

a significantly positive relationship with corporate image ($\beta=0.632$, $t=14.361$, $p<0.001$), customer loyalty ($\beta=0.557$, $t=13.985$, $p<0.001$) and customer satisfaction ($\beta=0.617$, $t=15.495$, $p<0.001$). The results also identify that corporate image has a considerably positive relationship with price premium ($\beta=0.247$, $t=3.217$, $p<0.005$), and so does customer loyalty ($\beta=0.196$, $t=2.375$, $p<0.02$) and customer satisfaction ($\beta=0.200$, $t=2.401$, $p<0.02$). Besides, the result showed that both corporate image ($\beta=0.144$, $t=2.342$, $p<0.02$) and customer loyalty ($\beta=0.578$, $t=10.145$, $p<0.001$) have a positive relationship with purchase intention. The results in the table show that there is no significant correlation between CS and PI ($\beta=0.087$, $t=1.270$, $p>0.2$). Therefore, the positive effects between CSR and dependent variables (PI, PM) are all statistically significant.

Hypotheses 2a, 2b and 2c claimed that corporate social responsibility would have a favorable impact on business image, customer satisfaction, and consumer loyalty. Similarly, the hypotheses from 3a to 3f suggested that these three factors would lead to positive outcomes in terms of consumer behavior, as reflected by purchase intention and price premium. As a result, all of the hypotheses in sections 2 and 3 are supported except for 3c, which was found to be insignificant based on the statistical analysis and thus rejected.

Moreover, the specific indirect effects among the variables were also tested. Preacher, Rucker, and Hayes' (2007) strategy emphasizes the importance of the indirect effect to create a mediating connection. All distinct indirect effects had p-values less than 0.05, suggesting that Corporate Image, Customer Satisfaction, and Customer Loyalty mediate the relationship between CSR and Purchase Intention and Price Premium. The indirect effect of CSR on Purchasing Intention through Customer Loyalty had the highest regression coefficient of 0.322, while the indirect effect of CSR on Price Premium had the lowest regression coefficient of 0.109. Furthermore, the indirect effect of CSR on Price Premium, with the mediating role of Customer Loyalty, had the lowest regression coefficient of 0.109

Hypotheses 4a, 4b, 4e, 4f, and 4d were developed to explore the mediating effect of corporate image, customer satisfaction, and customer loyalty on the relationship between CSR and customer purchase intention and price premium. The results showed that companies with higher levels of corporate social responsibility tend to have better corporate image, customer satisfaction, and customer loyalty, leading to increased purchase intention and willingness to pay a premium price. Hypothesis 4c, which posited that customer satisfaction would mediate the relationship between CSR and customer purchase intention, was rejected.

Table 6.8 Testing results

Hypothesis	Content	Result
H1a	The relationship between CSR and customer purchase intention is positive.	Supported

5.4. Discussion

This research investigated the impact of corporate social responsibility (CSR) on customer behavior, specifically purchase intention and price premium, in the cosmetics industry in Vietnam. The study was conducted among university students in Ho Chi Minh City, using a sample size of 358 respondents. The findings revealed that CSR has a positive impact on both price premium and purchase intention, with the impact being influenced by corporate image and customer loyalty. Customer satisfaction only affects price premium, not purchase intention. Therefore, should there be a positive change in either CSR or customer behavior, it would result in a similar pattern of increase in price premium, while purchase intention would remain unchanged. Overall, this study contributes to the understanding of how CSR impacts customer behavior in the cosmetics industry in Vietnam, and further research could explore the impact of CSR on other industries and in different regions.

6. CONCLUSION

From the perspective of the consumer, this study examines how CSR affects consumer behavior. On the basis of the mediating elements, we analyze the mechanism determining the impact of CSR on consumer behavior based on the social identity and social exchange theories and our prior research (including corporate image and customer loyalty). According to our research, CSR best practices can increase consumer support for businesses by helping to create a favorable perception of those businesses, which in turn improves customer purchase intention and price premium. CSR can therefore be a valuable and promising marketing tactic to improve customers' satisfaction, favorable opinions of businesses, and purchasing patterns. This can help businesses establish distinctive traits and good perceptions that could result in significant financial gain.

This study identified three key managerial implications for cosmetics firms in Vietnam: participating in corporate social responsibility initiatives, effectively disseminating information about their CSR activities, and offering products and services at reasonable prices. To enhance customer-perceived value, firms should customize products, develop products from environmentally friendly or recyclable materials, establish feedback mechanisms, and support charity organizations or community services. Compliance with legal requirements, along with a focus on customer satisfaction and perceived value, should be integral considerations for cosmetics firms to effectively leverage CSR activities and achieve desired outcomes.

7. APPENDIX:

Appendix 1. Official Measurement Scale

FACTORS	OBSERVED ITEMS	SOURCES	CODE
Dependent Factor	Purchase Intention:	Richard, J.E., & Zhang, A. (2012)	PI
	1. I will continue to buy products from this firm in the next few years.		PI1
	2. I will encourage friends and relatives to purchase products from this firm.		PI2
	3. I consider this firm to be my first choice among other competitors.		PI3
	4. I will say positive things about this firm to other people.		PI4
	5. I will recommend this firm to someone who asks for my advice on cosmetics products.		PI5
	Price Premium:	Zeithaml et al. (1996)	PM
	1. I am willing to buy products or services of this firm even though they are more expensive due to the CSR.		PM1
	2. I'm willing to buy items with CSR features when given a choice between similar products of the same price.		PM2
	3. I continue to purchase products with this firm even if its prices increase due to CSR.		PM3
	4. I will pay a higher price than its competitors charge for the benefits that this firm currently brings to society.		PM4

<p>Mediating Factors</p>	<p>Corporate Image</p> <ol style="list-style-type: none"> 1. I have always had a good impression of this firm. 2. In my opinion, this firm has a good image in the minds of customers. 3. I believe that this firm has a better image than its competitors. 4. This firm is a leading brand in its immediate industry in my opinion. <p>Customer Satisfaction</p> <ol style="list-style-type: none"> 1. I am satisfied with the products and services of this firm. 2. My experience at this firm has always been very rewarding. 3. I am satisfied with my overall experience with this firm. 4. This firm's products and services meet my expectations. 5. I am happy that I have bought this firm's products. <p>Customer Loyalty</p> <ol style="list-style-type: none"> 1. I consider this firm as my first choice for cosmetics products. 2. I have an intention to continue to buy products from this company. 3. I have an intention to recommend this company as the best in the area. 4. I have an intention to encourage friends and relatives to buy cosmetics products from this company. 	<p>Nguyen and Leblanc (2001)</p> <p>Hanzaee and Sadeghian (2014)</p> <p>Zeithaml et. al (1996)</p>	<p>CI</p> <p>CI1</p> <p>CI2</p> <p>CI3</p> <p>CI4</p> <p>CS</p> <p>CS1</p> <p>CS2</p> <p>CS3</p> <p>CS4</p> <p>CS5</p> <p>CL</p> <p>CL1</p> <p>CL2</p> <p>CL3</p> <p>CL4</p>

INFLUENCE OF REFERENCE GROUP ON ONLINE IMPULSE BUYING BEHAVIOR: A STIMULUS ORGANISM RESPONSE FRAMEWORK

Author : Tran Thi Kim Anh¹, Nguyen Le An², Ngo Kim Anh², Vo Thanh Nam²

Mentor: Le Hang My Hanh²

ABSTRACT: Based on Fisher and Rook's research in 1995, this research applies the Stimulus Organism Response framework to determine the influence of reference groups on impulse buying. The study examines two reference groups (Normative referents and Comparative referents) as two independent variables, working as stimuli and making an impact on impulse buying behavior through two intermediary variables as organisms, namely trust and normative evaluation. By adapting Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA) and Structural Equation Modeling (SEM) to analyze the sample collected from questionnaires, the research provides a confirmation of the relationships among Normative referents (family and close friends), Comparative referents (celebrities), impulsive customers' Trust and Normative evaluation as well as the influence of these variables on customers' impulsive buying behavior.

Keywords: impulse buying; reference group; SOR model; normative evaluation; trust.

1. INTRODUCTION

According to a survey conducted in 2022, over 60 percent of internet users in Vietnam reported having purchased a product or service online. The number of online shoppers in the country has been growing steadily in recent years, reaching over 57.6 million people in 2022 (Nguyen, 2023). It is necessary for marketers and business owners to have a deep insight into consumers' online purchasing behavior.

The reference groups are factors that have considerable influence on impulse buying tendency. The reference groups expose people to lifestyles and behavior, which helps shape their attitudes and behavior to conform to social norms (Xiurong et al., 2010).

Reference groups resulting in online impulse buying behavior have not been thoroughly researched. The research gap was noticed when most research focused on impulse buying behavior occurring in-store (Lu, & Su, 2018). Empirical studies emphasized environmental stimuli such as the ambiance, website design and online feedback (Liu & Hu, 2013; Hong, Zulkiffli & Amran, 2021) rather than social factors like reference groups.

The Stimulus Organism Response (SOR) framework is widely used, signifying the relationship among (S) stimulus in the environment (reference groups), (O) organism related to emotional states of people, and (R) response illustrated by particular final behavior (online impulse buying behavior) (Mehrabian and Russell, 1974). Therefore, this study is to identify the moderating effect of two specific reference groups as a social stimulus on impulse purchasing behavior through two proven organisms: trust and normative evaluation. While trust increases consumers' confidence on the purchase (Thuong, 2020), normative evaluation is the subjective assessment towards the values of products and services (Zafar, 2021).

In conclusion, the influence of reference groups shall be further research to fill the gap in impulsive shopping online field, especially in Viet Nam. Particularly, the topic "*Influence of Reference group on*

¹ Foreign Trade University; Email: kimanhtranthi24@gmail.com

² Foreign Trade University.

Online Impulse Buying Behavior: a Stimulus Organism Response framework” will be presented at length with the data collected and analyzed in Ho Chi Minh city, which is known as a mega-city in Viet Nam with a high population.

2. THEORETICAL FRAMEWORK

2.1. Impulse buying theory

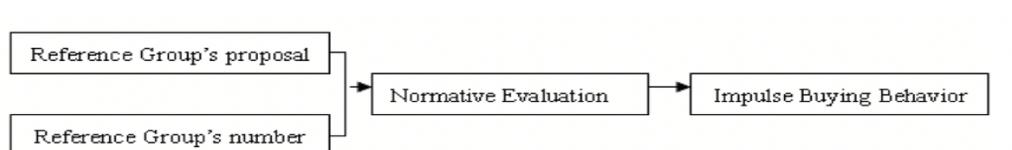

The term “Impulse buying” was first used by Hawkins Stern in 1962 to emphasize the phenomenon of “unplanned buying”: any purchase had not been planned, with the decision made in a shop. In contrast to earlier researches, the study of Rook (1987) claimed that not all unplanned purchases are impulsive buying but impulse buying should be clearly defined as “a sudden, often powerful and persistent urge to buy something immediately”. The definition of impulse buying extends along the development of shopping environment to online platforms. Piron (1991) described online impulse shopping as an immediate, unplanned purchase made through the internet.

The factors influencing impulse buying are divided into two kinds: internal motivators and external motivators. (Xiao & Nicholson 2013). However, Bussolari (2020) specialized these two factors into four: internal motivators, external motivators, demographic factors and situational factors.

Internal motivators refer to subjective factors such as behavioral trait (Atantra, 2022), self-discrepancy (Pupelis & Šeinauskienė, 2023), self-enhancement (Shrum, Chaplin, & Lowrey, 2022), high-arousal emotions (Jain, 2021); self-regulatory (Pacheco, 2022). Moreover, purchasing impulses can be significantly motivated by external motivators as well when a customer incidentally encounters a relevant visual stimulus in the retail environment such as in-store promotions and advertising, triggering shoppers to impulse buying (Grigsby et al., 2021), using mobile devices in-store as a guide for shopping (Aiolfi et al., 2022), self-agency as mediator in the influence on impulse buying behavior (Moes et al., 2022). Besides internal and external motivators, Demographic and Socio – Cultural factors related to age, gender and culture backgrounds (Bussolari, 2020). There are some social factors that incentivise customers to make impulsive purchases such as reference groups (Liu Xiurong & Liang Chenglei, 2010) and celebrities endorsement (Chen, Xie, Zhang & Li, 2021).

To research the influence of reference groups on impulse buying behavior, Liu Xiurong and Liang Chenglei (2010) used the SOR framework. The SOR model was originally invented by Mehrabian and Russell (1974) in order to analyze consumer purchases. This model includes three aspects: Stimulus (S) - the effect of environmental cues, Organism (O) is an internal process or condition that results in emotional responses. Response (R) is the outcome related to consumer behavior or avoidance. Stimuli are factors that are beyond a person’s control and have an impact on an organism’s internal states when they are exposed to external stimuli. An organism serves as a conduit for the connection between stimuli and behavior, and it also controls the outcome of the reaction to the stimulus. Liu Xiurong and Liang Chenglei (2010) considers the reference groups’ proposal (approving, neutral or discouraging) and reference groups’ number (multi-referent group or single-referent group). These two categories of reference groups work as stimuli and Normative Evaluation is Organism.

Figure 2.1. S-O-R model developed by Liu Xiurong and Liang Chenglei (2010)

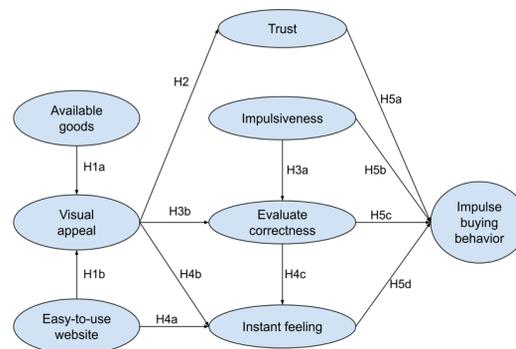

Source: Liu & Liang, 2010

This prior research shares the same objectives of our research that is to evaluate the impact of reference groups on impulse buying. However, this prior research does not focus on online contexts and divides reference groups into normative and comparative referents but has a different approach considering two perspectives reference groups.

Recently, although the SOR model is the most popular theoretical in the last decade, it is not only used to discover consumer behavior in stores but also to uncover online behavior. In Vietnamese context, the visual appeal characteristic of the online shopping websites which is contributed by the availability of products and the ease to use of shopping websites have been surveyed by Pham Quoc Trung and Nguyen Ngoc Thai Ha (2016) and Le Thi Kim Tuyet (2019) using the SOR model.

Figure 2.2. S-O-R model developed by Pham Quoc Trung and Nguyen Ngoc Hai Ha (2016)

Source: Pham & Nguyen, 2016

The SOR framework is widely applied to many studies by international researchers. It is used to identify impulse buying in live streaming commerce (Lee, & Chen, 2021), consumer online repurchase intention (Zhu, Kowatthanaku & Satanasavapak, 2020) or brand-related user-generated content through Facebook (Arif, Aslam & Siddiqui, 2020). Similarly, the SOR model offers an effective way of assessing online impulsive buying behavior with a comprehensive mechanism to explain the proposed relationships of variables.

2.2. Reference group theory

A reference group is a group of people that has a huge impact on one's behavior due to psychological Social group members who are psychologically significant to one's decision-making are referred to as the reference group (White & Dahl, 2006).

In fact, consumers consider the recommendations made by others as a benchmark when making purchases (Hwang, Mark, Jerry & Lin, 1999). When being unsure about adopting an e-marketplace or having insufficient knowledge, e-vendors frequently turn to informational reference groups to form a value standard and perception towards products (Lee et al., 2011). Moreover, reference groups can intervene in customers' needs and urge them to impulsively make a purchase.

Though there are many classifications of reference groups named differently, this study conclude them into two main groups based on their functions, impacts, and membership status: normative referents (primary or direct membership groups) and comparative referents (secondary or indirect aspiration groups) (Lessig & Park, 1978; Escalas & Bettman, 2003; Kelley, 1974).

2.2.1. Normative referents

Normative referents refer to reference groups to which an individual currently belongs to such as family and close friends. Most people hold a desire to meet expectations and gain acceptance from normative referents like parents, teachers, and peers (Myers, 2008, Pentina et. al., 2008).

2.2.2. Comparative referents

Meanwhile, comparative referents are reference groups which an individual desires to belong such as sports heroes and celebrities. A comparative reference group is a group whose lifestyles and activities are used as a model for others to follow (Childers & Rao, 1992).

2.2.3. Consumers' trust

Impulsive purchases may result from consumer behavior that is influenced by factors including security, usability, and trust (Donn, 2022). Trust is defined as “the willingness of a party to be vulnerable to the acts of another party based on the expectation that the other will perform a specific activity, regardless of the ability to monitor or control that another party” (Mayer, Davis & Schoorman, 1995). According to McKnight et al. (2002), consumers' intentions to buy are significantly impacted by the trust since it reduces uncertainty and risk perception in various online store contexts (Jarvenpaa et al, 2000, Sun & Wu, 2011).

2.2.4. Consumers' normative evaluation theory

Normative evaluations are defined as consumers' assessments of whether making an impulsive purchase in a specific buying scenario is suitable (Rook & Fisher, 1995). Moreover, Fishbein's Theory of Reasoned Action also points out that subjective norms stem from people's expectations of how important social referents will respond to a considered behavior and their motivation to do so. Recent consumer polls have revealed that while the majority of customers do not view their impulse purchases as being incorrect or wrong, a small percentage of consumers feel regret and guilt after making them (Hausman, 2000).

3. RESEARCH METHOD

3.1. Hypotheses

3.1.1 Normative referents and Trust

More than anything else, people build trust based on the experiences of their friends and relatives and place their confidence in their family (Hillman, Neustaedter, Bowes & Antle, 2012). Family recommendations or suggestions are significant not only in a person's life (AlArfaj, Solaiman & Marshall, 2019) but also purchasing behavior (Kotler et al., 2017).

H1: Normative referents (family and close friends) have a positive impact (+) impulsive customers' Trust.

3.1.2. Comparative referents and Trust

According to studies, celebrity endorsements increase consumers' trust in brands and advertised products (Chen, Xie, Zhang & Li, 2021; Dwivedi & Johnson 2013; Takaya 2017). Internet celebrities and regular consumers' recommendations may seem more genuine and powerful in fostering trust and boosting online sales (Hsu, Lin, Chiang & Sen, 2013).

H2: Comparative referents (celebrities) have a positive impact on (+) impulsive customers' Trust.

3.1.3. Normative referents and Normative Evaluation

Family and other close relationships which are considered to be important social subjects can impart norms, attitudes, and values through a lot of daily interactions. According to Li et al study (2008), people frequently follow key referents such as their family and close friends while making decisions. Receiving disapproval from important people (particularly family or friends) or the contrast of consumers' buying intent to social expectation (Shang, Pei & Jin, 2017) can prevent them from making decisions to purchase.

H3: Normative referents (family and close friends) have a positive impact on (+) impulsive customers' Normative Evaluation.

3.1.4. Comparative referents and Normative Evaluation

Celebrities and brand ambassadors can be utilized as a reference for evaluating and perceiving a brand normatively (Nofiwati et al., 2020). Most celebrities are seen as representatives of the community, leading trends and embodying common standards of the community. The presence of products in celebrities’ daily lives or advertisements works as recommendation that their fans will listen to (Kotler, Armstrong, Saunders & Wong 1999). Indeed, when celebrities advertise the product’s benefits, buyers can realize the perceived value and have a better assessment (Chi, Yeh & Tsai, 2011).

H4: Comparative referents (celebrities) have a positive impact on (+) impulsive customers’ Normative Evaluation.

3.1.5 Trust and Online Impulse Buying Behavior

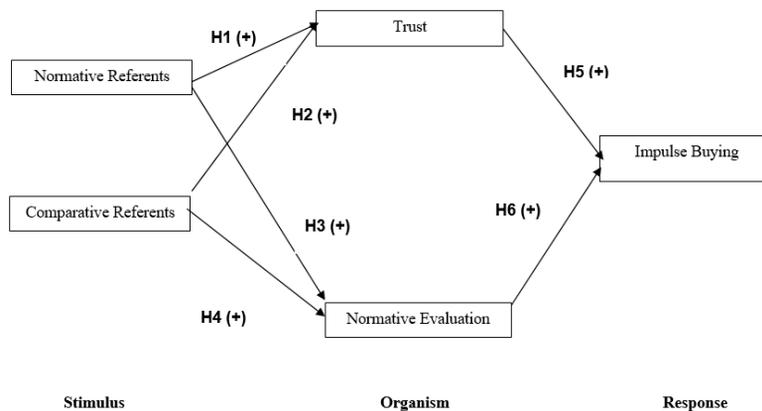

The emotive aspect of trust is associated with a willingness to take risks, whereas impulsive buying is viewed as a “risky” decision that may lead to decision errors (Chen, Xie, Zhang & Li, 2021). Trust can lessen the stress associated with impulsive behavior and enable transactions in the face of uncertainty (Verplanken & Sato, 2011). The SOR models examined in Vietnamese context by Tuyet (2019) and Trung and Hà (2017) suggested that trust is a decisive organism leading to online impulse buying behavior.

H5: Trust has a positive impact on (+) Online Impulse Buying Behavior.

3.1.6. Normative Evaluation and Online Impulse Buying Behavior

Impulsive purchase behavior is significantly and directly influenced by normative evaluations (Lim, 2015, Rook & Fisher, 1995). Consumers with higher normative assessment levels are more inclined to buy things on impulse because they believe it to be the proper thing to do (Yi, 2019). Therefore, researchers suggest the following hypothesis:

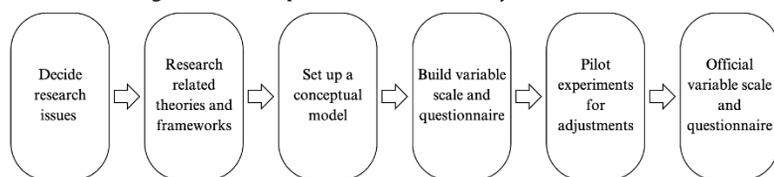

H6: Normative Evaluation has a positive impact on (+) Online Impulse Buying Behavior.

3.2. Research process

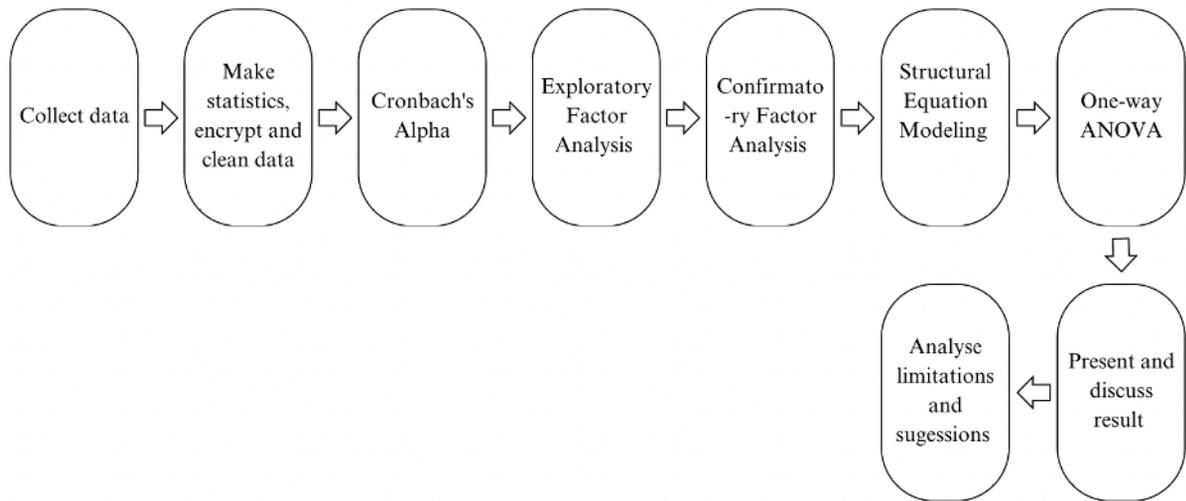

The research process of the thesis included two main stages: preliminary research and formal research.

Figure 3.2. The process of Preliminary research

Source: Authors’ compilation

Figure 3.3. The process of Formal research

Source: Authors' compilation

3.2.1. Questionnaire development

The researchers set up a questionnaire that applied the scale of measurement and research items based on the consultants from the empirical studies. The questionnaire has three sections to separately collect the information about demographic characteristics of participants (gender, age, average monthly expenditure, frequency of online purchases, time spent on browsing online group shopping websites), popularity of impulse purchases among online group shopping users (consulted from the questionnaire of Liu & Hu (2013)) and designated questions for test items.

Participants were asked to respond using a 7-point Likert scale, with 1 is “strongly disagree”, 2 is “disagree”, 3 is “somewhat disagree”, 4 is “neutral”, 5 is “somewhat agree”, 6 is “agree”, 7 is “strongly agree” for questions in the third section of the questionnaire.

Table 3.1. Scale development

Variable	Official scale	Source	Item (code)
Normative Referents (NR)	I purchase items that my family, friends and acquaintances recommend on online shopping websites.	Muslim et al. (2019)	NR1
	I purchase items that my family, friends and acquaintances give reliable reference information on online shopping websites.	Anh (2015)	NR2
	I purchase items with whom my family, friends and acquaintances have already had a positive purchase experience on online shopping websites.	Anh (2015)	NR3
	I purchase items that my family, friends and acquaintances use to adjust to the trend among the environment on online shopping websites.	Muslim et al. (2019)	NR4
Comparative Referents (CR)	The celebrities I follow raise things that catch my attention and response	Maltby et al. (2006)	CR1
	The celebrities I follow describe items objectively.	Xiao and Benbasat (2007)	CR2
	The celebrities I follow understand and have genuine experience with the items	Till and Busler (2000), Ohanian (1990)	CR3
	The celebrities I follow affect my shopping interest	Schramm and Hartmann (2008), Auter and Palmgreen (2000)	CR4

Trust (TRU)	I believe the recommendations of items are trustworthy.	Hsiao, et al. (2010)	TRU1
	I believe the recommendations of items are honestly made.	Ashraf et al. (2020)	TRU2
	I have confidence in the promises that the recommendations of items have made.	Doney and Cannon (1997), Kumar et al. (1995), Roy et al.(2001), Siguaw and Simpson (1998)	TRU3
Normative Evaluations (NE)	I find it acceptable to buy 4 items that I like on online shopping websites instead of buying 1 as planned.	Liu et al. (2013)	NE1
	I find it also fun to buy 4 items that I like on online shopping websites instead of buying 1 as planned.		NE2
	I find it makes sense to buy 4 items that I like on online shopping websites instead of buying 1 as planned		NE3
Online Impulse Buying Behavior (IB)	I had an urge to purchase items other than or in addition to my specific shopping goal when I browsed online shopping websites.	Valacich & Wells (2009)	IB1
	I had a desire to buy items that did not pertain to my specific shopping goal when I browsed online shopping websites.		IB2
	I had an inclination to purchase items outside my specific shopping goal.when I browsed online shopping websites.		IB3

3.2.2. Pilot experiment

The pilot experiment included an in-depth interview with 10 respondents and questionnaire distribution to another 30 respondents before the authors made appropriate adjustments to complete the official scale and questionnaire.

3.2.3. Sample collection

At the formal research stage, the authors collected 200 samples indirectly via an online network and the results obtained 193 satisfactory samples. Respondents are students in Ho Chi Minh City without any restriction regarding their universities. They are living in an area that is the most modern one in Viet Nam with a crowded e-commerce traffic for online shopping sites. At the age from 18 to 22, every participant is expected to have direct personal experiences making a purchase online. According to the research experience of Hair & Associates (1998), the minimum sample size should be from 100 - 150 . Besides, according to Bollen (1989), the selected sample will be representative if the sample size is at least 5 samples for an estimate. Here, the research model of the group includes 17 observed items, so the sample size to be selected should be 85 or more. Therefore, the research team decided to distribute 200 questionnaires to ensure the representativeness of the sample during the research.

3.2.4. Data analysis

After making statistics, encrypting and cleaning the collected data, the authors conducted analysis using SPSS and AMOS 21.0 analysis support software. The authors measured the reliability of the scale by Cronbach's Alpha reliability, evaluated the model fit by Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA) and tested the hypotheses and qualitative variables by Structural Equation Modeling (SEM) and One-way ANOVA.

Structural Equation Modeling (SEM) is the main statistical analysis technique used in this study to analyze multidimensional relationships among many variables in a model (Haenlein & Kaplan et al. , 2004. . Specifically, a few recent typical studies in the research topic of buying behavior can be mentioned, Zhu, Kowatthanakul and Satanasavapak (2020) study the intention to continue buying online of customers of the generation Y is based on the Stimulus-Organism-Response (SOR) model on 401 survey samples, the SEM

model is illustrated and tested by AMOS 24; Iyer, Blut, Xiao and Grewal (2020) collected 231 survey samples and researched on the relationship between internal factors (traits, mood, motivation,...) and external factors (price, marketing strategy,...) with online impulse buying behavior by CB-SEM model deployed by LISREL 8.80; Chen, Xie, Zhang and Yingying Li (2021) study on celebrities affecting impulsive buying behavior of high-end fashion products with 245 data samples analyzed using PLS- SEM using SmartPLS 3.0 software. Moreover, the authors found that recent studies on impulse buying behavior with a research model having a similar SOR structure, most of them use SEM to analyze data and get results that are consistent with the theories. Ming, Jiangqiu and Bilal (2021) conducted a study about how social presence influences impulse buying behavior in live streaming commerce with a research model following S.O.R model, which has Stimulus group including four independent variables of different social presence factors, Organism group consisting intermediary variables of consumer trust and flow state that directly affects the impulsive buying behavior in Response group. Another recent study on online shopping experience affects online impulse buying behavior of customers (Gulfraz et al., 2022) with similar research model structure including independent variables of online customers' shopping experience, intermediary variable of loyalty towards e-commerce platform and dependent variable of online impulsive buying. Therefore, based on the properties of SEM and previous studies, both of which are feasible when testing by SEM, the authors believe that SEM is a good approach for this study based on covariance (CB-SEM) and processed by AMOS software.

4. RESULTS AND DISCUSSION

4.1. Results

4.1.1. Checking the scale by examining the Cronbach's Alpha reliability test

In the first analysis, the Cronbach's Alpha of the variables are more than 0.7 . Moreover, each item in corrected item-total correlation is greater than 0.3. The Cronbach's Alpha results are: 0.733 for Normative Referents; 0.850 for Comparative Referents; 0.870 for Trust; 0.866 for Normative Evaluations; 0.769 for Online Impulse Buying Behavior. The Cronbach's Alpha test findings indicate that the 17 significant items are reliable and qualified for further use in EFA exploratory component analysis.

4.1.2. Exploratory Factor Analysis (EFA)

Based on the consequences of rotating factors, there are 15/17 with loading coefficients greater than 0.5 . Particularly, the items NR1 and NR4 have small loading factors of 0.382 and 0.336, which are less than 0.5, so they will be excluded from the scale. The results of adjusted scale are:

Table 4.2. Summarizing the results of the coefficients in the EFA factor analysis for adjusted scale:

Assessed factors	Value	Compare to criteria
Sig value in Bartlett's test	0.000	0.000 < 0.05
KMO coefficient	0.808	0.5 < 0.808 < 1
Quoted variance	64.177	64.177% > 50%
Eigenvalue	1.169	1.169 > 1

Table 4.3. Summarizing the results of rotating the factors for the second time

Variable	Item	Factor				
		1	2	3	4	5
CR	CR2	.845				
	CR3	.776				
	CR1	.762				
	CR4	.709				
NE	NE1		.968			
	NE2		.768			
	NE3		.686			
TRU	TRU3			.854		
	TRU2			.838		
	TRU1			.803		
IB	IB2				.831	
	IB3				.652	
	IB1				.570	
NR	NR3					.715
	NR2					.662

Source: SPSS

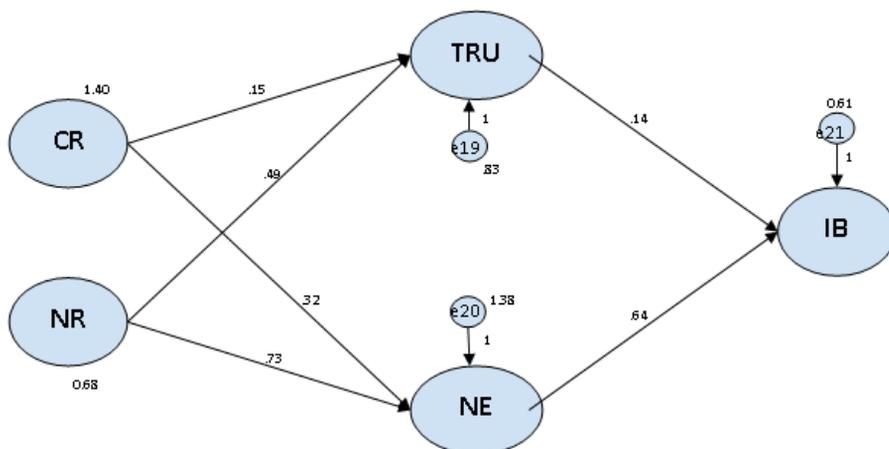

According to Figure 4.6, all 15 items have the loading coefficients greater than 0.5 and they are classified into 5 groups of factors as the original model.

4.1.3. Confirmatory Factor Analysis (CFA)

The results of CFA indicate that $\chi^2/DF = 1.642 < 3$ which is a good value; the model has $p\text{-value} = 0.000 < 0.05$; $CFI = 0.961 > 0.95$ which is a good value; $GFI = 0.915 > 0.9$ which is traditional value; $RMSEA = 0.062$ which is close to a good fit; $TLI = 0.949 > 0.9$ which is a good value. All values fall within the suggested values shown in figure 3.2.3. As a result, it can be said that there was a good fit between the model and the observed data.

4.1.4. Structural Equation Modeling (SEM)

Figure 4.1. Summarizing SEM diagram

After completing the construction of the diagram for SEM and conducting SEM analysis, the software produces 3 main results tables: Regression Weights, Standardized Regression Weights, Squared Multiple Correlations corresponding to the proposed hypotheses as follows:

Table 4.5. Summarizing the results of Regression weights

	Estimate	S.E.	C.R.	P	Result
H1: NR → TRU	.494	.126	3.914	.000	Supported
H2: CR → TRU	.146	.069	2.115	.034	Supported
H3: NR → NE	.734	.173	4.244	.000	Supported
H4: CR → NE	.322	.092	3.484	.000	Supported
H5: TRU → IB	.140	.103	1.363	.036	Supported
H6: NE → IB	.543	.074	7.350	.000	Supported

Source: AMOS

Using the 95% confidence standard, we have the hypothesis testing results as follow:

H1: Normative referents (family and close friends) have a positive impact (+) impulsive customers' Trust.

The positive impact of normative referents on customers' trust has been proved by empirical research. AlArfaj, Solaiman and Marshall (2019) concluded that the primary source of consumers' trust is normative referent group which are family and friends as well as family recommendations or suggestions are more significant in a person's life.

H2: Comparative referents (celebrities) have a positive impact on (+) impulsive customers' Trust.

This finding supports the conclusion that celebrity endorsements increase consumer trust in brands and advertised products (Chen, Xie, Zhang & Li, 2021)

H3: Normative referents (family and close friends) have a positive impact on (+) impulsive customers' Normative evaluations.

The result confirms that people will make a comparison with the social basis as the evaluation criteria if they lack objective standards to evaluate their own attitudes and activities (Hwang, Mark & Jerry, 1999). There is pressure for consumers to avoid buying items which are not in line with social expectations (Shang, Pei & Jin, 2017).

H4: Comparative referents (celebrities) have a positive impact on (+) impulsive customers' Normative evaluations.

The result can be interpreted that famous people have a certain degree of influence on customers' feelings when they decide to purchase impulsively. This also supports Jin and Ryu finding (2020) that celebrities and ambassadors who are well-liked and well-known will positively affect consumers' feelings and buying intentions. Moreover, celebrities and brand ambassadors can be utilized as a reference for evaluating and perceiving a brand normatively (Nofiawati et al., 2020).

H5: Trust has a positive impact on (+) Impulse Buying.

Although the estimated parameter of TRU is not very high, it is consistent with tested hypotheses that brand trust had a positive impact on purchase intention with a path coefficient was 0.250 (Cuong, 2020).

H6: Normative evaluation has a positive impact on (+) Impulse Buying.

The result is similar to the conclusion of Lim (2015) that impulsive purchase behavior is significantly and directly influenced by normative evaluations.

Continue to consider the Standardized Regression Weights table, this is the standardized regression coefficients table. We will rely on the estimated regression coefficient in this table to evaluate the impact of the independent variables on the dependent variable.

Table 4.6. Summarizing the results of Standardized regression weights

	Estimate
NR → TRU	.402
NR → NE	.441
CR → TRU	.171
CR → NE	.277
TRU → IB	.151
NE → IB	.685

Source: AMOS

Finally, the Squared Multiple Correlations table represents the R squared value of the impact of the independent variables on the dependent variable.

Table 4.7. Summarizing the results of Squared multiple correlations

	Estimate
TRU	.191
NE	.271
IB	.489

Source: AMOS

The R-squared value of TRU is $0.191 = 19.1\%$, so the independent variables affect 19.1% of the variation of TRU. Similarly, the R squared of NE is $0.271 = 27.1\%$, so the independent variables affect 27.1% of the variation of NE. R-squared for IB is $0.489 = 48.9\%$, so the independent variables affect 48.9% of the variation of IB.

4.1.6. Analysis of the influence of moderator variables on online impulse buying behavior

To statistically test the difference in means of the groups at each level of gender, age, monthly spending and surfing time on online sites moderators, the authors separately conducted ANOVA analysis of variance for each moderator. The results of ANOVA analysis reach the significance level of less than 5%, it can confirm that there is a difference in buying behavior between the categories of respondents.

Table 4.8. ANOVA analysis result for moderator variable

Moderator Variable	Sig. of Levene	Sig. Observed significance level	Result
gender	0.006	0.028	Significant difference
age	0.209	0.000	Significant difference
monthly spending	0.539	0.031	Significant difference
surfing time on online sites	0.706	0.013	Significant difference

There is a statistically significant difference between the two sample means from female and male data. The moderating effect of Gender on impulse buying has been proved by many empirical studies. The study about Gender difference in impulse buying conducted by Tifferet and Herstein (2012) concludes that women impulse buying levels are higher than men as sensual cues are more appealing to women than men.

The Sig. Observed significance level of the Age moderator variable is near to zero proving the significant difference between age groups with higher value for older groups, except the oldest. The reason for this exception is supposed to be that the age difference of the research subjects is not too much (from 18 to 23) and the number of survey samples in the older groups is significantly less compared to other age groups.

It is reasonable that the group whose higher monthly expenditure presents higher mean value of online impulse buying behavior variable. This finding supports Muruganantham and Bhakat’s study conclusion (2013) about the money available can leverage the impulse buying behavior in online shopping websites.

Our research confirms Beatty and Ferrell’s (1998) finding that the likelihood of making an impulse purchase increases with the amount of time spent by shoppers (i.e., available time). The amount of time that internet shoppers, especially with online shoppers who love purchasing experience, spend browsing online websites more idly may trigger their decision to impulsively buy goods.

4.2. Discussion

By testing the reliability of the scale and analyzing factor discovery, it was concluded that from the 17 initially proposed observed variables, only 15 independent observed variables remained and were grouped into 5 groups of factors to include in the SEM model: Comparative referents (CR), Normative referents (NR), Trust (TRU), Normative evaluation (NE) and Impulse buying (IB). In which, independent variables are CR and NR; intermediary variables are TRU and NE; dependent variables are IB.

After running the SEM model test using AMOS 21.0 software, the model shows that all four groups of factors have a positive influence on impulse buying behavior as the research hypotheses have proposed. Specific results are as follows:

The relationship between impulsive customers’ trust and normative referents (family and close friends) has an estimated value of 0.494 while Comparative referents (celebrities) is 0.146. The result of the relationship between normative referents (family and close friends) and impulsive customers’ trust is consistent with previous studies. Family recommendations or suggestions are more significant in a person’s life (AlArfaj, Solaiman & Marshall, 2019) as well as purchasing behavior (Kotler et al., 2017). However celebrities have an impact on impulse buying which is not as strong as preceding research had concluded.

The relationship between impulsive customers’ Normative evaluation and normative referents (family and close friends) has an estimated value of 0.734 and with Comparative referents (celebrities) is 0.322. It could be concluded that consumers pay more attention to the advice and recommendations of acquaintances when making impulse purchases. Therefore, customers’ standards in terms of assessing and purchasing products are likely to be heavily influenced by normative referents.

The relationship between Impulse Buying and Trust has an estimated value of 0.140 while with Normative Evaluation is 0.543. This shows that customers' normative evaluations influence their impulsive buying decisions more than their' trust factor does. The result of the impact of trust on impulse buying is quite inconsistent with the hypothesis that was supported in the past researches: In most online impulse buying behavior studies using the SOR model, trust is suggested as a decisive organism when examining a specific stimulus that leads to the response (Tuyet, 2019; Trung & Hà, 2017). This shows that today's young consumers in Ho Chi Minh City tend to prioritize their overall assessment of the utility which is based on perceptions between gain and loss (Moreover & Woodruff, 1997) over the certainty of feelings based on circumstantial evidence from the online marketplace (McKnight, Choudhury & Kacmar, 2002).

The adjusted R-squared coefficient of the impulsive buying factor 48.9% is not too high. The reason for this is that the error is included when the sample size is small and there are absent variables that have not been taken into the model.

In addition, the results of the analysis of the moderating variables all support the pre-existing theories. In terms of gender, female customers are significantly more likely to impulsively shop online than male customers (Tifferet & Herstein, 2012). When considering monthly spending as the ability to pay for shopping, people with higher spending levels tend to make a purchase more impulsively (Muruganatham & Bhakat, 2013). According to Beatty and Ferrell's study (1998), as surfing online shopping sites more enhances the shopper's experience, the increasing time spent on online shopping websites leverages the likelihood of customers making impulse purchases.

5. CONCLUSION

After the COVID pandemic, the trend of online shopping has become increasingly popular, notably the phenomenon of online impulse purchases. The research "*Influence of reference group on online impulse buying behavior: A stimulus-organism-response framework*" determines and evaluates the influence of reference group speed on online impulse buying behavior of university students in Ho Chi Minh City based on SOR model considered to be the most reliable conceptual framework in this field. At the same time, the study provides a number of results and recommendations to help buyers become more aware of their own shopping behavior to make appropriate adjustments and businesses create executions that indirectly affect customers' decision through the reference group to increase sales.

With 193 valid samples processed by SPSS and AMOS 21.0 software by Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA) and Structural Equation Modeling (SEM), the study showed the influence of two reference groups (Normative referents and Comparative referents) on online impulsive shopping behavior of students in universities in Ho Chi Minh City through two organisms, Trust and Normative evaluation. The results show that all variables have a positive impact on impulse buying behavior as the proposed hypotheses. In addition, the research results support the relationships between moderating variables such as gender, monthly spending level, time spent surfing online shopping websites and impulsive behavior of university students in Ho Chi Minh City.

With objective limitations in terms of time and funding, the study still has some limitations in terms of research scope, survey subjects and sampling method, leading to the research results not being highly generalizable. However, the study has produced positive results that support and complement previous studies in the field of research on impulse buying behavior. Future studies should include other factors of the organism group such as social-well being or self-control into the model to better explain the factors affecting impulse buying behavior of students in Ho Chi Minh City. In addition, The representativeness and

statistical efficiency of the study will be enhanced if further studies use probabilistic sampling with larger sample sizes.

IMPACT OF PERCEIVED VALUE AND PERCEIVED RISK ON ORGANIC FOOD CONSUMPTION IN VIETNAM

**Author: Pham Thi Ha¹, Dang Thi Hang², Nguyen Thi Xuan Mui²,
Than Thi Thu Phuong², Nguyen Hoai Nam²
Mentor: Phan Thi Thu Hien²**

ABSTRACT: This study aims to identify impact of perceived value, perceived risk on purchase intention in organic food of Vietnamese consumers. Data is obtained from 206 consumers, especially in Ha Noi. The reliability of measures was tested by using Cronbach's Alpha coefficient, measurement model, and structural model to evaluate the reliability of measures and model testing. Based on PLS-SEM method, positive impact of perceived value, perceived risk on intention of organic food consumption of Vietnamese consumers is found through expectation, confirmation and satisfaction. In fact, if consumers realize values and risks of organic food consumption for themselves and their families, intention of organic food consumption will be increased. In addition, a moderating role of trend is also found in this study. With the popularization of organic food consumption, consumers' intention to consume organic food will also increase. Finally, based on the research results, food companies can refer to it to determine new directions in the future, or researchers can re-study to verify the research results.

Keywords: perceived value, perceived risk, expectation-confirmation theory, organic food.

1. INTRODUCTION

In recent years, food hygiene has always been a concern for the whole society. There have been many food poisoning incidents in Vietnam, specifically: according to the Ministry of Health report, 54 food poisoning cases resulted in 1,359 poisoning cases, of which 18 died (Trang, 2022). As a result, health protection is at the forefront of consumers. As a result, the consumption of clean, healthy foods has increased, leading to the consumption of organic foods.

Worldwide, retail sales from organic food have truly reflected the growth of this food consumption trend. In 2000, sales from the organic agricultural market reached only \$18 billion but by 2018, the number had increased about 6 times, exceeding the \$100 billion mark, indicating the rapid growth of this new market. According to the latest data released by the Institute for Organic Agriculture (FiBL) and the Global Organic Organization IFOAM, in 2021, the market reached 125 billion euros, which is nearly 4 billion euros (about 3%) increase from 2020. The average Swiss consumer spends about 425 euros on organic food and is the world's largest consumer of this product. The consumption of organic food has also grown tremendously in Denmark with 13 percent of organic food market share, the highest in the world, followed by Australia (11.6 percent) and Luxembourg (11%) (Helga Willer, 2023).

In Vietnam, revenue is estimated to be over 2 million Euro (2014), but in just 2 years the figure has increased ninefold to 18 million Euro (2016) (Helga Willer, 2023). Compared to other organic food markets around the world, the number of 18 million is still modest, but the two-year growth rate has shown an increasing trend of demand for this food and the potential for the organic food market in Vietnam. The trend of organic food consumption is a new but thriving trend, which has attracted researchers. Many studies have been conducted in Viet Nam, on the intention of organic food consumption and commonly used factors: price,

1 Foreign Trade University, Email: k60.2114210031@ftu.edu.vn

2 Foreign Trade University.

attitude, beliefs, environmental knowledge, health, etc; there is no study on the impact of perceived value and perceived risk. Therefore, on the basis of evaluating the impact of perceived value and perceived risk on organic food consumption, the study aims to propose solutions to promote the positive impact of perceived value and minimize the impact of perceived risk in organic food consumption in Viet Nam. Specifically, the objectives of the study are building a model to analyze and evaluate the impact of perceived value and perceived risk on the intention to consume organic food of Vietnamese consumers; theoretical basis system about the impact of perceived value and perceived risk on organic food consumption of Vietnamese consumers; evaluating the current status of the impact on perceived value and perceived risk on intention consumption of organic food by Vietnamese consumers and proposing solutions and recommendations to improve the impact of perceived value and perceived risk of Vietnamese consumers' intention to buy organic food.

2. THEORETICAL FRAMEWORK

2.1. Perceived value theory

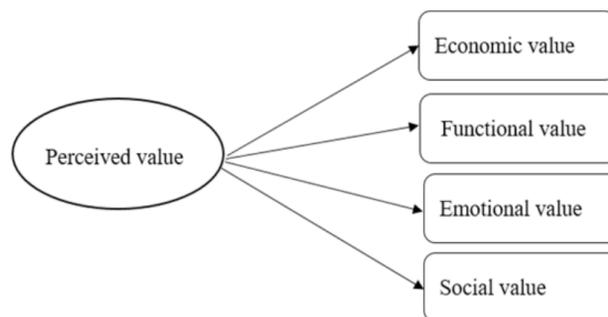

Figure 1. Perceived Value Model

Source: Sweeney and Soutar (2001)

Studies have shown that perceived value is the main factor affecting consumer buying attitude (Kim, Woo, and Nam 2018). Perceived value refers to the consumer's overall assessment of a product's utility and is based on perceptions of what is received and what is given (Zeithaml 1988). According to Sweeney and Soutar (Sweeney and Soutar 2001), perceived value includes quality, emotion, price, and social value. (Sheth, Newman, and Gross 1991) argues that perceived value includes functional, social, emotional, and conditional values.

2.2. Perceived risk theory

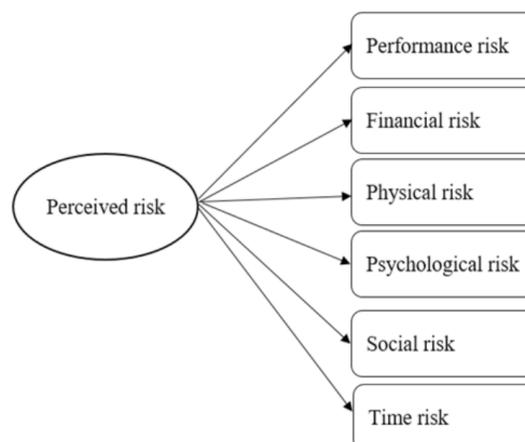

Figure 2. Perceived Risk Model

Source: Jacoby & Kaplan (1972)

Perceived risk refers to the nature and degree of risk that consumers perceive when considering a particular purchase decision (Cox and Rich 1964). (Mitchell and Vassos 1997) suggests that because consumers are often more motivated to avoid losses than to maximize utility in their purchases, perceived risk has a strong impact on explaining the behavior of consumers. The consumer’s behavior involves risk because the actions of the purchase “will produce consequences which he cannot anticipate with anything approximating certainty and some of which at least are likely to be unpleasant” (Baumer, 1960).

2.3. Expectation - Confirmation theory

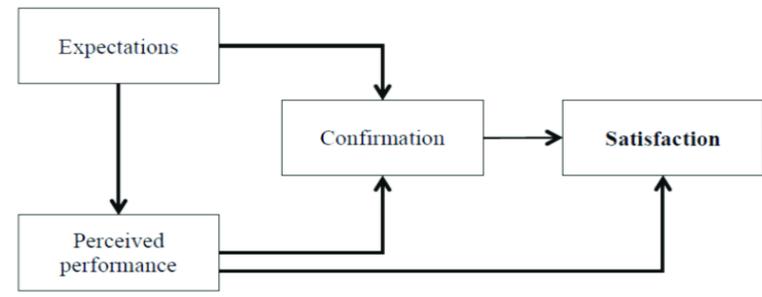

Figure 3. Expectation – Confirmation Model

Source: Oliver (1977)

The expectation-confirmation theory (ECT) of (Oliver R. L., 1977) (Oliver, 1980) posits that expectation, along with perceived performance, affects consumers’ satisfaction when using products and services. This effect is mediated by a positive or negative disconfirmation between expectations and performance. If perceived performance of a product is greater than expected (positive disconfirmation) then it will lead to satisfaction. If perceived performance of a product is lower than expected (negative disconfirmation), that can lead to dissatisfaction. In addition, the theory suggests that perceived performance directly affects satisfaction (Oliver, 1980). Finally, satisfaction affects intention or behavior.

2.4. Relationship between health benefit and environmental benefit with social value

With increasing public health awareness, more and more consumers are starting to think about consuming healthy food (Huang et al. 2022). This has also been fueled by an increase in marketing of organic and healthy foods, where many consumers fear being obese. Organic food is grown without the use of synthetic pesticides, fertilizers and other chemicals commonly used in conventional farming. Therefore, organic food is said to be healthier than conventionally farmed food. Choosing organic food is seen as a way of prioritizing personal health and well-being, which is a social value behavior.

Over the past few decades, consumers have become more aware of the environmental impact in their purchasing decisions (Kim & Chung, 2011). By choosing to consume organic food, individuals are contributing to a large movement to protect the environment, which is a socially appreciated behavior.

Thus, it was hypothesized that:

Hypothesis 1: Health benefit positively impact on social value.

Hypothesis 2: Environmental benefit positively impact on social value.

2.5. Relationship between product attribute with perceived quality

Product attribute is the features and uses of a product to satisfy customer needs. To distinguish and identify a product, product attribute plays an important role in the customer evaluation process. In a study of the motivations of organic food buying behavior (Davies, Titterington, and Cochrane 1995) revealed that

along with environmental and health-conscious concerns, safety, quality concerns and purchase motives were also attributed to specific product attributes, such as nutritional value, taste, freshness and price. Nigerian consumers believe that organic food is healthier, tastier, has no harmful effects, and is of better quality than inorganic food (Monroe & Krishnan, 1985). The nutritional properties of organic food have given it a competitive advantage over conventionally produced goods (Michaelidou and Hassan 2010).

Thus, it was hypothesized that:

Hypothesis 3: Product attribute positively impact on perceived quality.

2.6. Relationship between emotional appeal, perceived price, perceived quality and social value with perceived value

Emotional value is defined as the feelings or emotions caused by a product or service (Sheth et al. 1991). These emotions (positive or negative) vary in situations and individuals, which can influence consumer behavior. In addition, (Seegebarth, Behrens, Klarmann, Hennings, & Scribner, 2016) considers emotional value as a personal perception of the value of that product. Recent research has shown that these emotional values lead to organic food consumption (Testa, Sarti, and Frey 2019).

Perceived price is the monetary value of a product that has a significant influence on a customer's decision-making process. High prices have been pointed out as one of the reasons that hinder customers in making purchasing decisions (Perrini et al. 2010). Therefore, perceived price negatively affects perceived value. (Dodds, Monroe, and Grewal 1991) highlighted the negative effect of perceived price on perceived value.

Perceived quality is conceptualized as "the consumer's judgment about a product's overall excellence or superiority" (Zeithaml 1988), which affects positively on perceived value (Oxfam, 2002). Many past research studies suggested that perceived quality has a positive impact on perceived value (Grewal et al. 1998; Hartline and Jones 1996; Teas and Agarwal 2000; Zeithaml 1988). (Dodds et al. 1991) defined perceived value as "a cognitive trade-off between perceived quality and sacrifice". Therefore, perceived value is one of the determining factors of perceived value.

Social value is defined as the benefits produced through an individual's association with one or more social groups when choosing a product (Rahnama 2016). As a result, consumers often tend to consume products that are positively recognized in their social groups and strengthen their social status (Vindigni, 2002). Recent studies have also suggested that social values have a positive influence on consumers' organic food consumption behavior (Khan and Mohsin 2017).

Thus, it was hypothesized that:

Hypothesis 4: Positive emotional appeal contributes to higher perceived value, while negative emotional appeal reduces perceived value.

Hypothesis 5: Perceived price has an adverse effect on perceived value.

Hypothesis 6: Perceived quality has a direct impact on perceived value.

Hypothesis 7: Social value positively impacts on perceived value.

2.7. Relationship between food neophobia with consumer psychological risk

Neophobia refers to the fear or reluctance to try new, unfamiliar foods (Fischler, 1988), (Pliner & Hobden, 1992). Neophobia reflects a natural human tendency to dislike or be suspicious of novel foods (Pliner & Salvy, 2006) (Knaapila, et al., 2007) (Dovey, P.A., Gibson, & Halford, 2008). (Asperin, Philips, & Wolfe, 2011) defined Neophobia as a personality trait that exists in every human being, which influences the willingness to try and consume new foods.

Thus, it was hypothesized that:

Hypothesis 8: Food neophobia increases psychological risk.

2.8. Relationship between psychological risk and financial risk with perceived risk

Financial risk is defined as the probability of monetary loss associated with the purchase a product (Horton 1976). Financial composition refers to a customer's net financial loss (Horton 1976), which includes the possibility of product failure and may require repair or replacement. (Nhung et al.) points out that Vietnamese consumers need a basis to ensure to buy organic products that they accept to pay extra, more expensive than conventional products. However, consumers may be more worried about the risk that the value of organic food is not worth with the money they spend.

Psychological risk refers to the concern that purchasing a product will conflict with the consumer's self-image (Kim & Lennon, 2000), which causes frustration or disappointment from that purchase. In other words, it is the possibility that consumers will experience mental stress as a result of their buying behaviors. Thus, psychological risk increases consumers' perceived risk of organic food, making them less inclined to consume organic food.

Thus, it was hypothesized that:

Hypothesis 9: Psychological risk increase perceived risk.

Hypothesis 10: Financial risk increase perceived risk.

2.9. Relationship between perceived value and perceived risk with expectation

Perceived value plays an important role in exchange activities, considering that consumers evaluate the utility of products based on what they receive from what they give (Wu, Chen, Chen, & Cheng, 2014). (Lam, Lau, & Cheung, 2016) see perceived value of green products as the types of benefits or values that consumers can receive from green products compared to what they sacrifice for price and search time to make their purchasing decisions. It also plays an essential role in influencing purchasing intentions, purchasing decisions and actual consumption (Yee, San, & Khoon, 2011) (Zhuang, Cymiskey, Xiao, & Alford, 2010). For green products, (Lam, Lau, & Cheung, 2016) found that perceived value is a positive force of purchase intention.

Perceived risk is related to the expectation of loss from any purchase of organic food (Peter and Ryan 1976). (Bäckström, Pirttilä-Backman, and Tuorila 2004) find that people will worry about the risks associated with their food. If consumers have a high perceived risk, they may have lower expectation with the quality and value of organic products, and they tend to stay away from organic products. Therefore, it leads to a decline in the organic food production industry, as consumers lack trust to buy and use organic products.

Thus, it was hypothesized that:

Hypothesis 11: Perceived value positively impacts on expectation.

Hypothesis 12: Perceived risk negatively impacts on expectation.

2.10. Relationship between expectation with confirmation

If consumers have high expectation for organic products, they will tend to trust and be willing to buy them. However, if consumer's expectation is not met or organic products do not meet quality standards, consumers may lose trust and will have no confidence in organic products.

Thus, it was hypothesized that:

Hypothesis 13: Expectation positively impact on confirmation.

2.11. Relationship between confirmation with satisfaction

Liu et al.,(2020) believes that there is positive or negative disconfirmation of customer expectation through the performance of the product or service. With user experience from using the system, thoughts and attitudes can change. Contrary to customer expectation, customer evaluation of performance will affect perceived of expectation – disconfirmation (Liu et al. 2020).

Thus, it was hypothesized that:

Hypothesis 14: Confirmation has a favorable impact on satisfaction.

2.12. Relationship between satisfaction with purchase intention

Satisfaction is the response of the consumer, the measure of satisfaction is pleasant or unpleasant. (Oliver R. , 2009). (Johnson M. N., 1996) described two basic concepts of satisfaction are specific transactions and accumulation. A particular transaction satisfaction is a momentary assessment of a particular transaction experiencing a product or service, while accumulated satisfaction describes the total consumption experience of a product so far. Consumer satisfaction has been conceptualized on both sides (e.g., emotion) and cognitive response (Westboork & Oliver, 1991).

Purchase intention is considered to be intermediate between satisfaction and actual loyalty (Evanschitzky & Wunderlich, 2006) (Oliver R. , 2009), and different from repurchase behaviour (Mittal and Kamakura, 2001). A positive association between satisfaction and purchase intention is well established in the literature (Kassim & Abdullah, 2010), (Johnson, Herrmann, & Huber, 2006), (Mazursky and Geva, 1989), (Szymanski and Henard, 2001), (Walsh et al., 2008).

Thus, it was hypothesized that:

Hypothesis 15: Satisfaction has a direct impact on purchase intention.

2.13. Moderating of Trend and Government's food production support work

One reason for consumers buy organic products is the satisfaction of finding new trends in health food products (Roitner-Schobesberger, Darnhofer, & Vogl, 2008); (Sangkumchaliang & Huang, 2012). In this sense, the consumption of organic food has become a trend (Falguera, Aliguer, & Falguera, 2012). Consumers perceived organic food as fashionable (Costa et al., 2014; Petrescu and Petrescu-Mag, 2015) and buy it because it is considered such (Sharma and Singhvi, 2018)

The government can intervene in food production through subsidies in agriculture and preferential policies, as well as by controlling the use of poultry and livestock medicines, fertilizers and pesticides, maintaining and building agricultural land and living environment ecosystems (Scalvedi and Saba 2018), called "Government's food production support work". If people are satisfied with government support and monitoring of agricultural products, the trust in the production process and quality of organic food is strengthened, which increase the willingness to consume organic food (Chai, Meng, and Zhang 2022).

Thus, it was hypothesized that:

Hypothesis 16: Trend moderates from expectation to purchase intention.

Hypothesis 17: Government's food production support work moderates the impact from expectation to purchase intention.

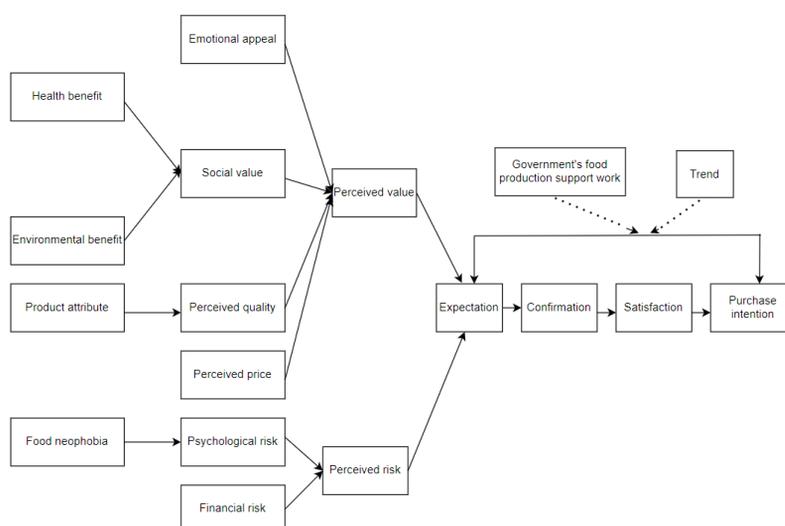

Figure 4. Research model

3. RESEARCH METHOD

This study examines the impact of perceived value, perceived risk on organic food consumption in Viet Nam based on perceived value theory, perceived risk theory and confirmation - expectation theory. In addition, the study also examines the moderating impact of Government’s food production support work and trends on the relationship between perceived value and perceived risk on organic food consumption in Viet Nam. Through the quantitative data collection method and using the questionnaire to collect data, this study analyzed the data based on PLS-SEM method. Based on a list of 215 people in Ha Noi that have been compiled through random sampling, the study surveyed consumers above. After the survey period from January to March 2023, the study collected 206 valid questionnaires, achieving a 95.81% response rate.

In this study, SPSS 20 and Smart PLS 4 software were used to conduct data analysis by PLS-SEM method. The two steps for implementing the PLS-SEM method include the measurement model evaluation and the structural model evaluation (Hair et al., 2017). According to Shiau et al (2019), in this case of this study, when the obtained sample size is relatively small, the PLS-SEM method should be applied. To measure variables in the study model, the scales inherited from previous studies were used.

Table 1. Variable, indicators, source of scales

Variable	Indicators	Source of scales	Encode
Health Benefit	HB1. Organic food is beneficial for health HB2. Organic food is produced in natural way HB3. I feel safe as organic food is free from chemical infusions	(Sumi and Kabir, 2018)	HB
Environmental Benefit	EB1. Organic food is more environment-friendly EB2. Organic food is produced from organic manure EB3. Organic food is produced by using natural pesticides	(Sumi and Kabir, 2018)	EB
Perceived Social Value	SV1. Organic food helps me to feel accepted by others. SV2. Organic food improves the way I am perceived. SV3. Organic food makes a good impression on other people. SV4. Organic food gives me social approval.	(Seegebarth et al., 2016)	SV

Product Attributes	PA1. Organic food is a natural product PA2. Nutrient value is more in organic food PA3. Organic food is tastier	(Sumi and Kabir, 2018)	PA
Perceived Quality	PQ1. I think quality of organic tea is superior than traditional PQ2. Positive image of organic food inspires me to buy organic tea PQ3. Organic tea is better substitute than conventional tea	(Sumi and Kabir, 2018)	PQ
Perceived Price	PP1. Price of organic food is affordable PP2. Less price difference from traditional food PP3. Paying more for organic food is worthy	(Sumi and Kabir, 2018)	PP
Emotional Appeal	EA1. Organic food helps you cope with stress EA2. Organic food helps you relax EA3. Organic food keeps you alert EA4. Organic food cheers you up EA5. Organic food makes you feel good	(Japutra et al., 2022)	EA
Perceived Value	PV1. I find positive value in terms of benefits and costs of organic tea PV2. High price of organic tea creates great value to me	(Sumi and Kabir, 2018)	PV
Financial Risk	FR1. I believe the value of organic food is more than the money I spend FR2. I believe the value that organic food brings is worth the money I spend FR3. I fear the value that organic food brings is not worth the money I spend	(Herrera and Blanco, 2011)	FR
Food Nephobia	FN1. I am constantly sampling new and different foods FN2. I do not trust new foods FN3. If I do not know what is in a food, I won't try it FN4. I am afraid to eat things I have never had before FN5. I will eat almost anything	(Ayyub et al., 2018)	FN
Physiological Risk	PS1. I am afraid that my purchase may make me feel uncomfortable PS2. I am afraid of feeling dissatisfied or frustrated	(Fandos Herrera and Flavián Blanco, 2011)	PS
Perceived Risk	PR1. I believe that consuming organic food is risky because it may not live up to my expectations PR2. I believe that consuming organic food is risky because the production process may not be standardized PR3. I believe that consuming organic food is risky because it can be time consuming to verify the origin	(Chang and Chen, 2008)	PR
Governments food Production support work	GP1. Supervise the use of livestock and poultry drugs GP2. Supervise the use of pesticides and fertilizers GP3. Protect farmland ecological environment GP4. Improve rural living environment GP5. Support agricultural science and technology research and development GP6. Agricultural subsidies	(Ogorevc et al., 2020)	GP
Trend	TR1. Organic food is trendy TR2. Organic food is in fashion	(Japutra et al., 2022)	TR
Expectation	EX1. If I use organic food, I will get more health benefits than traditional food EX2. If I use organic food, I feel better EX3. If I use organic food, I will have less negative impact on the environment than traditional food	(Alzahrani and Seth, 2021)	EX

Confirmation	CO1. My organic food experience was better than I expected CO2. Consumption of organic food meets my expectations	(Chen, 2012)	CO
Satisfaction	SA1. I'm interested in organic food SA2. My choice of organic food consumption is right SA3. I will recommend organic food to my family, friends	(Chen, 2012)	SA
Purchase Intention	PI1. I am willing to purchase organic foods if they are available PI2. I intend to buy organic foods if they are available PI3. I plan to consume organic foods if they are available for purchase. PI4. I try to consume organic foods if they are available for purchase.	(Jose et al., 2021)	PI

4. RESULTS AND DISCUSSION

4.1. Results

Assessment of the measurement model

First, the Outer Loading coefficient is considered to eliminate variables that do not guarantee convergence value (Hair et al., 2019). Based on Henseler et al., (2009), variables with an Outer Loading coefficient of less than 0.7 should be removed from the model as the convergence value is not guaranteed. Table 2 results show that all variables have an Outer Loading coefficient greater than or equal to 0.7. Moreover, the AVE coefficient (Table 2) is all greater than 0.5 so the scales ensure validity.

Table 2. Outer loading, Cronbach's Alpha, rho_A, Composite Reliability, AVE

To evaluate the reliability, the values Cronbach's Alpha, rho_A, Composite Reliability are used as suggested by Hair et al (2019). The results in Table 2 show that these values are in the range from 0.708 to

0.912, ensuring the reliability value proposed by Hair et al (2019). Regarding the discriminant validity, this study uses the criterion of HTMT < 0.9 as suggested by Henseler et al (2015). The results in Table 3 show that no HTMT values violate the above criteria. Therefore, discriminant validity was warranted in this study.

Structural model assessment

The R-Square coefficient shows that PI, CO, PQ, PV are explained as 71.5%, 95%, 73.1%, and 83.2%, respectively. This is a good result that the variables used explain many variations of PI, CO, PQ, PV. Next, CC, EX, PS, PR, SV are explained respectively: 66.2%, 60.9%, 41.4%, 57.1%, 24.2% respectively, indicating that the variables used explain the relative variation of the above variables.

The research team found that the impact of EX on CO, CO on SA, and SA to PI was statistically significant at 5% because of the same P-value = 0.0005. The Impact factor of EX to CO, CO to SA and SA to PI are positive indicating that this effect is a positive effect. Thus, the research team found that consumer expectations have an equal impact on consumer confirmation, thereby affecting consumer satisfaction, thus creating an equal impact on people’s intention to consume organic food.

The impact of PV and PR on EX has the same P-value as 0.0005, indicating that these effects are statistically significant. The PV-to-EX and PR-to-EX impacts are both relatively large with the Impact factor of PV-to-EX of 0.374 and the PR-to-EX of 0.401 indicating that these effects are positive effects. In fact, when consumers are aware of the values and risks that organic food consumption is good for themselves and their families, their intention to consume this food will be further enhanced.

The effects of EA, PP, PQ, and SV on PV with P-value of 0.016; 0.00; 0.002 and 0.00±0.05, respectively, suggesting that these effects are statistically significant. The Impact factor of these effects all bear a positive sign, indicating that they all act in the same direction on PV. As such, it can be confirmed that the higher the value that evokes emotions, perceived price, perceived quality and social value, the higher the consumer’s awareness of the intention to consume organic food is also increasing.

In addition, the authors’ group also found that PS and FR’s effects on PR with P-value values of 0 and 0.001±0.05, respectively, should be statistically significant. PS’s and FR’s Impact factor on PR were 0.437

and 0.254, respectively, indicating that this was a positive effect. Indeed, financial and psychological risks are two types of risks that consumers encounter when making a decision to buy a certain product, so it is reasonable that financial and psychological risks increase with the perception of people’s risks.

The impact of EB on SV has P-value=0.162>0.05, indicating that the impact is not statistically significant, or EB has no impact on SV. In contrast, the impact of HB on SV has P-value=0.000.05, indicating that the impact is statistically significant. Impact factor is 0.323, with a positive sign indicating that this is the same-dimensional effect. It can be confirmed that, when people are aware that organic food consumption has health benefits for themselves and their families, their social value will also be enhanced.

The impact of the PA on the PQ with a numerical value P-value=0,0.05, shows statistically significant. The positive and relatively large impact factor = 0.662 indicates that this is a positive effect. In fact, as consumers identify more product attributes, they increase their awareness of the quality of the product.

In addition, the impact of FN on PS has a numerical value P-value=0.000.05, indicating statistically significant. Impact factor = 0.551 has a positive and relatively large sign indicating that this is the same-dimensional effect. The research team found that consumers often experience “new type of food consumption fear syndrome” due to concerns over hygiene and food safety issues, as this “fear” increases with consumer psychological risk.

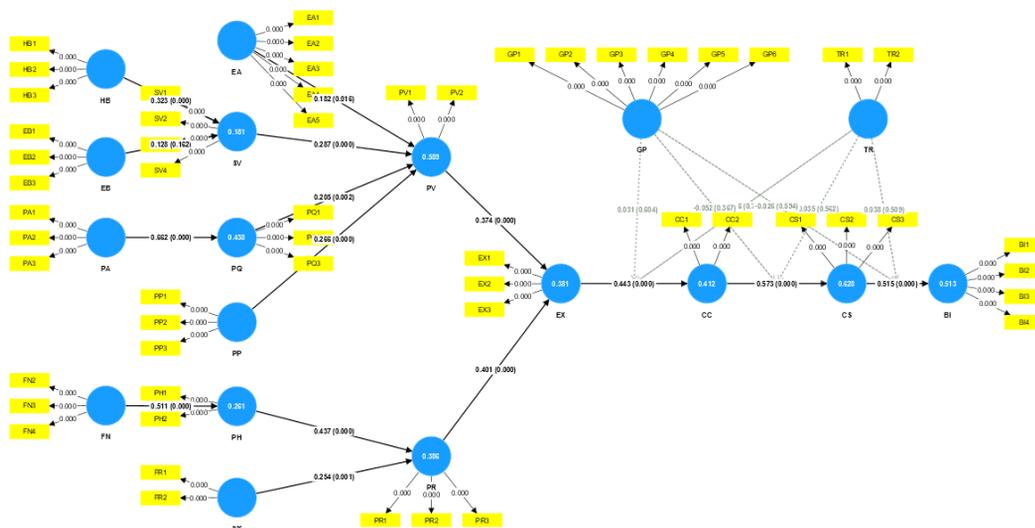

Figure 5. Model Reliability Results

On the impact of two moderating items on the purchasing behavior of organic food by consumers. The authors found that the impact of GP on PI, CO, and SA with P-value was all greater than 0.05, respectively. Therefore, it is not statistically significant. Thus, it can be argued that the Government’s Production Assistance has no regulatory role to affect consumers’ buying of organic food from expectations. In addition, the impact of TR on PI, CO, and SA respectively has a P-value of 0.003; 0.00; 0.0000.05, respectively, indicating statistically significant. Impact factor is 0.255; 0.306 and 0.289 have positive indications that this is the same-dimensional effect, respectively. In which, TR has the strongest impact on CO. It can be argued that the Trend variable plays a regulatory role in influencing consumers’ buying of organic food from expectation.

4.2. Discussion

In Vietnam, 86% of consumers give preference to organic food products for their daily meals (AC Nielsen). However, according to the results of research conducted in Vietnam, 12.6% of consumers fear

that the value that organic food brings is not worth the money they spend; nearly 17% of respondents fear feeling unsatisfied or disappointed about consuming organic food.

In recent years, the whole world tends to gradually switch to organic food consumption. The production and consumption of organic food is considered an alternative solution, optimizing the outstanding aspects left in the traditional production model. This promotes sustainable development and sustainable consumption, providing health benefits and both environmental and social values.

Besides the positive aspects that organic food brings to consumers, there are still risks of organic food hindering consumption intention in Vietnam. Organic food items are not diverse and not always available. What's more, organic food costs an average of 47% more than conventional food. However, if the quality of the product that consumers perceive is inversely proportional to the amount of money they spend to buy organic food, then this is a huge risk in the consumer's intention to buy the product again.

PV and PR are factors that directly affect the intention to consume organic food in Vietnam. Therefore, manufacturers need to conduct long-term research in order to grasp the needs of the market. The study hopes that the proposed model and theoretical basis can bring correct judgments to manufacturers.

5. CONCLUSION

5.1. Limitations in research

Based on the research and discussion of the results, the study found several limitations in the study:

Due to geographical and time factors, the study focused only on conducting surveys in specific areas. Because of this, the observation sample may not cover the factors affecting the intention to purchase organic food.

Moreover, although it may be seen that research has marked successful steps in developing a fairly detailed model of the impact of perceived value, perceived risk on intention of purchasing organic food. In fact, this cross-sectional study may have limited the ability to fully grasp the correlation of flexibility factors. At the same time, it is inevitable for the model to miss some relevant variables.

5.2. Future Research Orientation

Recognizing the above shortcomings, the study presented several suggestions for future research development as follows:

In order to bring about highly representative research results, upcoming studies can expand the size of the observational sample as well as cover the scope of the research across the country. In addition, this study was conducted in Vietnam - a developing economy. Therefore, future studies in this field can collect and survey data sets from developed countries and compare the results with current research. In another development direction, future studies may also look at similar or different contexts in other parts of the world that would increase the generalization of these findings.

In the face of constant domestic and international economic fluctuations, the development of regular and continuous research is necessary and important. Therefore, the study hopes that the above recommendations can contribute to the development of future research.

LINKING TRANSFORMATIONAL LEADERSHIP AND ORGANIZATIONAL RESILIENCE: THE MEDIATOR ROLE OF ADAPTIVE CULTURE EVIDENCE FROM PETROLEUM ORGANIZATION

Nguyen Minh Tam¹

ABSTRACT: The aim of this research is to investigate the influence of transformational leadership on organizational resilience through mediator role of adaptive culture. This study employed a survey of 200 employees working at an aviation petroleum company of Vietnam. The findings revealed that transformational leadership positively impact adaptive culture, and in turns adaptive culture affected organizational resilience. Moreover, adaptive culture mediated the relationship between transformational leadership and organizational resilience. This results provide practical implications of enhancing transformational leadership as well as adaptive culture for better organizational resilience within petroleum industry. The detailed discussion and limitations will be stated at the end of this paper.

Keywords: Transformational leadership, adaptive culture, organizational resilience, SmartPLS

1. INTRODUCTION

Organizational resilience is the key to answer why many organizations collapse during crisis while others can tackle challenges and grow more resourceful. Organizational resilience provides organizations insight on how they achieve company's goals during hardship, tension and break barriers to adapt (Vogus & Sutcliffe, 2007). Business that have strong resilience are well-prepared for worst situations as well as builds company's own standards to response with unanticipated events rapidly (Kantur & İşeri-Say, 2012). Corona pandemic has negatively affected operation of both SMEs and large firms in Vietnam, increasing risk of default in business can lead to bankruptcy (Kroeger et al., 2020). Thus, organizational resilience becomes more crucial, especially after pandemic, it proves that company with low resilience will be eliminated from market.

According to Riolli and Savicki (2003), there are two main streams that affect organizational resilience are at organizational level and individual level. At individual level, individual dispositions, skills or values can affect to organizational resilience (Riolli & Savicki, 2003). Kim (2020) proves that employees with high adaptability, and proactiveness impact positively on firm's recovery process after crisis. Proximal environmental events happening individual level such as acute stressors and chronic situational factors also associate with resilience of organization (Riolli & Savicki, 2003). At organizational level, company's structure and functions have impact on organizational resilience (Riolli & Savicki, 2003). Power distribution, normative control along with organizational culture encourages organizational resilience (Andersson et al., 2019). Moreover, extra-organizational factors such as investing in information system also influence organizational resilience (Riolli & Savicki, 2003). Besides, there is another stream to investigate organizational resilience is the way leadership affects resilience of organization in which Odeh et al. (2021) and Valero, Jung and Andrew (2015) pointed out that organizational resilience is affected positively by transformational leadership.

When investigating the relationship between transformational leadership and organizational resilience, survey is a popular method used by researchers. Valera, Jung and Andrew (2021) survey 112 organizations in Southeastern Economic Region of South Korea operating in different fields and find the positive influence of transformational leadership on organizational resilience. After conducting online survey with 379 services

¹ Banking and Finance - International School of Banking Academy - Banking Academy - Vietnam.

firm in Dubai, Odeh et al. (2021) conclude that transformational leadership does not only positively impact organizational resilience but also adaptive culture and transformational leadership, organizational resilience are partially mediated by adaptive culture. Whereas, interview method is applied to examine the way transformational leadership impacts employees that strengthen resilience in organizations. Six elements including transformational leadership are pointed to support companies adapt successfully to alteration and increase organizational resilience after interviewing with focused group of two health non-profit organizations (Witmer & Mellinger, 2016). Teo, Lee and Lim (2017) use purposive sampling from literature regarding SARS in Singapore to conduct semi structured, open ended, face-to-face interviews with 7 healthcare leaders. Teo, Lee and Lim (2017) assert that correct, timely response of leaders in relational connections among staffs and modify their psychologically, emotionally, and socially behavior can enhance resilience.

This study is different from previous researches because previous ones focused on surveying, interviewing organizations or employees from various organizations, however, this study chooses participants from one organization only to make specific recommendations. Secondly, previous studies is done during and before pandemic time so the requirement for a research about this topic in post-pandemic period is necessary because working environment in post-pandemic changes very fast with technological changes and more flexible (Mangla, 2021). Thirdly, this is also the first research investigation about this topic in Vietnam. Vietnam is a developing country with socialist-oriented market economy and Vietnam's economic development orientation is industrialisation and modernisation (Fforde, 2016). Hence, Vietnamese firms have different features comparing to foreign firms based on different market economy and business environment.

Through this research, company can understand more about organizational resilience along with its importance to firm during and after crisis. Moreover, this study also provides not only organizations in petroleum industry but also other sectors understanding about influence of transformational leadership within business on organizational resilience along with adaptive culture to make right decisions. Besides, this research contributes understanding about current resilient capability of firm and suggests recommendations on how company can enhance it through transformational leadership and adaptive culture.

This research is important to company to enhance organizational resilience for better preparation for crisis may happen in future and fasten recovery process in post-pandemic. Many restrictions are implemented to airline transport to reduce spread of virus, experiencing Covid for a long time causes severe long-term impacts on international aviation activity (Nižetić, 2020). Vietnam's aviation industry is also impacted significantly, in 2020, aviation transportation's demand decreased by 34.5 to 65.9% comparing to 2019 (Lan, 2021). Low demand results in low profit and increases pressure on business operation.

2. LITERATURE REVIEW

2.1. Transformational leadership theory

Transformational leadership theory was created by Bass and Avolio in 1994. According to Bass and Avolio (1994), transformational leadership style has four dimensions are idealized influence, inspirational motivation, intellectual stimulation and individualized consideration. Idealized influence is becoming a role model for employees and leader's behaviour is perceived by others to be consistent with ethical standards (Bass & Avolio, 1994). Inspirational motivation is motivating employees to achieve personal along with organizational objectives and making connections between organizational mission with employees' values, beliefs (Bass & Avolio, 1994). Intellectual stimulation is enhancing intelligence, rationality and innovative, creative working environment (Bass & Avolio, 1994). Individualized consideration is listening to each employee's demands, values, interests to support them on work and use these information for decision making (Bass & Avolio, 1994).

Theory of Bass and Avolio (1994) has been applied in many fields and industries. This theory was applied in investigating impact of transformational leadership on job involvement and job satisfaction among staffs in

hospitality and tourism industry (Vargas-Sevalle, Karami & Spector, 2020). Moreover, Bass and Avolio (1994) theory is used in banking sector to prove positive impact of transformational leadership on organizational efficiency (Koranteng et al., 2022). Theory of Bass and Avolio (1994) is chosen as theoretical background for this research is that it is applied in research of Valero, Jung and Andrew (2015) which investigates the impact of transformational leadership on organizational resilience. Organizational resilience can be strengthened through transformational leadership by setting common vision to tackle future disasters, disruptions and inspiring employees to work toward that vision with cooperation (Valero, Jung & Andrew, 2015).

2.2. Organizational resilience

Vogus and Sutcliffe (2007) define organizational resilience is the way organization keeps positive adjustments during challenging conditions so company can overcome more strongly and resourcefully. Suryaningtyas et al. (2019) define organizational resilience as company's capability to predict, prepare, respond and modify for changes caused by unanticipated disturbances to survive and even be more prosperous. Zehir and Narcikara (2016) define organizational resilience is capability to absorb stress and maintain operation despite of adversity as well as recover from unfortunate situations. Generally, organizational resilience is company's ability to predict, prepare and adapt with challenges to overcome them and even recover more strongly.

There are two dimensions of organizational resilience are planned which should exist in firm before crisis and adaptive which is generated after crisis (Prayag et al., 2018).

2.3. Transformational leadership

As mentioned above, Bass and Avolio (1994) concludes four characteristics to create transformational leadership are idealized influence, inspirational motivation, intellectual stimulation and individualized consideration. Besides, there are some other traits of transformational leadership defined by other researchers. Omar (2017) states that transformational leaders have idealized influence, use inspirational motivation and intellectual stimulation towards organizational philosophy, success stories and enhance quality management. According to Rafferty and Griffin (2004) there are three main elements of transformational leadership. Vision is inspiring employees to work hard through difficulties to achieve future success (Rafferty & Griffin, 2004). Intellectual stimulation is igniting employees to create many problem-solving solutions, raising their awareness of challenges and improving their ability to think old issues in new way (Rafferty & Griffin, 2004). Inspirational motivation is visualizing good future, guiding employees how to achieve it, setting a role model and high performance standards and showing high determination, confidence (Rafferty & Griffin, 2004).

2.4. Adaptive culture

Costanza et al. (2015) defines adaptive culture as which allows as well as encourages risk taking, trust and has common believe in problem solving, opens to innovation. Odeh et al. (2021) defines adaptive culture as organizations that have culture with strong ability to adapt with change. Huynh and Luu (2021) finds out that organization with adaptive culture always supports employees to initiate change in culture to suit with environmental requirements and make ability for continuous innovation.

2.5. Hypothesis development and research model

Bass and Avolio (1993) find the close relationship between organizational culture and transformational leadership, many corporations have transformed their cultures based on four characteristics of transformational leadership stated in theory of Bass and Avolio (1994). In changing business environment, high adaptive culture assists organization in dealing with changes, adapting with new environment leading to higher potential to

survive (Costanza et al., 2015) and transformational leadership plays a crucial role in shaping the adaptive culture in organization (Xenikou & Simosi, 2006). Odeh et al. (2021) concludes that leaders who have vision, intellectual stimulation and inspirational motivation create strong impact on adaptive culture. Based on above analysis, I hypothesize that:

Hypothesis 1. Transformational leadership has positive influence on adaptive culture.

Boin et al. (2013) proves that in crisis period, traits of transformational leaders are important to strengthen resilience because leaders should generate sense of things should be done for staff, communicate messages, identify responsibilities and enhance learning from experiences. Organizational resilience and organizational resources are positively impacted by transformational leadership along with employee self-efficacy (Wang, Zhao & Zhang, 2022). Six elements consisting of transformational leadership are found to encourage companies adapt successfully to changes and increase organizational resilience (Witmer & Mellinger, 2016). Besides, Valera, Jung and Andrew (2021) indicates that transformational leadership associated positively with resilience of firms. Based on above analysis, I hypothesize that:

Hypothesis 2. Transformational leadership positively affects organizational resilience.

Adaptive culture along with resilient leadership play a mediate role in organizational performance and resilience (Suryaningtyas et al., 2019). In organization with adaptive culture that leaders view crisis in opportunistic view point is important element in deciding resilient of organization (McManus et al., 2008). Costanza et al. (2015) considers adaptive organizational culture as culture that allows employees to take risk, have common believe in problem solving and open to innovation which is crucial to adapt and be ready to change to respond, overcome crisis as well as enhance resilience. Based on above analysis, I hypothesize that:

Hypothesis 3. Organizational resilience is impacted positively by adaptive culture.

There is little research on the mediating role of adaptive culture on relationship of organizational resilience and transformational leadership. However, some empirical evidence showing the mediating effect of organizational culture on relationship of organizational performance and transformational leadership were published (Elshanti, 2017). Xenikou and Simosi (2006) states that organizational culture mediates the relation between transformational leadership style and performance. Transformational leadership and organizational resilience relationship are mediated by adaptive culture (Odeh et al., 2021). Based on above analysis, I hypothesize that:

Hypothesis 4. Adaptive culture mediates relationship of organizational resilience and transformational leadership.

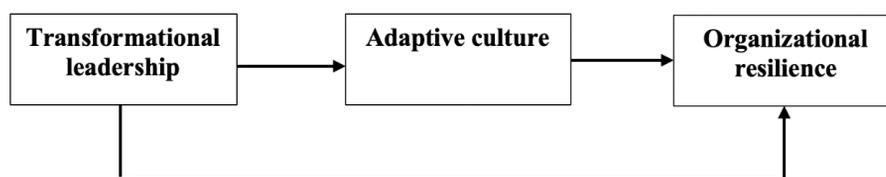

Figure 1: Research model

3. RESEARCH METHODOLOGY

3.1. Sample

Non-probability sampling method which is choosing units from a sample in a non-random way (Berndt, 2020) was used in this research. Specifically, snowball sampling technique was applied because

I only know some people in surveyed company while I needed to collect 200 responses from company’s employees so I sent survey to Mrs. Thu who is employee of company and asked her to forward the survey to other colleagues to gather enough data.

Sample size for the research was 200 which is taken from population of 1300. This is because in regression analysis, the sample size should be 100 or larger to analyze (Hair et al., 2010) so that the investigation of a part of population can represent results of a whole group as well as collect much responses to survey objectively. Moreover, the sample size must have minimum of 5:1 ratio with variables to reduce problems of overfitting data so the higher the ratio, the more researchers prefer (Hair et al., 2010).

Table 1: Demographic description of research’s participants

No.	Variables	Frequency	Percentage
1	Sex		
	Male	72	36%
	Female	128	64%
2	Working seniority		
	Under 5 years	84	42%
	5 – 10 years	59	29.5%
	10 – 15 years	28	14%
	Over 15 years	29	14.5%
3	Position		
	Employee	146	73%
	First line manager	37	18.5%
	Middle manager	15	7.5%
	Top manager	2	1%

After three weeks of collecting answers, demographic description of 200 participants was summarized in Table 1. From Table 1, it can be seen that this study was dominated by female with smaller than 5 years of working seniority in employee position. Female accounted for 64% of participants and the others were male. With working seniority, most of respondents were working under 5 years corresponding to 42% while 29.5% of respondents were who have worked in company from 5 to 10 years. With 10 – 15 years and over 15 years of seniority, proportion of respondents were 14% and 14.5% respectively. For position variable, the higher the job position, the smaller the number of respondents. Employees made up the largest percentage with 73% of participants while first line manager, middle manager and top manager only accounted for 18.5%, 7.5% and 1% only.

3.2. Measure

Transformational leadership is defined to have three main characteristics are vision, intellectual stimulation and inspirational motivation (Rafferty & Griffin, 2004). Items of Rafferty and Griffin (2004) was adopted because in research of Odeh et al. (2021), the researchers used these items to measure transformational leadership variable successfully. Vision was measured by three items are my leadership understands clearly about where we are going, my leadership knows what our team will be in 5 years, my leadership does not know about where company is going (Rafferty & Griffin, 2004). Inspirational motivation was measured by three items are my leadership makes staffs feel proud as part of company

through his/her words, my leadership tells about positive working unit, my leadership inspires employees to think environment shifts as opportunities (Rafferty & Griffin, 2004). Intellectual stimulation was measured by three items are my leadership pushes employees to look at old issues in innovative ways, my leadership has concepts forcing employees to reconsider about things that I never questioned, my leadership pushed employees to reconsider their basic assumptions of job opportunities (Rafferty & Griffin, 2004).

Items of Costanza et al. (2015) was adopted because in research of Odeh et al. (2021), the researchers used these items to measure adaptive culture variable successfully. Adaptive culture was measured by eight items adopted by Costanza et al. (2015) were obtaining fresh point of view to recognize and understand issue; predict new product has huge market demand; devoted to upgrading present products, including successful products, as well as creating new products; believe in the infinite of organizational future; to tackle future requirements, provide training or apprenticeship program to train workers about new, essential skills; do intra-organizational investigations to identify the way to create different product with industry; performing new work process in company's budget and ahead of time; collaborating with outside parties to implement policies which is beneficial for company in long-term.

Ten items adopted by Prayag et al. (2018) were used to measure two reflective variables of organizational resilience are planned and adaptive. Items of Prayag et al. (2018) was adopted because in research of Odeh et al. (2021), the researchers used these items to measure organizational resilience variable successfully. Planned resilience was measured by five items are given how much others depend on us, how we prepare for the unanticipated is proper; to make sure that plans for emergency is efficient, company is committed to practicing utilizing and testing them; we focus on being capable of responding to the unanticipated; we set up specific priorities for things that are essential during and after crisis; we track the industry proactively to get early alert of emerging problems (Prayag et al., 2018). Adaptive resilience was measured by five items are my company has adequate resources to deal with sudden change; in case key personnel fail to appear, company always has others to fill in their role; in case company suffered crisis, our company would have good leadership within business; we are known for capability of innovative use of knowledge; we are able to make difficult decisions immediately (Prayag et al., 2018).

3.3. Data collection and analysis

I contacted with Mrs. Thai Thi Minh Thu who is employee of company that was selected to survey. When collecting data, I designed survey on Google Form and sent the form to Mrs. Thai Thi Minh Thu through her mail. In order to make sure the link worked effectively and participants could understand the survey, I conducted pilot test with Mrs. Thu and 10 colleagues of her. Mrs. Thu. After that, I asked Mrs. Thu to forward my official survey link to other colleagues in north offices of company. Recruitment process only ended when there were no additional cases to reach and responses is collected adequately. In order to collect 200 valid responses, I sent the survey to 300 people with response rate is 66.7%. The error rate of responses was 0 because I set all requirements in Google Form to make sure that participants would answer all questions and choose only one option for each statement before submit.

PLS-SEM (partial least squares structural equation modeling) was employed to test the research model of this study. After analyzing diverse tools to analyze data, PLS-SEM was considered as the most suitable one because it is appropriate for small sample size (Hair et al., 2017) and it is also fit in exploratory research (Peng & Lai, 2012) like this study. Specifically, SmartPLS version 4 software was used to assess constructs' validity as well as reliability to test stated hypotheses.

Analysis of this model was done through some values such as outer loading - estimate the relationship in reflective measurement model; cronbach’s alpha – measurement of internal consistency of items (Nunnally & Beinstein, 1994); composite reliability – assessing internal consistency of reliability (Hair et al., 2014); HTMT – evaluation of discriminant validity (Hair, Ringle & Sarstedt, 2011); R square – indicating the explanatory power of endogenous variable by exogenous variables if $R^2 < 0.25$ is very weak, $0.25 \leq R^2 < 0.50$ is weak, $0.50 \leq R^2 < 0.75$ is moderate, $R^2 \geq 0.75$ is substantial (Hair, Ringle & Sarstedt, 2011); path coefficient – measurement of variables’ reliability and look for collinearity and VIF is expected to be less than 5 for absence of common method bias (Ringle, Da Silva & Bido, 2015).

This research model consisted of mediating variable was adaptive culture so to test direct and indirect effects, SmartPLS is the most effective software. I performed 1000 subsamples’ bootstrapping procedure with significance level was 0.05. If P values < 0.05 , indirect effect is significant and vice versa (Hair et al., 2011).

4. RESULTS

4.1. Measurement model results

4.1.1. Evaluation of reliability

Table 2: Outer loadings

	AC	ORAR	ORPR	TLIM	TLIS	TLV
AC1	0.843					
AC2	0.846					
AC3	0.889					
AC4	0.711					
AC5	0.525					
AC6	0.837					
AC7	0.844					
AC8	0.308					
ORAR1		0.847				
ORAR2		0.828				
ORAR3		0.899				
ORAR4		0.887				
ORAR5		0.862				
ORPR1			0.835			
ORPR2			0.877			
ORPR3			0.892			
ORPR4			0.870			
ORPR5			0.905			
TLIM1				0.879		
TLIM2				0.913		
TLIM3				0.865		

TLIS1					0.901	
TLIS2					0.939	
TLIS3					0.937	
TLV1						0.887
TLV2						0.924
TLV3						-0.232

Hair et al. (2017), outer loading is used to estimate the relationship in reflective measurement model. If outer loading value is less than 0.708, it reflects that observable variables may not be reliable to measure latent variables and it should be considered to remove that item (Hair et al., 2017). Based on Table 2, it can be seen that outer loadings of AC5, AC8 and TLV3 are smaller than threshold 0.708 so these three items were removed from the model.

Table 3: Cronbach’s alpha and composite reliability

	Cronbach’s alpha	Composite reliability
AC	0.909	0.930
ORAR	0.918	0.937
ORPR	0.924	0.943
TLIM	0.863	0.916
TLIS	0.917	0.947
TLV	0.783	0.901

Cronbach’s alpha is expected to range from 0.7 to 0.95 because between this range, internal reliability construct is achieved (Nunnally & Beinstein, 1994). After removing items AC5, AC8, TLV3 from model, it is seen from Table 3 that Cronbach’s alpha values indicate achievable internal reliability construct of this model.

Composite reliability also estimates internal reliability construct of model and composite reliability is preferred to be higher than 0.7 (Hair et al., 2014). Based on Table 3, results of composite reliability are higher than 0.7 and lower than 0.95 reflects good indicator for construct reliability.

4.1.2. Evaluation of validity

Table 4: Average variance extracted (AVE)

	AVE
AC	0.689
ORAR	0.748
ORPR	0.767
TLIM	0.785
TLIS	0.857
TLV	0.820

AVE illustrates that on average, more than half of the variance of its indicators can be explained by construct when AVE is higher than 0.5 and this result is desirable because it has convergent validity (Hair, Ringle & Sarstedt, 2011). Hence, from Table 4, AVE results of this model is acceptable.

Table 5: HTMT criterion results

	Heterotrait-monotrait ratio (HTMT)
ORAR <-> AC	0.447
ORPR <-> AC	0.553
ORPR <-> ORAR	0.326
TLIM <-> AC	0.718
TLIM <-> ORAR	0.513
TLIM <-> ORPR	0.554
TLIS <-> AC	0.647
TLIS <-> ORAR	0.346
TLIS <-> ORPR	0.411
TLIS <-> TLIM	0.705
TLV <-> AC	0.710
TLV <-> ORAR	0.440
TLV <-> ORPR	0.541
TLV <-> TLIM	0.699
TLV <-> TLIS	0.571

In order to examine the discriminant validity, HTMT results is used. HTMT indicator is expected to be lower than 0.9 because if it is higher, collinearity problem such as multicollinearity is existed among latent constructs and most of items of constructs estimates identical things (Hair, Ringle & Sarstedt, 2011). According to Table 5, it can be seen that HTMT results of the model reflect good discriminant validity.

4.2. Structural model results

Variance inflation factor (VIF) coefficient of inner model ranges from 1.561 to 2.159 indicates that there is no collinearity issue in the construct. If VIF is higher than 4, there will be a sign of multicollinearity (Ringle, Da Silva & Bido, 2015).

Table 6: Path coefficients, f-square and R-square results

	Path coefficients	f-square
AC -> ORAR	0.449	0.353
AC -> ORPR	0.515	0.360
TLIM -> AC	0.300	0.170
TLIS -> AC	0.260	0.164
TLV -> AC	0.307	0.159
TLIM -> ORAR	0.361	0.089
TLIS -> ORAR	0.202	0.047
TLV -> ORAR	0.281	0.038
TLIM -> ORPR	0.313	0.071
TLIS -> ORPR	0.157	0.062

TLV -> ORPR	0.260	0.069
R square: AC = 0.535 ORAR = 0.751 ORPR = 0.761		

R square reflects model’s predictive accuracy (Hair, Ringle & Sarstedt, 2011). From Table 6, 53.5% of adaptive culture is explained by transformational leadership which is a moderate level. While organizational resilience is explained by adaptive culture from 75.1% to 76.1% which is a substantial level.

Path coefficients fluctuates around +1 illustrates positive relationship of independent variables on dependent variables while path coefficients is closer to -1, it means that independent variables negatively affect dependent variables (Hair, Ringle & Sarstedt, 2011). Based on Table 6, it can be seen that transformational leadership has positive impact on adaptive culture. Besides, transformational leadership also positively affects organizational resilience. Meanwhile, adaptive culture also influences positively on organizational resilience.

Effect size f-square estimates the efficiency of independent variables on dependent variables (Cohen, 2013). If f-square < 0.2 is no effect, 0.2 ≤ f-square < 0.15 is weak effect, 0.15 ≤ f-square < 0.35 is moderate effect, f-square ≥ 0.35 is strong effect (Cohen, 2013). From Table 6, adaptive culture has strong impact on organizational resilience while transformational leadership has moderate impact on adaptive culture. Unexpectedly, the effect of transformational leadership on organizational resilience is weak.

4.3. Direct and indirect effects results

Table 7: Direct and indirect relationships value

Hypotheses	Relationship	P values	BCa CI 2.5%	BCa CI 97.5%
Hypothesis 3	AC -> ORAR	0.000	0.315	0.570
Hypothesis 3	AC -> ORPR	0.000	0.341	0.651
Hypothesis 1	TLIM -> AC	0.000	0.149	0.432
Hypothesis 1	TLIS -> AC	0.000	0.132	0.414
Hypothesis 1	TLV -> AC	0.000	0.195	0.427
Hypothesis 2	TLIM -> ORAR	0.001	0.055	0.220
Hypothesis 2	TLIM -> ORPR	0.001	0.068	0.247
Hypothesis 2	TLIS -> ORAR	0.001	0.053	0.195
Hypothesis 2	TLIS -> ORPR	0.002	0.063	0.227
Hypothesis 2	TLV -> ORAR	0.000	0.074	0.218
Hypothesis 2	TLV -> ORPR	0.000	0.086	0.245
Hypothesis 4	TLIS -> AC -> ORAR	0.001	0.053	0.195
Hypothesis 4	TLIS -> AC -> ORPR	0.002	0.063	0.227
Hypothesis 4	TLIM -> AC -> ORAR	0.001	0.055	0.220
Hypothesis 4	TLIM -> AC -> ORPR	0.001	0.068	0.247

Hypothesis 4	TLV -> AC -> ORPR	0.000	0.086	0.245
Hypothesis 4	TLV -> AC -> ORAR	0.000	0.074	0.218

According to Table 7, BCa CI 2.5% and 97.5% shows significance of the structural paths associated with hypotheses based on a 5% significance level. If P values < 0.05, indirect effect is significant (Hair et al., 2011). From P values of indirect relationship in Table 8, it can be concluded that adaptive culture plays mediator role in linking transformational leadership and organizational resilience. Especially, P values of both direct and indirect relationships is lower than 0.005 indicating that all proposed hypothesis 1, hypothesis 2, hypothesis 3, hypothesis 4 of this research are supported.

5. DISCUSSION AND LIMITATIONS

5.1. Discussion

The positive influence of transformational leadership on adaptive culture is supported. Based on aforementioned findings, it is concluded that transformational leadership impacts positively on adaptive culture in which inspirational motivation affects adaptive culture the most. Other researches of Odeh et al. (2021), Xenikou and Simosi (2006), Block (2003) found the same findings. Based on transformational leadership theory of Bass and Avolio (1994), three characteristics of transformational leaders are asserted to advance the tendency to considering risks as opportunities to learn, adapt and restructure organizational ability to fit in different organizational situations (Teece, 2016). Akkaya (2020) states that transformational leaders can create adaptive internal environment where employees has transformational role models to encourage and motivate them to be nippy and innovative. Even though transformational leadership results in positive effect on adaptive culture, the impact within company is quite moderate which is dissimilar with significant impact of Odeh et al. (2021) due to differences in research context and sectors. Aviation petroleum company belongs to Ministry of Transport (Skypec, 2019) so operation of company still has to follows and depends on the direction of Ministry and Government. As a result, leaders of company are not the one who can totally control company and influence organizational culture.

The positive effect of transformational leadership on organizational resilience is supported. The results indicate that transformational leadership impacts positively affects organizational resilience. Identical findings are supported by Boin, Kuipers and Overdijk (2013), Wang, Zhao and Zhang (2022), Suryaningtyas et al. (2019). Transformational leaders have focused vision, individual values and motivational behaviour to create positive emotions, self-esteem and increase capability, belief in company to overcome crisis (Brockner & James, 2008). Transformational leadership has characteristics to improve employees' enthusiasm to complete work successfully even in bad turbulent circumstances (Bass, 1985) and make employees dedicate to work and increase organization's survival (Ostroff, Kinicki & Muhammad, 2013). Nevertheless, the impact of transformational leadership on resilience of company is weak which is different from results of Valera, Jung and Andrew (2021) showing the strong influence. The cause of difference is because different of research time scope and sample, the previous study have sample from various companies in different industries.

Positive influence of adaptive culture on organizational resilience is supported. The findings illustrate that adaptive culture impacts positively and significantly on organizational resilience. This result is identical with earlier results of Costanza et al. (2015), Barasa, Mbau, and Gilson (2018) and Southwick et al. (2017). Odeh et al. (2021) pointed out that during normal or crisis period, adaptive culture improves decision making process and level of flexibility along with creativity of business. Adaptive culture creates conditions

for the development of adaptive quality and proactive response in uncertainty situation (McManus et al., 2018) and it increases positive behaviours for employees to make them consider difficulties as opportunity to develop and grow (Odeh et al., 2021). Specifically, the results reflect that although adaptive culture impacts strongly on both planned and adapted resilience, planned resilience is affected stronger. Weick and Sutcliffe (2007) stated adverse findings indicating that planning for threats will limit company from tackling with exceptional challenges. However, results of this study has denied previous findings and planning for organizational resilience in crisis is a requirement for all company including surveyed organization and that is why company can overcome Covid-19 pandemic as well as maintain normal operation.

The mediator role of adaptive culture is supported in the results of this research. The results indicate that adaptive culture mediates the relationship of transformational leadership and organizational resilience. As mentioned above, the positive direct effect of transformational leadership on organizational resilience is weak. As a result, it reflects the crucial role of adaptive culture as a mediator because only when transformational leadership creates and supports the development of adaptive culture in business, then it will enhance organizational resilience. This findings are in alignment with previous results showing mediator role of adaptive culture in the link between transformational leadership and organizational resilience of Odeh et al. (2021), Verdu-Jover, Alos-Simo and Gomez-Gras (2018) and Elshanti (2017).

5.2. Theoretical implications

The research questions that were raised to investigate within this study is built on existing theory of transformational leadership along with adaptive culture and organizational resilience. The findings of this study contributes to understanding of positive relationship between transformational leadership and organizational resilience through mediator effect of adaptive culture. It extends knowledge boundary related to the theory in new context which is company in north side of Viet Nam in post-pandemic period. Therefore, it will be helpful and attractive for academics and researchers interested in these topics. Although this research was conducted in a developing country in Southeast Asia, the results were supported by earlier researches with not much unexpected results. Additionally, this research employed quantitative method with expectation to provide more practical evidence than qualitative and case study method utilized in researching organizational resilience (Costanza et al., 2015) with hope to bridge the previous research gaps.

5.3. Practical implications

Based on stated findings and discussion, it provides for managers and leaders in petroleum organizations huge implications especially for further crisis like Covid-19 in the future. The results of this study indicates that transformational leadership has positive impacts on organizational resilience by nurturing adaptive culture, especially inspirational motivation with reasonable support through discussion is asserted to have stronger effect than other outcome variables. Thus, leaders should focus on advancing inspirational motivation trait to increase adaptive culture resulting in higher resilience of firm. However, the impact of transformational leadership on resilience is weak which means that transformational leadership style affects positively on resilience of company but it may not the leadership style that is the best for resilience of company. As a result, the mediator role of adaptive culture is important, only when transformational leadership creates and supports the development of adaptive culture in business, then it will enhance organizational resilience. Adaptive culture has a significant role in increasing resilience capacity of firm so practitioners and leaders can make use of this variable to increase organizational survival potentials. Leaders can extend knowledge on how adaptive culture is nurtured and navigates uncertainties for preparation and adaption with changes.

5.4. Limitations

Although this study provides considerable theoretical and practical contributions, it remains some limitations. Due to the fact that the time to complete this project is short so data was collected within only one month so it may not reflect the situation of surveyed company in a long-term situation but only for period of the research.

Additionally, the sample size of this research is small and only focus on north side of Vietnam so the sample is not diverse and the findings cannot reflect the different in perspectives and responses of participants from different sides. According to Table 1, most of participants were female so there will be different in personalities, point of views between male and female (Wille, 2018) so further research requires the equality in the number of male and female participants. As mentioned above, 300 surveys had been sent while this study only needed 200 responses because snowball technique has disadvantage in reaching participants due to researcher cannot contact directly with participants rather using assist of others (Berndt, 2020).

6. CONCLUSION

This research has fully answered all the research questions as well as achieved research aim and objectives. The study investigated hypotheses of relationships between transformational leadership, adaptive culture and organizational resilience by using quantitative research method and employing survey based on pre-validated measures to make better understanding in post-pandemic period. Proposed hypotheses were supported by results of the study: transformational leadership has positive influence on adaptive culture, transformational leadership positively affects organizational resilience, organizational resilience is impacted positively by adaptive culture and adaptive culture mediates relationship of organizational resilience and transformational leadership. These results contribute to understanding of academia and practitioners on the effect of transformational leadership on organizational resilience through the mediator role of adaptive culture to survive during hard time and recover after crisis.

THE FACTORS IMPACT THE REVISIT INTENTION TO DA NANG DESTINATION OF GEN Z: THE CASE OF DOMESTIC TOURISTS

Author: Phan Thi Ngoc Anh¹

Mentor: Pham Tien Manh

ABSTRACT: *The purpose of the research is to discover the factors influencing the revisit intention of gen Z tourists to Da Nang city. From this perspective, Da Nang images will be encouraged to customers' perceptions of future returns, improving Da Nang's tourism sector. A clustering questionnaire was used to gather information from 170 gen Z respondents. The association between variables was examined using partial least squares modeling (PLS), a method of structural equation modeling (SEM). The result indicates the push and pull motivations of gen Z when travel to Da Nang. Lastly, destination marketing also significantly mediates the city's image and revisit intention. The results demonstrates that destination images have a significant impact on tourists' intentions to return.*

Keywords: *destination image's components; revisit intention; gen Z; Da Nang city; travel motivation; destination marketing*

1. INTRODUCTION

The tourism industry plays a crucial role in Vietnam's GDP, contributing to 584.884 billion VND (13.9%) (MOF, 2021). However, the Covid-19 pandemic negatively impacted travel and tourism, preventing both domestic and foreign tourists from travelling as a consequence of social distance measures during the outbreak (Le, 2021). This led to the closure of tourism-related businesses, causing 90% of employees in Hanoi to quit their jobs and 90% of businesses in Da Nang to close. The pandemic has forced many businesses to shut down, affecting the overall economy and the growth of related industries (Le, 2020).

Given these details, numerous academic studies have emphasized the impact of the Covid epidemic on the tourism sector and covered the post-Covid tourism recovery in Vietnam. However, the majority of these studies are directed either towards domestic tourists or generic study topics (the national tourism business). As a result, this study paper will pay close attention to how domestic tourists, or gen Z, perceive the tourism business in Da Nang. From there, it may learn more about the travel intentions and behaviors of young Vietnamese people while also coming up with solutions to encourage repeat visitors to Da Nang.

The study investigates the impact of destination images on customer satisfaction and revisit intention in Da Nang. It explores push and pull motivations and aims to analyze the consistency between perceived and projected images. The study also examines the advantages of destination marketing in image congruence and revisit intention. The ultimate goal is to make recommendations for boosting tourism in Da Nang during the post-"new normal" era. To clarify the objective of the research, this paper will specifically answer the following research question:

Firstly, which factors influence revisit intention in the context of Vietnamese Gen Z domestic travel?

Secondly, how are visitors motivated intrinsically and extrinsically to revisit Da Nang by push and pull factors?

¹ Banking Academy.

Thirdly, how is the perceived image congruent with the projected image to build the destination brand in visitor perception?

Lastly, how does destination marketing convey the project image to stimulate revisit intention of customers?

2. Theoretical framework

2.1. Destination Image Classifications

In some researchs, Destination images was classified into two dimensions: perceptual and cognitive (Lin and Hsu, 2015; Stylos *et al.*, 2016), which evaluates the physical features of environments and attractiveness that motivate tourists to visit the destination (Govers, Go and Kumar, 2007), and secondly is affective image, which encompasses feelings and emotions raised towards and by the destination (Stylos *et al.*, 2016).

Other studies have categorized destination pictures using the hierarchy of effects models, which are composed of various cognitive, affective, and conative components that positively influence consumer satisfaction and revisit intention (Tran, Nguyen and Tran, 2021). The cognitive picture is explicitly conveyed through the sum of beliefs and knowledge, indicating evaluations of the perceived features of the destination, in accordance with Martín and Rodríguez del Bosque, 2008; Stylos *et al.*, 2017). According to (Hallmann, Zehrer and Müller, 2015), The affective component of destination image refers to an individual's emotional responses or assessments, which being expressed towards the destination. Before making travel plans, travelers develop a favorable affective image of the place when emotions are in alignment with goals and anticipated outcomes (Tran, Nguyen and Tran, 2021). Despite the fact that many experts believe that conative destination image is synonymous with intention, it explains how and why the feelings of first-time or returning visitors affect the decision to visit a particular destination (Pike & Ryan, 2004; Tasci *et al.*, 2007).

2.2. Motivation theory in tourism field

Motivation is the term used to describe the factors that influence people's behavior (Solomon *et al.*, 2019). From a psychological perspective, motivation happens when a client wants to satisfy what they want. This desire can be utilitarian (wanting to achieve a functional or practical benefit) or hedonistic (wanting to experience emotional responses and fantasies) (Lopes, 2011). In tourism studies, scholars agreed that motivation was the main factor in interpreting an individual's behaviour, especially in image formation and decision-making processes (Lopes, 2011; Khuong and Ha, 2014).

An extension of utilitarian needs in the tourism context have argued that a tourist's motivation is driven by 2 forces: push factors (an internal motivation) and pull factors (an external motivation) (Rashid and Patwar, 2016). Crompton proposed seven-psychological motives of push factors, including escape, self-explanatory, relaxation, prestige, social interaction, and skin-ship enhancement (Crompton, 1979). By utilizing an integrated approach, Yoon and Uysal aimed to increase the theoretical and empirical data about the relationship between push and pull motives, satisfaction, and destination loyalty (Yoon and Uysal, 2005). This paper found that tourists to Northern Cyprus were more inclined to destination loyalty if it satisfied their internal (push) motivation; and pull motivation was only significant in predicting tourist satisfaction. In later research, Mai and Huynh re-validated push motivation's role in influencing revisit intention in the context of Ho Chi Minh City (Khuong and Ha, 2014). It's interesting to note that the report builds on earlier research by asserting through empirical evidence that the pull element had a greater impact on revisit intention than the push factor. According to these findings, it is necessary to link push and pull

aspects in promotional materials for certain audiences and to modify marketing strategies to support revisit intention (Khuong and Ha, 2014).

2.2.1. Motivation to travel among gen Z Vietnam

Vietnamese travelers are driven by both external and internal motivations when making travel decisions considering shopping, novelty-seeking, and relaxation as core motivations (Khuong and Ha, 2014; Thammadee, 2015; Ha *et al.*, 2020). To analyze the connection between travel motivation and revisit intention among Generation Z, four push motivation components were chosen: Escape/Relax, Relationship, Nature, and Stimulation (Nguyen, 2014). According to research of Ha *et al.*, tourists visiting Ba Ria Vung Tau are highly inclined to return to enjoy nature and bond with family and friends (2020). Additionally, research by Airbnb found that booking for adventure travel – Stimulation among gen Z globally has increased drastically (190%) (*What's Next in Travel: The Rise of Gen Z, Adventures and Conscious Dining*, 2020), with the need to explore the unknown, feeling excitement and having adventurous experiences (Pearce and Lee, 2005). Two elements of pull motivation were considered in this context: Accessibility and the natural environment and man-made attractions (Preko, Doe and Dadzie, 2019). By incorporating results from Truong and, it is expected that accessibility and attributes are significant factors that pull gen Z to visit and revisit Da Nang (Nguyen, 2014; Truong, 2019).

2.3 Destination Branding

2.3.1. Concept of destination branding

According to Professor John Urry's theory in 2003: *Pushing Tourism to the Boundaries*, a destination brand can be thought of as a "collective hallucination" (Pike, 2012, p.6). Indeed, destinations are more complicated than goods and services, leading to a more multi-dimensional destination branding concept (Pike, 2005) that comprises both tangible and intangible components (Salehzadeh, Khazaei Pool and Soleimani, 2016). Blain and friends viewed branding concepts from the organization's point of view and viewed the concept of destination image, adopting the stance that the brand should influence the tourists' choice of destinations (Blain, Levy and Ritchie, 2005). In this study, it adopt Aaker's conceptualization of branding, comprising brand identity (brand's perspective) and brand image (tourist's perspective) (Pike *et al.*, 2010; Pike, 2012).

2.3.2.1. Brand identity as projected image

Brand identity plays a key role in formulating decision making powers of tourism managers and internal stakeholders which is created by DMOs and reflects the contribution of all brand elements to image and awareness (Govers, Go and Kumar, 2007); which provides a direction and meaning to the destination brand and its strategic vision (Tsaur, Yen and Yan, 2016). Scholars referred to brand identity as projected image (Govers, Go and Kumar, 2007; Pike, 2012). Brand identity can be reflected as an induced image in travel experience as discussed in earlier sections, more specifically, a set of secondary images in their perception (Duan *et al.*, 2020). As such, the impact of projected destination image on DI can positively differentiate a destination from the others in the tourist decision making process. According to Picazo and Moreno-gill, visual content is a crucial element for creating a positive first impression since it makes individuals simpler to recognize than written content (Picazo and Moreno-Gil, 2019). Destinations "produce promotional materials to promote, reaffirm, or advocate the decision to attract visitors" about the perceptions of the destination as a valuable asset for a place (Duan *et al.*, 2020a, p.8). Due to the prevalence of the Internet and social media in pre- and post-trip preparation, the consumption of visual content and images is emerging as the new paradigm in tourist communication (Pabel and Prideaux, 2016).

Danang’s projected image:

Da Nang city is famous for long historical development with political incidents, however, it is considered a young city (Truong, 2019) - city with nature characteristic and human touch, catering to Gen Z lifestyle. In fact, Gen Z values sustainable tourism and gives it a lot of attention, while also protecting the natural world’s beauty and seeking out the most novel and intriguing experiences in every place they visit (*Gen Z đi du lịch khác gì so với thế hệ còn lại (Phần 1)*, 2022). To position itself as a fantastic and dynamic city towards tourists and visitors, Da Nang was proposed to be a “Fantasticity” since 2014, hence, all future Danang tourist advertisements and communications are based on this slogan (Thien, 2022). In fact, Danang’s values include freshness and proximity to nature, its golden beach, its distinctive and contemporary bridges that signify its rapid growth, its young vigor and strong drive to rise, and, most importantly, its people’s warmth and friendliness with smiles on their faces. Additionally, it is important to recognise that Danang’s environmental orientation is one of the most important components that make up Danang’s identity. This side of identity has been agreed between internal stakeholders, with a high agreement in relics and landscapes as the most prominent identity of the city (Truong, 2019).

2.3.2.2. Brand image as perceived image

The phrase “brand image” relates to the actual perception that a traveler has of a particular location. Kim and Lehto (2013) examined brand image as the result of gathering data from both direct and indirect experiences at the destination. Since perception is the process by which a person selects, arranges, and interprets a variety of inputs (sights, sounds, color, etc.) to create a meaningful and cohesive picture of a location (Solomon et al., 2020a), perceived image presents a much more complex and comprehensive image after visiting a destination, which aids them in making decisions on whether they will revisit the destination. Motivation and experience significantly impact a tourist’s perceived image, which predicts their behavior, satisfaction, and decision-making (Marine-Roig and Clavé, 2016). In Danang context, a city known for its luxurious destinations, beaches, tropical sun, friendliness, youth, and quality infrastructure, is considered a desirable destination.

2.4. Destination marketing

Destination marketing aims to influence potential travelers’ decisions about their travels, with images playing a crucial role. Hence, tourism marketers aim to create, enhance, and overrate the image of the destination, as it significantly affects how people perceive tourism products (Chi & Qu, 2008). The reputation of a destination significantly impacts a destination brand’s success, as a result, it is clear that image issues are directly related to issues with tourism marketing and have a significant impact on a destination’s capacity to draw tourists (Tasci and Gartner, 2007).

2.5. Relationship and hypothesis development

2.5.1. The relationship of DI and Revisit Intention

Revisit intention is defined as the likelihood of tourists returning to a place of destination at a later time by Gitelson and Crompton (Gitelson and Crompton, 1984), and is a type of post-consumer behavior (Hallak, Assaker and El-Haddad, 2018) that is described as an increase in consumers’ pleasure. Also, expressing a want to return is demonstrated by a readiness to suggest a place to family and other similar social groups (Tran, Nguyen and Tran, 2021). Many studies have been conducted using revisit intention as a dependent variable, and it has been discovered that perceptions of values, service quality, perceived risk, subjective norms, and destination perception significantly influence tourists’ attitudes and probability to travel there

(Abbasi et al., 2021). In revisit intention, service's quality, satisfaction, destination image and perceived values are deemed as prime predictors that significantly impact tourist behaviour (Chen and Tsai, 2007; Assaker, Vinzi and O'Connor, 2011).

Stylos also offered a conceptual model of DI as a predictor of intention to revisit, with a focus in investigating the complicated link between destination image components and behavioural intents (Stylos *et al.*, 2016). Nevertheless, research conducted by Duan and colleagues states that customers' revisited purpose can be positively influenced by the destination image (Duan *et al.*, 2020a). In the conditions of outbound tourism from Russia to Greece, Stylos and colleagues re-confirmed the impact positively of destination image in terms of affective and conative images on tourists' intention to retravel a destination (Stylos *et al.*, 2017). Moreover, in the research of Ba Ria -Vung Tau context, the factors including: Infrastructure, Variety Seeking, Accessibility, Local food, Atmosphere, Environment, Price Value, Leisure and Entertainment were all found to have a positive impact on the intention of visitors in this area (Ha *et al.*, 2020). In detail, six components of Vietnam DI are: Appealing cultural elements; Cuisine; Natural environment; Travel infrastructure; Socio-economic environment; Natural resources and language; and Atmosphere of the place (Nocca, 2017). From this standpoint, the paper will develop the first hypothesis as follows:

H1: the destination images contribute to the tourist's revisit intention to destination.

2.5.2. The relationship of motivation to revisit intention

According to Maslow's theory, the desires of travellers were organized into a hierarchy, with the lowest level being relaxation. Based on Maslow's hierarchy of needs, (Pearce and Lee, 2005) developed a travel motivation theory labeled the Travel Career Ladder. Broadly, the theory states that with the accumulation of travel experiences, a tourist will progress upward through the levels of motivation. Meaning that, the more people travel, the more likely their motivation is to move upwards in Maslow's model. Tourists are also being pulled to destinations because of their accessibility, historical-cultural attractions, natural-ecological heritage, and service delivery (Preko, Doe and Dadzie, 2019). These elements are thought to have a direct and significant impact on tourist satisfaction, with a positive increase in pull factors increasing a traveler's satisfaction with the location (Mulia Sirait *et al.*, 2019) Destination images are well known to be strong "pull" considerations when choosing a place (Prayag, 2010). Researchers found a symbiotic relationship between these motivations, with push factors stimulating the need and desire to travel and pull factors simultaneously pulling them toward a specific destination that satisfies those needs and desires (Kim and Lehto, 2013; Whyte, 2017). These forces not only have positive impacts on tourist satisfaction, but also their future revisit intention (Qiao *et al.*, 2008).

In this context, we take into account how travel motivation can influence how a holistic image affects travel intention. It's expected that:

H2: Travel motivation including push and pull are promote the tourist's intention to revisit a destination.

2.5.3. The congruence of projected image and perceived image

Studies from both theoretical and empirical perspectives have been conducted to understand the relationship of sender-and-receiver image relationship. Generally, it was accepted that "the closer projected image and perceived image are, the better" ((Marine-Roig and Clavé, 2016). It is addressed that a potential mismatch in demand-and-supply-side images can lead to a gap between the fact and visitors' perceived image; and the more reality differs from the expectations, the less likely they are to consider the destination in their evaluation for next holiday (Goodall and Ashworth, 2013; Govers, Go and Kumar, 2007; Tsaor, Yen and Yan, 2016; Duan *et al.*, 2020a). The measurement of the image gap outlined the need for internal

stakeholders to rectify the gap between perception and reality. Therefore, the closer the gap between projected image and the perceived image, the stronger their satisfaction, thus, revisit intention (Marine-Roig and Clavé, 2016). With its beneficial impacts, achieving a good level of congruence between the projected and perceived image has become a key objective for NTOs and DMOs (Duan *et al.*, 2020b). Additionally, the congruence between images can assist tourism organisations in evaluating their activity in promoting destination image and whether or not it has been accepted by their target audience. In this regard, “gap bridging” was proposed by (Govers, Go and Kumar, 2007) as a key component in brand image analysis with the goal of addressing and closing brand image gaps at various levels (Marine-Roig and Clavé, 2016). The significance of the congruence can be hypothesized as:

H3: The concurrency between projected image and perceived image impact revisit intention.

Danang’s projected image and perceived image and revisit intention

Despite the popularity of destination images in tourism research, not much has been written about communicating DI between DMO (sender) and external stakeholders (receiver) in the context of Vietnam tourism. The review of key contributors (Nguyen, 2014; Truong, 2019) investigated the destination image from the destination’s point of view highlight as: Da Nang has long been pursuing the image of a nature and human touch city, which is defined in the “Danang fantasticity” holistic image that is central to promoting their talent attraction policy. When advocating urban design that “improves long-term community well-being and meets key unmet requirements originating from the nature of twentieth-century urban development,” the image of nature is vital (Goodall and Ashworth, 2013). However, this study only explains how tourists are perceived through secondary sources; it does not address how they perceive Vietnam from their own experiences. So, based on the Danang’s holistic image and identity, it can be expected that: *Environmental and psychological factors of Danang are the most crucial components that tourists seek for in their visit; in exchange, the policy of nature and human touch city effectively delivers the images that are meaningful to them.*

While designed to attract talent and start-ups, (Truong, 2019) argued that Da Nang was (and is) struggling with the criteria of a liveable city as investors and tourists are not benefiting from the policy. The author then discussed the recent idea of Danang as an inspiring city by (Le, 2019) in an internal unpublished document. Inspiring places was approached from peak experience: inspiring places facilitates the peak experience and personal journey beyond interaction with other people and culture to reach one’s inner self (Keken, 2015). Following that, an inspiring city highlights the importance of interaction with the other, a sense of accomplishment and creating emotional attachment through human touch. However, this theory is inappropriate with the Gen Z, besides, base on the fantasticity slogan, to orient Danang’s destination image to Gen Z, it can be considered:

- *Tourist’s perception of Danang as an fantatisticity can be effectively delivered through nature attributes: Luxurious destination, Beaches, Tropical Sun, and quality infrastructure*
- *Tourist’s perception of Danang as an fantatisticity can be effectively delivered through human touch attributes: friendliness, young, and dynamic*

2.5.4. Destination Marketing in the relation of Congruence among images and revisit intention

The rapid advancement of communication technology and internet information has led to a “eyeball economy” phase in the travel sector. Tourism advertising plays a crucial role in marketing activities (Feng *et al.*, 2022; Malvica *et al.*, 2022), since people use their cellphones to access apps, browse the internet, update their status, and share their moods on social media (Decré and Cloonan, 2019; Rao and Ko, 2021).

Advertising studies show that consumers' visual attention to advertisements is influenced by viewing tasks and viewing duration. Consumers typically spend more time watching images in commercials if they want to recall a brand. As a result, Liu et al. (2002) found that customers' perceptions, decisions, and even behaviors are significantly influenced by the visual display of information and the subsequent visual experience, Thus, it is anticipated that:

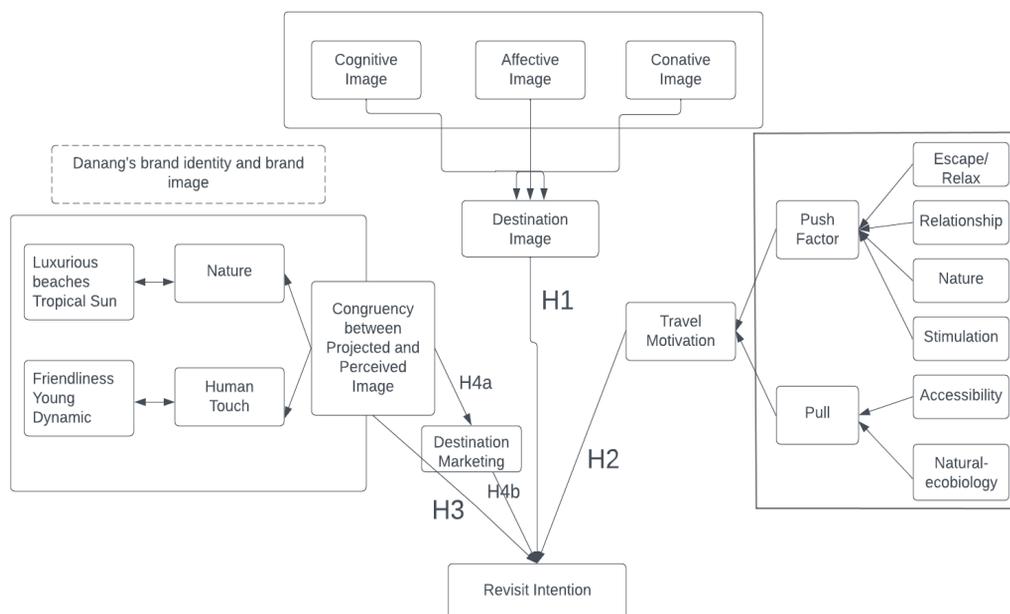

Hypothesis 4a: The congruence between images impact on the destination marketing

Hypothesis 4b: The destination marketing impact on the revisit intention of customers.

2.6. Model

In this research, there are 3 types of variables includes: 3 independent variables were employed for the destination images, congruence of images and travel motivation factors. Besides, the revisit intention considered as the dependent variable. Lastly, the destination marketing considered as the moderate variable which moderate the relationship of congruence between images and revisit intention of customers.

Figure 1: Factors impacts revisit intention of domestic tourists

Source: Author, (2023)

3. RESEARCH METHOD

3.1. Data collection

The questionnaire was chosen for efficient data collection in this study, as it improves content validity, reliability, and morality. Clustering sampling, specifically probability sampling, divides the total population into group representing a population, hence, this study was select gen Z as presentative with 200 participants in Vietnam. The age stratification was predetermined, ensuring precise conclusions for the population.

3.2. Data processing

This study utilized structural equation modeling (S.E.M.) to measure the impact of tourism destination image, motivation factors, and Da Nang's images on visitor revisit intention. The P.L.S. approach was found

to be the most effective substitute for S.E.M. S.E.M. models are considered confirmatory, as they contrast theoretical knowledge and hypotheses with actual facts. As a result, as opposed to being exploratory, these models are thought of being confirmatory. The measurement model interprets relationships between constructs and indicators, while the structural model outlines the relationships between them (Henseler, 2017).

3.3. Measurement and variable scale

The study using the Likert-scale measurement to estimate 5 variables as follow

Table 1: List of variables in the research

Variables	Types	Items	Measurement	Sources
Destination image image	Independent	20	Likert scale	(Chen and Tsai, 2007; Stylos <i>et al.</i> , 2016)
Travel motivation	Independent	18	Likert scale	(Moscardo <i>et al.</i> , 1996; Said and Maryono, 2018)
The congruence of projected image and perceived image	Independent	7	Likert scale	(Bharuchi and Rasheed, 2022)
Destination marketing	Moderate	4	Likert scale	(Diukova <i>et al.</i> , 2013)
Revisit intention	Dependent	3	Likert scale	(Kour, Jasrotia and Gupta, 2021)

4. DISCUSSION

This paper aims to identify the impact of destination image and how to motivate the tourist to (re) visit the destination, using the SEM-PLS model. Data from 170 respondents was collected and analyzed, focusing on explaining and analyzing hypotheses. The chapter compares these hypotheses to previous theories to reach the objective set.

Table 2: Hypothesis result

Hypothesis	Relationship	Path-coefficient	P values	Result
H1	DI -> RI	0.112	0.015	Supported
H2	TM -> RI	0.488	0.000	Supported
H3	CI -> RI	0.272	0.030	Supported
H4a	CI -> DM	0.643	0.000	Supported
H4b	DM-> RI	-0.134	0.045	Supported

Source: Author, (2023)

4.1. The relationship between destination image and revisit intention

Hypothesis 1: *the destination images contribute to the tourist's revisit intention to a destination.*

The first hypothesis focuses at how the DI affects a tourist's (re)visit to a destination, and the results show a significant correlation between the two variables. The hypothesis's P-value is 0.015, which is less than 0.05 and indicates a statistically significant relationship between the destination image and revisit intention. Additionally, the path coefficient value is 0.112; hence, the hypothesis concludes that DI has a favorable effect on RI.

The study found that perceptions of a destination significantly impact respondents' intentions to revisit. While cognitive and affective images have a greater impact on return intention, conative images hasnot. It emphasized that negative impressions of destination images can reduce visitors' likelihood to return and encourage alternative locations (also see tin Chi and Qu research 2018; Prayogo and Kusumawardhani (2016); Assaker and Hallak (2013) who found that perceptions of a destination could influence travelers' intentions to return there. Tourist satisfaction and behavior, such as destination selections, assessments of the destination, and plans for future behavior, will be impacted by the destination's image (Bigne *et al.*, 2001).

In detail, in terms of the cognitive image, the items have strong influence on the revisit intention for the destination including quality infrastructure (COI 1), quality service (COI 12), attractive culture festival (COI 13), adventure game (COI 14), attract cuisines (COI 12) which have the outer loading higher than 7.8, the rest are lower than 7.8 index but still have impact significantly. In terms of affective image, the relax (AI 3), excited (AI2), AI5, AI4 and AI1 have contribute to the destination images to stimulate the revisit intention of customers respectively. However, both items of the conative images have eliminated from the destination images, which mean it does has effective impact on the revisit intention of gen Z in the Da Nang context.

4.2. The relationship between travel motivation and revisit intention

Hypothesis 2: travel motivation in terms of push and pull motivation have a positive impact on the revisit intention of tourists.

Investigating how push and pull motivation can heighten a tourist's desire to (re)visit a specific region is the aim of this theory. The results indicate a strong link between the two variables. The hypothesis' P-value, which is equal to 0.000, demonstrates the strong link between travel motivation and intention to return. The hypothesis is supported by the path coefficient value is 0.488 and that TM positively affects RI.

This finding confirmed the idea that higher levels of intrinsic and extrinsic travel motivation increase visitors' likelihood of returning to a place. According to past studies (Nguyen, 2014; Chu and Luckanavanich, 2018), understanding the motivations behind people's travel can help us identify the key elements that significantly influence why they choose to visit a particular area. According to studies (Hasan, Ahmad and Ismail, 2018; Lemy, Nursiana and Pramono, 2020), when push and pull variables are satisfied, tourists' motivations may be connected to their intentions to visit or return to a particular location in the future.

Based on the items selected in PLS, it is highlighted that in the perception of Vietnam's gen Z, push motives have a higher impact on the desire to revisit than do pull motivations. In detail, the push motivation of tourists to Da Nang was to rest and relax (TMS1); connect with relatives (TMS4) ; feel belonging (TMS6); get a better appreciation about nature (TMS9); and find excitement (TMS10). Besides, the pull motivations are: trip and foods' price are affordable (TML1); quality infrastructure (TML3); attractive beaches (TML5); and impressive nature sightseeing (TML4). This finding will contribute effectively for NGOs and tourist institutions in attracting tourists' intention.

4.3. The relationship of Congruence among images and Revisit intention

Hypothesis 3: Congruence among images has positive impact on the revisit intention of tourist

The hypothesis examines the impact of local characteristics on visitors' intentions to return to Da Nang. A strong correlation (P-value 0.030) and path coefficient (0.272) are found, indicating that consistency between projected and perceived images influences RI. The findings suggest that CI has a favorable effect on RI.

The findings show that there is little difference between projected (supply) and perceived (demand) pictures of Da Nang when all have a positive effect on travelers' intentions to return and their degree of satisfaction. Other investigations have confirmed this conclusion, stating that "the closer projected image and perceived image are, the better" is true for tourists' intentions to return (Marine-Roig and Clavé, 2016). The issue of a potential mismatch between supply and demand-side perceptions is discussed. The more the reality deviates from visitors' expectations, the less likely it is that they will take the location into consideration when deciding where to go on their next vacation (Goodall and Ashworth, 2013). Thus, impact effectively on the revisit intention of congruence between images indicating the close gap between the projected images and perceived images of Da Nang city.

4.4. The Destination marketing role in the relationship of Congruence among images and revisit intention.

Hypothesis 4a: *The congruence between images impact positively on the destination marketing*

Hypothesis 4b: *The destination marketing has an inverse impact on the revisit intention of customers.*

Firstly is the H4a which indicates the impact of CI on the DM, the result shows that the CI has impact effectively in the positive way when the path-coefficient at 0.634 and is supported by the P - value.

This is because make tourists take an eye on destination's image, particularly projected visuals, is difficult. The NGOs and institutions must devise a means of getting the picture and its significance to the audience. The best option is to use destination marketing to tell clients about the destination and promote its image. visitor information has been shown to be a useful notion in understanding destination image and the visitor decision-making process (Gursoy and McCleary, 2004). The findings concur with those of the 2010 study by Monilia, Gomez, and Consuegra.. Additionally, based on the responses to the table 2, the social media technique (DM2) was identified as the most appropriate by respondents to obtain destination information among the destination marketing methods. According to Bertot et al. (2010), social media (DM2) has actually greatly improved customers' ability to acquire knowledge about travel information. Individual travel plans and leisure-time consumption patterns are significantly altered by social media because it improves information exchange, reduces uncertainty, and develops a sense of community among users (Zehrer and Grabmüller, 2012). Therefore, when customers search for travel-related information online, social media has become an essential avenue for creating, sharing, and marketing user-specific content (Xiang and Gretzel, 2010; Sin et al., 2020). Even in the middle of the COVID-19 outbreak, a large number of consumers are being persuaded to travel by the expanding UGC content pertaining to tourism (Flores-Ruiz et al., 2021).

Second, the H4b illustrates the inverse effect of destination marketing on the intention to return, which is corroborated by the path coefficient of -0.134 and the P-value of 0.045. With the contrary result, it is evident that increased advertising may result in fewer tourists returning, and vice versa. This can be interpreted in terms of the fact that marketing that exaggerates Da Nang's image would result in less repeat visits and a negative perception of the city among tourists. Travelers must rely on the information provided to them through marketing channels because the tourism productions are ethereal and cannot be physically experienced before being purchased. Although it's common practice to use exaggerated images to pitch products, marketers frequently aren't aware of how this can influence future product evaluations (Alcocer and Lopez, 2019). The commercials lose their utility and credibility when passengers found that the experience is different from what they were shown in the advertisements, which leads to dissatisfaction. Hence, Delivering on promises made as destination marketing is crucial (Kotler, Bowen, and Makens, 2020).

5. CONCLUSION AND RECOMMENDATIONS

5.1. Conclusion

This research examines the impact of destination images, travel motivations, and image congruence on revisit intention in Da Nang's tourist recovery post-Covid. The SEM panel data model was used to examine the relationship between variables. Results show that destination images positively influence customer revisit intentions, travel motivation significantly affects revisit intention, and congruence between images indicates a close-gap, encouraging revisitation. Destination marketing moderates the association between pictures and visitors' intentions to return, but has the opposite effect on customers' intentions to return due to unrealistic marketing.

5.2. Recommendations

First of all, destination images are a crucial predicate for consumer revisit intentions based on the association between customer revisit intentions and destination images. It is critical to establish a strong brand identity and promote it successfully. Influential people in the tourism industry are aware of the destination's reputation, which could be a competitive advantage (Foroudi et al., 2018). Therefore, organizations like NGOs and universities need to create positive, enticing destination images of Da Nang that encourage customers to feel content and at home before continuing their journey. Visitors believe that the cognitive picture is the most appropriate when traveling, therefore their intention to return will be greatly influenced by their experience and beliefs. In detail the company should focus on the COI 1 (infrastructure), COI 3 (famous destination), COI 7 (night entertainment service); COI 12 (attract cuisines); COI 13 (quality service). Moreover, the company should emphasize the feeling that the destination can bring to customers, which are AI2 (excited), AI3 (relax), and AI5 (fun).

Based on the result, destination marketing effectively conveys images through word-of-mouth and social media, but deceptive advertisements can reduce customer revisit intention. It is crucial for destination marketing to ensure realistic, suitable images that convey the destination's inner meaning. Besides, the images of Danang has highly perceived as CI1-friendly, CI2-youthful and CI3-dynamic which suitable with the spirit of gen Z. This finding has important implications for rural destination marketing when promoting Da Nang's projected and perceived images, noting that the positive meaning and images should be conveyed significantly through social media to reach more audiences.

Last but not least, the motivation to make revisit decision is vital. Based on the aforementioned findings, NGOs and travel agencies have a responsibility to grow and improve the pull motive; specifically, the TML 3 (infrastructures) needs to be developed which is an advantage compared to other tourist destination like Quang Ngai city. In addition, it is necessary to maintain the quality of food and its price (TML 1), green and clean beaches (TML 5) to improve the satisfaction of visitors when traveling.

5.3. Limitation and further research

There are certain shortcomings in the study. For convenience, the constructions related to before and after the visit were measured simultaneously, that is, after the site visit. As a result, it was impossible to determine respondents' impressions of the site before they visited. The estimated items for the variables continue to overlap as well, which makes the analysis more difficult. Last but not least, the research was restricted to Da Nang destination and specifically gen Z owing to time limits, therefore it did not cover the full tourism industry.

So, the future research is expected to recover these limitations and aim for both domestic and foreign tourists to compare the difference in two types of tourists' behaviors and tendencies when traveling.

IMPROVE PRODUCTIVITY AND QUALITY OF CONSTRUCTION ENTERPRISES LISTED ON VIETNAM'S STOCK MARKET

**Author: Phan Bich Ngoc¹, Tran Anh Duong¹, Ho Thi Phuong Thao¹,
Nguyen Mai Phuong¹, Tran Anh Ngoc¹
Mentor: Doan Huong Quynh¹**

ABSTRACT: The renovation of the country over the past 40 years has achieved many achievements, in which the construction industry has made outstanding contributions. Along with different economic sectors such as: agriculture, industry, services, the construction industry is one of the key economic sectors of each country. Bearing those responsibilities, it is impossible not to mention the role of the construction enterprises, especially construction enterprises listed on Vietnam's stock market. To be able to survive and develop in the fiercely competitive environment of the market economy, construction enterprises in general and our country's construction enterprises in particular are facing great opportunities and challenges. To be able to stand firm in the market, it is required that each construction company greatly improve its productivity and quality. The improvement of productivity and quality for enterprises in general and construction enterprises in particular is an urgent requirement in the current integration context.

Keywords: construction industry, opportunities, challenges, the improvement of productivity and quality

1. INTRODUCTION

1.1. Context of the research

- Research topic on factors affecting productivity and quality for enterprises, specifically construction enterprises listed on the stock market in Vietnam.
- The authors have surveyed the financial statements of typical construction companies listed on the stock market in the period of 2017-2021, from which to analyze and give comments as well as objective solutions to improve productivity. quality performance for the above enterprises.

1.2. The results of the research project

The study identified two main groups of criteria that affect the productivity and quality of listed construction companies: the group of overall productivity indicators, the group of divisional productivity indicators. Evaluation and analysis of the above groups of indicators let readers know the ability to raise capital of listed construction enterprises in Vietnam over the years in terms of scale and method of mobilization; The profitability of some listed construction companies is also affected by the Covid-19 epidemic; solvency of listed construction enterprises; the setting up of annual reserve funds of enterprises and the outstanding limitations and risks that need to be resolved and handled.

1.3. Rationale for conducting the research

Overall research purpose: improving productivity and quality of construction companies listed on the Vietnam stock market.

Specific research purpose:

¹ Academy of Finance.

- Determine the factors affecting the productivity and quality of construction enterprises listed on the Vietnamese stock market
- Measuring the impact of factors on the productivity and quality of construction enterprises listed on the Vietnamese stock market
- Proposing solutions and recommendations to overcome and improve the productivity and quality of construction enterprises listed on the Vietnam stock market

2. THEORETICAL FRAMEWORK

2.1. The concept of productivity and quality of enterprises

Productivity is not a new concept, which has gradually appeared in the process of production and exchange of goods. The producer of goods has been very interested in how to produce many products at the same time. more products – in a simple meaning, productivity. However, over time, the concept of productivity is no longer limited to how many products are made per unit of time or how many products a worker produces in a day, but is a factor of productivity. productivity is associated with the market, and the competition and therefore will go hand in hand with the quality factor.

Quality is a familiar and commonly used concept in the field of human activities. However, quality is also a complex category, an issue that causes much controversy and disagreement. In enterprises, quality is understood as product quality and broadly understood to ensure benefits between the parties including the interests of customers, the business, and society related to environmental protection, sustainable development

2.2. The role of productivity and quality in enterprises

Currently, the enterprise is in the period of resuming production and business after a prolonged period of the Covid-19 pandemic; Competition is becoming more and more fierce. In that context, enhancing productivity and corporate quality is an important factor to support business development.

A highly productive organization is more likely to return on investment. Such institutions are also more resistant to any state of the economy. For a less productive organization, it is possible to achieve a relative surplus due to other competitive business conditions, but is very vulnerable to crisis in recession economy

The productivity of a business has an important impact on national issues such as inflation, domestic and international competition, employment levels, and national budgets. A study conducted by the American Institute of Industrial Engineers found that 60% of senior industrial managers consider productivity to be one of the top two or three most important issues facing each country. They also point out that the consequences of low productivity include:

- Difficulty in selling products and services domestically as well as abroad.
- Reduces quality of life as well as international attraction and influence.
- Failure to meet health, education and social welfare needs.

Productivity and production costs have an inverse relationship. This means improving productivity reduces production costs and increases sales efficiency, thereby increasing the output of the value-added system, creating more jobs. Countries such as Germany, Japan, Taiwan, and Singapore are proof of how productivity enhancement has enhanced their competitive position in the international arena.

3. THE SITUATION OF PRODUCTIVE QUALITY OF CONSTRUCTION ENTERPRISES LISTED ON VIETNAM STOCK MARKET

Firstly, some enterprises face difficulties in capital flow, costs, escalating prices, lack of human resources...Some enterprises have low self-financing and debt mobilization, which greatly affects productivity

and quality. of enterprises, the capital structure is not reasonable, not suitable with the business plan and development strategy of the enterprise. This is continuing to become a great burden for businesses and construction contractors, forcing many units to switch from speeding to “defensive”. The capital growth rate among groups of construction enterprises is uneven, even decreasing such as construction enterprises with a scale of less than 500 billion VND, the group of construction enterprises with more than 50% contributed capital by the State, and the group of construction enterprises. Self-financing ability of some enterprises is low, typically the group of construction enterprises with capital scale of over 1000 billion, the group of construction enterprises with more than 50% capital contributed by the State and the group of construction enterprises. Besides, the group of construction enterprises with capital scale of less than 500 billion, the group of construction enterprises without state capital contribution, the group of construction enterprises with low debt capital. The low capital scale causes these groups of enterprises to face many difficulties in the process of production and business activities, in the expansion of production scale, in technological innovation, etc. The capital structure of the majority of construction enterprises is not reasonable and appropriate, which makes business performance not as good as expected. Having an optimal capital structure, enterprises will be guaranteed to operate efficiently and safely. However, the operating efficiency of the construction enterprises in the industry is markedly different. There are businesses with high growth and strong development, but on the contrary, there are many businesses that operate inefficiently, leading to heavy losses.

Secondly, the profitability of some construction enterprises is not high. It means that the use of capital is not efficient, productivity is poor, investment projects have not been rigorously appraised, and effectiveness is not guaranteed of the project. During the five years of research, profitability of state-owned enterprises has fluctuated, although these indicators have increased during this period, but still at a modest level. From that, it shows that the appraisal and assessment of investment efficiency of the project is not good, many projects are delayed, not up to the construction schedule and the management and use of capital of these groups of enterprises is still poor. many limitations.

Thirdly, the ability to compensate for losses when risks occur in production and business activities of enterprises have not been paid due attention. Besides the construction enterprises that have taken measures to set up provisions such as buying insurance for works and projects to compensate for business risks, there are still many enterprises that have not paid much attention to this work. Because these deductions are mostly used to encourage implementation, not mandatory. Therefore, in practice, the setting up of provisions for construction enterprises listed on the Vietnam stock market is rarely done or when implemented is only a formality, not suitable for its purpose and meaning. Many businesses even take advantage of this provision to make provisions when in fact these amounts are not included in expenses just to reduce taxable income and evade CIT. There are very few construction enterprises listed on the Vietnam stock market that buy insurance to prevent risks in production and business, risks of natural disasters, etc. Even though they have enough conditions to set aside, they still want to take advantage of this provision for investment.

Fourthly, the ability to ensure financial safety is low. The quick solvency of the construction enterprises showed signs of steady increase, although the increase was not remarkable, and the two current solvency indicators, the instant solvency, tended to change unstably. With such solvency plus the characteristic that the industry uses a large capital scale, construction enterprises listed on the Vietnam stock market will be at a disadvantage when raising capital. In addition, this indicator is also a warning sign of potential financial difficulties in the future for construction enterprises listed on the Vietnam stock market. In addition, if the ability to compensate for losses when risks occur in business activities is low, unable to compensate for the risks that occur, the enterprise will be insolvent, leading to bankruptcy.

4. SOLUTIONS TO IMPROVE THE PRODUCTIVITY AND QUALITY OF CONSTRUCTION ENTERPRISES LISTED ON VIETNAM'S STOCK MARKET

First of all, build a suitable raising capital strategy for listed construction companies

Due to the characteristics of construction enterprises that need a very large amount of capital, for the financial managers of construction enterprises, the problem of building a capital mobilization strategy to both meet the capital needs for the business process and create favorable conditions for the construction industry plus the conditions to improve the efficiency of capital use for enterprises are very important issue. Currently, the forms of raising capital in construction listed enterprises are not diversified, the main ones are still traditional forms such as commercial credit, bank credit, prepayment by buyers, initial capital contribution and use of capital and use of retained earnings. Therefore, in the future, it is necessary to diversify forms of capital mobilization such as foreign direct investment, bond issuance, and financial leasing. Enterprises need to develop a detailed and specific raising capital strategy for each traditional raising capital channel, and at the same time research and plan to approach new raising capital channels. Beside the diversity of capital mobilization and detailed raising capital strategy, the solution is equally important for construction enterprises, which is to build a strong credit relationship network, create good relationships with credit institutions, applications, business partners, join mass organizations, associations, actively participate in forums and social activities to increase investment opportunities.

Moreover, good management of receivables, inventory, and cash capital helps to improve the solvency of the business, thereby helping to accelerate the cash generation cycle in the business.

Enterprises with high solvency will create trust with business partners, with customers and with commercial banks and credit institutions, thereby helping the enterprise's capital turnover turn faster. productivity and quality of capital of the enterprise will be improved. In order to improve the solvency of SMEs, it is necessary to pay attention to the following issues: Firstly, good management of receivables: Enterprises need to study and evaluate the financial situation of the investor, the ability to sell products to decide to participate in the bidding; It is necessary to clearly stipulate the sales policy, credit policy, discount policy, payment term, payment method, etc. When signing a contract with the investor, thereby serving as a basis for resolving disputes when signing a contract with the investor. necessary. Monitor the debt situation regularly, periodically, arrange the time of the receivables, take timely measures to urge the payment of the debts that are about to be due. Secondly, For inventory management of construction enterprises: Because of the specificity of the construction industry, which is the construction of large works and projects, the time is long, so inventory accounts for a very large proportion. Therefore, in order to improve inventory management, construction enterprises need to promote the centralized procurement and contract management model for main materials at the construction site; take advantage of finance to reduce the price of material supply; forecast market price situation; proactively implement contracts for early purchase and import of essential materials and equipment for the project; Actively looking for new sources of quality and reasonable prices; Upgrade the construction organization model with the participation of subcontractors to share risks. Third, the good management of capital in cash will help businesses not only help businesses have many favorable opportunities in production and business but also improve their reputation in the market. construction enterprises listed on the Vietnam stock market need to make plans to forecast their cash capital expenditure needs at different times of the year. Thanks to good cash flow management, enterprises always ensure that they have the necessary amount of cash to pay for expenses, thereby ensuring solvency in the enterprise, helping to maintain financial security, and contributing to ensuring financial capacity. main.

In addition, to build a reasonable capital structure in line with the business plan and development orientation of the construction enterprises listed on the Vietnam's stock market. Each SME can use one or more capital sources to finance production and business activities. With the characteristics of the construction industry that requires a very large amount of capital and the capital market, the construction time of works and projects of construction enterprises often takes a long time, therefore, construction enterprises need to have a capital mobilization strategy and structure. capital suitable to the production and business situation and development orientation of enterprises in the coming time. In order to do this well, construction enterprises need to establish a close relationship between the direct production and business departments and the capital management department of the enterprise to promptly grasp the production and business situation of enterprises. When grasping the capital needs of the enterprise and the current situation of the enterprise, the capital management department will calculate the capital sources that the enterprise can mobilize, the cost of mobilizing each of those capital sources, the advantages and disadvantages of each. disadvantages of each of those capital sources and taking into account the risks that may be encountered... In addition, regular supervision is required to promptly adjust capital structure due to changes in the macroeconomic situation as well as production and business activities of enterprises.

Furthermore, strengthen measures to prevent risks in production and business activities of construction enterprises. A risk is an unexpected bad event that occurs in production and business activities, leading to losses for enterprises. In order to overcome and minimize risks to the lowest level, the construction enterprises need to conduct an assessment of the probability of the occurrence of risks for each field and the extent of damage incurred when the risks occur. Also determine the type of insurance available for that type of risk and the cost of insurance. On that basis, decide whether to self-insure or buy appropriate insurance for each type of risk. In addition, businesses need to pay attention to the issuance of regulations and regulations on labor safety, and strengthen safety control at construction sites.

Last but not least, training and fostering the workforce and improving the skills of workers. The labor force is a decisive factor to the production and business efficiency of an enterprise. Therefore, in order to improve the efficiency of production and business, enterprises need to have a plan to train their staff, including: improving labor selection standards, ensuring the quality of specially recruited employees. for managers and in parallel with training, the regular inspection and assessment of qualifications as well as the progress of employees. At the same time, it is necessary to encourage employees to constantly learn and improve their knowledge to meet technical requirements. If the training does not have a positive change, the capacity as well as the health is not suitable, it is necessary to take tough measures such as rearranging work positions or even dismissing these subjects.

5. CONCLUSION

The construction industry in general and the construction enterprises on the Vietnamese stock market in particular play an important role in the economic development of the country. Every year, the contribution to GDP of construction enterprises accounts for a large proportion, creating jobs for a large number of workers and creating high added value for the economy.

FACTORS INFLUENCING THE DEVELOPMENT OF E-COMMERCE IN VIETNAM

Author: Pham Thi Phuong¹

ABSTRACT: Before the Covid-19 pandemic began, consumers' level of access to technology as well as online shopping habits of Vietnamese customers have not equaled with the growth pace of the regional and international digital economy, leading to the E-commerce has not really taken advantage of the digital economy. The research analyzes factors affecting the development of Vietnam's e-commerce in the current booming digital economy. The papers also analyzes the impact of the Covid-19 pandemic on the economy as well as market restructuring, consumer spending habits, and technology revolutions. Besides, authors analyze the development of e-commerce in the current virtual economy and propose a sustainable development direction for Vietnam's e-commerce industry in the future.

Keywords: E-commerce, digital economy, economical factor, legal factor, human factor, technological factor.

1. INTRODUCTION

The more society develops, the more geographical limitations in the life and culture of citizens of each country reduce. Thanks to the exceeding advance of science and technology, people can now narrow the distance between continents all over the world. Science and technology developments as well as the increasing globalization of economies have bolstered the birth of e-commerce. Nowadays, online shopping has been more and more prevalent in normal life and has become one of the most important parts of the economic structure. This is a potential industry in the digital economy where technology renovations always change over time, especially in Vietnam where they are widely applied to social life in general and businesses in particular. On the one hand, e-commerce contributes to the formation of new business models, increases revenue, helps reduce costs, improves business efficiency and opens up a large market for both domestic and foreign customers. Moreover, e-commerce has enhanced convenience and speed for customers when helping buyers who are living far away but still be able to choose goods or services around the world by clicking just a few simple taps on a smartphone or computer. E-commerce is now one of the most important driving forces to promote social and economic developments, and is a key factor in accelerating the internationalization of world economic life. Thanks to the applicability of e-commerce, a wide range of businesses, even the poorest country or a remote area still has the ability to access larger markets through the Internet. E-commerce not only supports but also promotes commercial activities of businesses to get over the territory of the country to become a global and truly integrated activity.

2. RESEARCH OVERVIEW

Many studies have examined the relationship between information technology infrastructure, social cognitive infrastructure and the development of e-commerce. Tining Haryanti and Apol Pribadi Subriadi (2019) argue that "Trust" always appears as an important factor in the adoption of e-commerce, especially in the early beginning when e-commerce was introduced as an alternative to traditional stores. They believe that over time, the more e-commerce grows, the more "Trust" becomes an inherent part of the system and plays an important role in the sustainability of e-commerce. Meta&Bain (2022) argues that the rapid growth

¹ Academy of Finance.

of e-commerce in the region, driven by increasing internet penetration, rising disposable income as well as the significant increase of mobile technology adoption and public awareness

There have been several researches on the impact of social cognitive infrastructure and information technology on e-commerce. Many factors and characteristics related to the influence of these factors have been explained by previous studies (Muhammad Dharma et al., 2018); (Vipin Jain, Bindoo Malviya, Satyendra Arya, 2021). However, previous research results did not mention social awareness and information technology factors, forgetting that legal and economic factors also have a profound influence on the promotion of online commerce. Moreover, the continuous changes of technology and the rapid development of online sales platforms along with the outbreak of the Covid 19 pandemic in many countries have completely changed people's point of views about online shopping. Therefore, insight research on the influence of four factors on the development of e-commerce is absolutely necessary. The main objective of the study is to clarify the impact of 4 factors Technology, Law, Society and Economy on e-commerce in Vietnam, and finally to propose several recommendations for the development of the Vietnam's e-commerce market in a sustainable way in the future.

3. RESEARCH METHODOLOGY

We use general methodological research methods. In addition, we also use a combination of other methods such as statistics, analysis, evaluation, synthesis, ...

- Descriptive statistics method: Through detailed descriptions of the indicators analyzed from the collected data source.

- Statistical method, comparing data of e-commerce development in 3 regions of the country through the period 2016 - 2022 in Vietnam in the context of the digital economy.

- Synthetic analysis method: the collected information and data are analyzed in terms of the necessity and unnecessary of the collected data to summarize and put into the research paper.

4. RESEARCH RESULTS

Overview of the current digital economy:

By the end of February 2023, there have been more than 78 million chip-based identification cards successfully issued in Vietnam, and online public services have been widely deployed with high efficiency. The percentage of people using the internet and online services is increasing significantly.

The contribution of the digital economy to GDP continues to increase; many businesses actively transform digitally. The proportion of added value of the digital economy in GDP by the end of the first 6 months of 2022 will reach 10.41% (this proportion will be 9.6% in 2021). The rate of enterprises paying taxes electronically reached 99%.

Many financial technology companies (fintech) have been established in Vietnam, such as: Online Mobile Services Joint Stock Company (M-Service) – MoMo e-wallet; Fiin Financial Technology Innovation Joint Stock Company – FIIN CREDIT; AirPay- ShopeePay Joint Stock Company... Along with fintech companies, the transportation sector also launched many digital technology - digital economy applications in business to compete with Grab, Uber such as FastGo, Be, etc. VATO... In the field of tourism, Vietnam has applications such as: Mytour, Luxstay ... competing with Booking, Agoda or AirB&B of the world...

The digital economy in Vietnam is experiencing positive changes in recent years. Not only the renovation of a wide range of technology applications but also the level of people's access to technology has dramatically risen. To take advantage of opportunities, especially the development of e-commerce - one of the most important components of the digital economy, Governments and enterprises need to have appropriate strategies.

Overview of current e-commerce:

E-commerce (Virtual shopping), is the buying and selling of products or services over electronic systems such as the Internet and computer networks. E-commerce is based on several technologies such as electronic money transfer, supply chain management, Internet marketing, online transaction process, electronic data interchange (EDI), inventory management systems. and automated data collection systems.

E-commerce today involves everything from ordering “digital” content such as instant online consumption, order goods and general services, “meta” services facilitate other forms of e-commerce. At the institutional level, large corporations and financial institutions use the Internet to exchange financial data to facilitate domestic and international business. Nowadays, data integrity and internet security in e-commerce are increasingly being focused on by businesses and governments.

Currently, there are many views on the forms of participation as well as how to divide these forms in e-commerce. If divided by participants, there are 3 main objects including: Government (G - Government), businesses (B - Business) and Customers (C - Customer or Consumer). The main forms of e-commerce include: business to business (B2B); Business to Customer (B2C); Business to Employee (B2E); business to government (B2G); Government to Business (G2B); Government to Government (G2G); Government to Citizens (G2C); Customer to Customer (C2C); Customer to Business (C2B); online-to-offline (O2O); Mobile commerce (m-commerce).

4.1. Technological factors**4.1.1. About Internet infrastructure**

Information technology (IT) is a term that includes software, internet networks, and computer systems used for the distribution and processing of data, exchange, storage and use of information under different forms and is also the foundation of “digital economy” in general and “e-commerce” in particular. Information technology (IT) is an integral part of the infrastructure for e-commerce in Vietnam. IT infrastructure for e-trade can be divided into many different components such as: Internet, Payment system, Information management system, Information security, Customer support service.

About the percentage of internet users across the country:

Year	Number of Internet Users	Percentage (%)
2016	49.063.762	52,68
2017	53.860.000	57,28
2018	55.190.000	58,15
2019	59.200.000	61,53
2020	68.170.000	70,53
2021	68.720.000	70,3
2022	71.100.000	73,2

Table 1: Number of Internet users over the years from 2010 to 2022.

Source: internetvietnam.net

+ It is noticeable that the growth of Internet users is the most different after the milestone of 2019. In the period before 2019, the average growth rate of the number of users in using the internet per year fell to 33,601,773 people per year, after 2019 to date has increased to 39,666,666 people per year.

+ The number of internet users in 2022 will reach 71.1 million users, 2.65 times higher than in 2010 and tend to increase in the following years.

Recently, Vietnam has advanced telecommunications - Internet with modern technology with a high Internet universality. The Internet not only has become an essential element in people’s lives but also bolsters the infrastructure of the economy and play an important factor in promoting the industrialization and modernization of the country.

+ After 25 years, Vietnam now has 72.1 million Vietnamese people using the Internet (accounting for 73.2% of the population) in daily life, ranking 13th in the world.

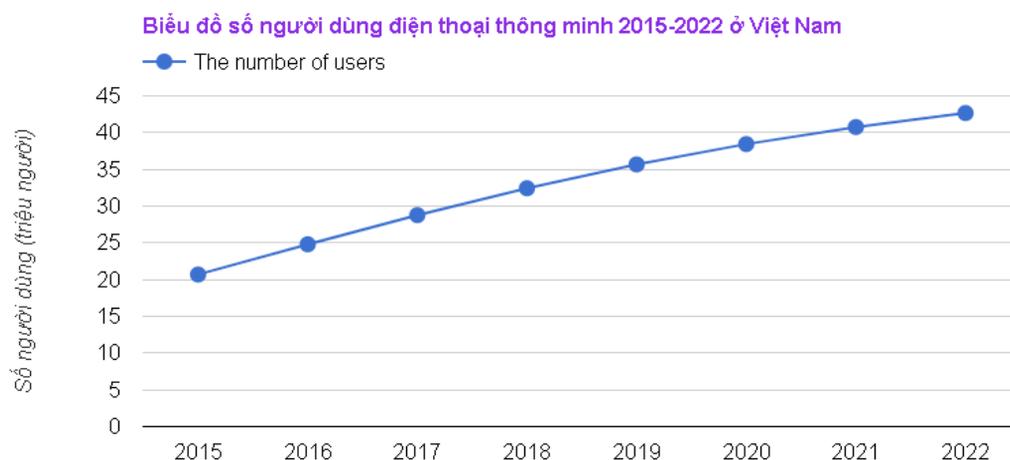

Figure 1: Number of smartphone users in the period 2015 - 2022 in Vietnam (Unit: Million people)

Source: Market research firm Statista

+ Mobile broadband infrastructure has covered 99.73% of villages nationwide; 19.79 million households have fiber optic cable, reaching 72.4%. Fiber optic cable systems have been deployed to 100% of communes, wards and townships, 91% of villages, 100% of schools.

+ The number of mobile phone subscribers using smartphones is 94.2 million; the number of mobile broadband subscribers is 82.2 million, accounting for 74.3% of the population. There are more than 564 thousand domain names “.vn” ranked 2nd in ASEAN, top 10 in Asia - Pacific region.

From that, it can be seen that, although starting slowly compared to the global process, after 25 years of constant efforts, Vietnam has risen to catch up and go with other countries in the region and the world. Despite being affected by the Covid-19 epidemic, Vietnam still maintains a stable growth in the number of mobile phone users every year.

Moreover, Vietnam’s 5G network has been tested and started to be deployed by the end of 2021. In Vietnam, Internet service charges are moderate, accessible, especially broadband Internet service charges rate is also the lowest in the Asia-Pacific region.

4.1.2 Protection and confidentiality of personal information

Kaspersky’s survey in April 2022 found that about 75% of individuals in Southeast Asia encountered at least one online threat when making digital payments. The survey also highlighted that a fraction of participants reported experiencing social engineering scams via text messages or calls (37%), encountering phishing websites (27%), becoming a victim to fake offers and transactions (27%) and a proportion of respondents admitted to having been scammed (25%) by such forms...

Social engineering scams are the biggest attack threat in most Southeast Asian countries such as

Indonesia (40%), Malaysia (45%), Philippines (42%), Singapore (32%) and Vietnam (38%). 52% of respondents reported losing money due to bank account and credit card fraud. Of these, 23% lost less than \$100, 13% lost between \$101-500, and 48% lost no money. The top five threats leading to financial loss in Southeast Asia are hacked accounts (47%), fake and phishing apps (45%), disguised malware (45%) and fake offers and deals (43%).

Some scam tricks through e-commerce platforms: Facing the situation that scams to appropriate property through e-commerce platforms are taking place increasingly popular. The Department of E-commerce and Digital Economy has issued a warning about the tricks to appropriate property through e-commerce platforms as follows:

The first form: The scammer often sets up a seller account with fake information on the e-commerce platform, then fakes the actual shops and business companies to create trust for customers.

Scammers offer products for 3-4 times less than the list price and use descriptions like “shock sale” or “liquidation”. These products are often small, high-value, easy-to-fake items such as electronics and phones. When a buyer places an order, their personal information is provided to the e-commerce platform. The scammers then use communication methods like Zalo or Facebook to contact buyers and entice them to buy discount codes (vouchers) for online transactions outside the e-commerce platform at low prices. . After the victim purchases the payment, the scammers will block communications or send parcels containing items of no value.

The second form: Scammers place orders in a suspended or canceled state but still creates shipping orders of shipping companies to the buyer’s address.

Scammers swap the real product for a fake or worthless item. Victims use prepaid payment, do not check the product when receiving or mistakenly think that the product they ordered on the e-commerce platform should be paid normally. Since the victim’s transactions take place outside of the e-commerce platform, product returns and refunds are not guaranteed because the e-commerce platform’s system does not record any purchases or identify damaged users.

The third form: Scammers claiming to be employees of e-commerce platforms support the return and exchange of orders that you have placed on previous e-commerce platforms.

In addition, there are many ways that personal information can be stolen on e-commerce platforms. A common method is exploiting security vulnerabilities to steal COD order information. They then create fake orders with the same information as the original order and send them to the customer, demanding payment. This is often successful because customers rarely check their orders before receiving them, and some shipping companies don’t allow customers to check their orders when they receive them.

4.2 Legal factors

The development of Vietnam’s legal infrastructure has been associated with economic growth and social progress over the past decades. Since the start of Doi Moi in 1986, Vietnam has transformed from one of the world’s poorest countries into a middle-income economy.

The government has promulgated many mechanisms and policies over the years to create a legal environment for the e-commerce market to develop. Some examples include Decree No. 52/2013/ND-CP on e-commerce, which establishes a legal framework for transparent and fair e-commerce transactions; Decree No. 124/2015/ND-CP amending and supplementing a number of articles of Decree No. 185/2013/ND-CP sanctioning administrative violations in commercial activities and protecting the interests of consumers;

and Decision No. 689/QD-TTg approving the E-commerce Development Program for the period 2014 - 2020. The Government has also established the Vietnam E-Commerce and Digital Economy Agency (iDEA) to monitor the development of e-commerce and digital infrastructure in the country. iDEA plays an important role in developing policies, driving innovation, and providing support services to businesses and consumers in the e-commerce sector. For example, it provides legal advice, helps businesses protect their intellectual property rights, and assists in resolving business-to-consumer disputes.

Furthermore, since 2005, the government has consistently implemented long-term policies for e-commerce development through Master Plans for each 5-year period. The most recent is the Prime Minister's Decision No. 645/QD-TTg dated May 15, 2020 approving the National E-commerce Development Master Plan for the 2021-2025 period. The objective of this plan is to make e-commerce a leading field in the digital economy by applying advanced technologies of the fourth industrial revolution to increase business efficiency, modernize distribution systems, improve the competitiveness of enterprises, and promote the development of domestic and export markets.

The plan sets specific goals by 2025, in which 55% of the population participates in online shopping with an average spending of 600 USD/person/year. B2C e-commerce sales are expected to increase by 25% per year and reach 35 billion USD, accounting for 10% of the total retail sales of the country. The plan also sets a target of non-cash payment in e-commerce reaching 50%, 80% of e-commerce websites integrating online ordering function and 40% of businesses participating in mobile e-commerce activities. In addition, the plan includes training courses on e-commerce application skills for one million businesses, business households, government officials and students.

Vietnam's e-commerce legal system has been perfected day by day, basically meeting and protecting the interests of domestic businesses and consumers.

4.3. Social factors

4.3.1. Social awareness

Consumers are more open-minded than the past to interaction and experimentation, which leads to a change in behavior. There are 64% of users reporting that they have interacted with a business's online sales and customer service account in the last year. In Vietnam, the average sales of entertainment, streaming and creator-related products in the three months before the survey increased 12 times. According to a report by Meta and Brain Company, Vietnam's adoption rate of future technologies such as financial technology and real technology is among the top in Southeast Asia. 58% of digital consumers in Vietnam have used Fintech solutions (Momo e-wallet, cashless payment...) in the past year. Virtual currency, NFT digital assets, virtual reality technology, etc. have been known and accepted by many Vietnamese people. For example, with virtual reality technology, 29% of people surveyed said they are interested and will likely use it in the future.

According to Tining Haryanti and Apol Pribadi Subriadi (2020), the importance of "Trust" cannot be underestimated when considering the adoption of e-commerce, especially during the initial rollout phase of traditional retail. The authors argue that the more e-commerce expands, the more "Trust" gradually ingrains in the system and assumes an important role in ensuring the long-term viability of e-commerce. Trust plays an essential role in shaping the growth and success of e-commerce. The foundation of any online transaction is built on trust, as customers need to ensure that their sensitive information, such as credit card details and personal data is handled safely. Trust affects a consumer's willingness to shop online, share personal information, and conduct financial transactions. It is a multifaceted concept that includes factors such as website security, data security, reliable customer service, transparent business practices,

and positive customer reviews. When e-commerce platforms prioritize confidence-building measures, such as implementing strong security protocols, providing clear privacy policies, and bolstering customer supporting systems in a faster and more trusted way, they can enhance customer trust and loyalty. On the contrary, a lack of trust can discourage potential customers, lead to cart abandonment, reduce sales, and negatively impact the overall growth of e-commerce.

Therefore, cultivating trust is vital for the sustainable development and prosperity of e-commerce businesses.

4.3.2. Human Resources

According to TopDev's Vietnam IT human resource market report 2021, the demand for IT human resources in Vietnam has continuously increased over the past 5 years. In 2021, Vietnam needs 450,000 IT personnel, but currently there are only 430,000 programmers in the country, and 20,000 positions will not be filled in the near future. This shortfall is due to the gap between the programmer's qualifications and the business requirements. Currently, only about 16,500 students (nearly 30%) out of 55,000 IT students have the skills and qualifications to meet the needs of businesses. This highlights the urgent need to improve the quality of IT education in Vietnam and promote IT career opportunities to attract more students into the field. The shortage of high-quality human resources in Vietnam could lead businesses to hire human resources from abroad.

4.4 Economic factors

According to the General Statistics Office, in the first three months of 2023, the gross domestic product increased by 3.3% over the same period last year. In which, the total retail sales of consumer goods and services was estimated at 1,505.3 trillion VND, up 13.9% over the same period last year. According to VECOM, business activities on e-commerce platforms and social networks are the highlights of Vietnam's e-commerce industry in the period of 2022 and the first quarter of 2023.

Notably, the survey results of VECOM show that up to 65% of businesses have implemented business activities on social networks. In addition, the number of employees in enterprises who regularly use tools such as Zalo, WhatsApp, Viber or Facebook Messenger has also significantly increased year by year. By the virality of Tiktok with young generations, TikTok Shop has surpassed Sendo and Tiki to rise to third place in the e-commerce market and become a strong competitor that big platforms like Shopee and Lazada have concern about.

According to We are social & Hootsuite's "Digital 2021 global overview report" by the end of 2021, there are 58.2% of Internet users in Vietnam participating in weekly online shopping, approximately the global average rate of gender reached 58.4%. Although the rate of participation in online shopping is approximately the same as in the world, "the proportion of e-commerce revenue compared to the total retail sales of consumer goods and services national consumption" of Vietnam in 2021 (approximately 6.7%) is much lower than many countries in ASEAN and oversea, compared to South Korea (approximately 42%), the United Kingdom (approximately 29.5%), Indonesia and mainland China (approximately 28.5%). This is also one of the reasons why we need to seriously review the situation of the e-commerce industry to develop more sustainable and stronger.

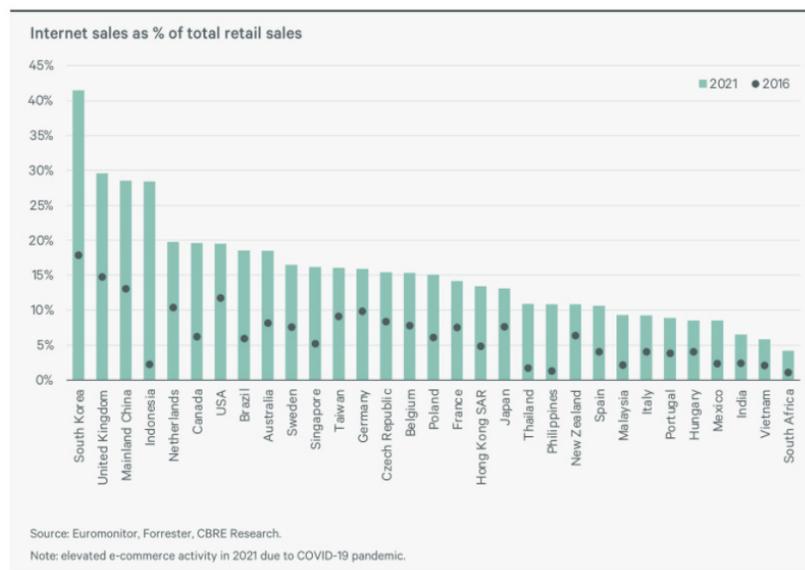

Figure 2: Internet sales as % of total retail sales

Source: Digital 2021 global overview report

From the beginning, E-commerce has always been associated with production and consumption activities. A country who has a strength in manufacturing domestic production would have a huge advantage in the long-term development of e-commerce among other factors.

Overview at the internal production capacity of Vietnam:

First launched in the Vietnamese market in October 2019, which was also the beginning of the pandemic, Amazon had a point of view “must consider this market”. About the domestic production capacity of Vietnam, Amazon argues that although Vietnam is one of the leading exporters in the world, most of the goods exported from Vietnam are from FDI enterprises located here. Most Vietnamese businesses only focus on the group of traditional goods such as rice, coffee, textiles, etc., but only for raw export.

According to the data released by the General Department of Customs, by the end of 2022, the total import and export turnover of the whole year will reach 730.2 billion USD, up 9.1% (equivalent to 61.2 billion USD) compared to the same period last year. This is a record number of Vietnam’s import and export activities. On the export side, Vietnam’s total export value reached 371.30 billion USD, up 10.5%, import was 358.9 billion USD, trade surplus was 12.4 billion USD. Notably, the total import-export turnover of enterprises with foreign direct investment (FDI) reached US\$506.83 billion, up 9.3% (equivalent to an increase of US\$43.2 billion) compared to 2021. FDI enterprises exported US\$273.63 billion, up 11.6% (equivalent to nearly US\$28.5 billion) compared to 2021, accounting for 73.7% of the country’s total export turnover.

It is clear that Vietnam’s import-export activities are too dependent on FDI enterprises. There are several risks that could be happened:

- + Economic dependence: When a country is overly dependent on foreign capital, the economy can become vulnerable to global financial fluctuations. If there is a change in the flow of foreign investment capital, the economy may face difficulties and bear significant risks.

- + Lack of diversification: Excessive dependence on foreign capital can reduce the diversification of the economy. If many important industries rely on FDI, the loss of other resources and development potential could create an imbalance in the economy.

+ Collateral to Power: In some cases, dependence on foreign capital can lead to the fact that foreign enterprises own and control a large portion of the nation's industry and resources. This can deprive the country of its independence and control over its resources and decision-making power over economic development.

+ Lack of capacity to improve domestic capacity: If a country is too dependent on foreign capital, it may lack investment and capacity to improve domestic capacity. The lack of investment in research and development, training of high-quality human resources and the development of domestic resources can reduce the competitiveness and sustainable development of the country.

In the future, when FTAs come into effect, import and export taxes would gradually decrease to zero and cross-border e-commerce platforms would dramatically climb. About the import of Vietnam, when cheap products from countries like China are available or high-quality products with beautiful designs from the EU and the US flooded the domestic market, Vietnamese enterprises hardly have a chance to compete. On the other hand, on the export side, FDI enterprises have a great advantage in the production of export products. Dr. Vu Tien Loc said that, in more than a third of a century, Vietnam's industry with the help and participation of 50% of the FDI business community, has basically just stopped at assembling and processing steps. It is clearly to be seen that the added value is not large. Moreover, domestic businesses always operate separately from each other and exist as "independent islands". In addition, it is also difficult for Vietnamese entrepreneurs to participate in the supply chains of FDI enterprises since domestic companies could meet the demand for high qualifications for FDI enterprises.

In conclusion, from the results of the analysis of the above 4 factors, we can see that the development of all 4 factors above is necessary. It is noticeable that the economic factor of Vietnam is incomplete, thereby researchers propose recommendations to overcome the above-mentioned weaknesses, especially in the development of the country's internal production resources.

5. SOME SOLUTIONS TO DEVELOP E-COMMERCE IN VIETNAM IN THE COMING TIME

- Technology solutions:

Firstly, Promote the construction and development of information technology and telecommunications infrastructure, reduce telecommunications charges and Internet access charges to increase access to everyone, and quickly deploy ADSL (Asymmetric Digital Subscribers Technology Lines), improve the capacity of the bandwidth.

Secondly, strengthening tax administration for organizations providing telecommunications services, advertising in the network environment, software products and services, digital information content products and services through domestic and cross-border digital platforms.

Thirdly, strengthening connection and data sharing between state management agencies and enterprises participating in e-commerce, building an e-commerce management database, applying risk management on a large database

Fourthly, Encourage and support enterprises to apply information technology to their business activities, improve the accessibility and use of e-commerce applications and solutions.

- Legal solutions

Firstly, finalize and submit for approval the Project on Digital Transformation of Industry and Trade, Digital Government of the Ministry of Industry and Trade.

Secondly, completing the system of legal documents on e-commerce, updating new regulations in line with the trends and advancements of information and communication technology, ensuring consistency and transparency and fairness in the management and regulation of e-commerce activities.

Thirdly, enforce a legal framework for electronic payments, establish a National Council on E-commerce, implement tax collection solutions for e-commerce activities, especially cross-border business activities to ensure the principles of fairness and transparency and to avoid tax loss and tax evasion.

- Social solutions

Firstly, the business side needs to raise the awareness and improve the computer and foreign language skills of the management team and employees in the company.

Secondly, strictly control model contracts, general trading conditions, and monitor defective product recalls and transactions in the e-commerce environment.

Thirdly, Implement Directive No. 30 of the Secretariat on strengthening the leadership of the Party and the management responsibility of the State for the protection of consumers' interests.

- Economic solutions

Firstly, Encourage and support Vietnamese businesses to build their brands and images in the e-commerce market. The Government should have policies to promote the production of Vietnamese goods, improve the competitiveness of Vietnamese goods, and reduce acts of selling pirated and counterfeit goods on e-commerce sites. Support campaigns such as: “Vietnamese people buy Vietnamese goods” should be usually held.

Secondly, introduce policies to attract domestic and foreign talents to build systems to control and assess the reputation of each wholesaler, retailer or product distributor on e-commerce platforms. Introduce a mandatory law to identify personal information as well as products to be sold, ... Completely using artificial intelligence or a secure operating system to reduce travel costs, checking transmissions systems, increasing accuracy, objectivity and universality to easily be widely used for the entire economy.

Thirdly, integrate trade promotion activities to develop the domestic market into consumer demand stimulus programs, initiatives to connect supply and demand of goods and well implement market stabilization programs. Support enterprises (especially small and medium enterprises, production facilities of craft villages, farmer households, cooperatives, etc.) in trade promotion activities; building and protecting brands for domestic wholesale and retail distribution chains; promote regional specialties and typical products of Vietnam.

Fourthly, promote international cooperation in the field of e-commerce, sign bilateral or multilateral agreements on e-commerce, support enterprises to participate in the international e-commerce market, especially especially big markets such as China, USA, EU, ASEAN

Fifthly, the current sales business is not only through e-commerce platforms, but also sales in many other forms such as selling via Zalo, Facebook, Instagram, etc. Therefore, the Government and the General Department of Taxation need to supervise and take measures to collect the arrear because sales methods through social networks are the best way to connect with the young generation and the sales are extremely enormous.

CUSTOMS MANAGEMENT FOR CROSS-BORDER E-COMMERCE ACTIVITIES IN VIETNAM

Authors: Nguyen Thi Kim Anh¹, Nguyen Thi Duong¹, Hoang Thi Ngoan¹
Mentor: Ph.D Nguyen Hoang Tuan¹

ABSTRACT: Cross-border e-commerce is an opportunity to promote the digital economy, a favorable environment for business models, and a bridge for Vietnamese enterprises to reach the big playing field. In the context of the strong development of Industry 4.0 and deep international integration, cross-border e-commerce is forecasted to develop even more strongly. However, the parallel development between traditional cross-border transactions and cross-border e-commerce, problems arising in cross-border e-commerce transactions pose many problems for state management agencies to solve, especially the customs office. Therefore, research on customs management for cross-border e-commerce in Vietnam is essential. This topic has focused on comprehensively solving both the theoretical basis, the world practice and the practice of Vietnam as a basis for proposing solutions to strengthen the state management of customs for trade activities. cross-border e-commerce.

Keywords: Customs, cross-border e-commerce, state management

1. INTRODUCTION

The Industrial Revolution 4.0 taking place along with the development of the digital economy has become the driving force for e-commerce to develop strongly in the world as well as in Vietnam. Especially in the process of deepening international economic integration today, with the increasing demand for commercial goods exchange between countries and regions, cross-border e-commerce is currently an area of great attention. important and attract many stakeholders.

Only appeared since the 2000s, cross-border e-commerce has grown strongly in the European Union (EU), North America and spread to Asia - Pacific and other countries around the world. gender. Cross-border e-commerce is considered to be the fastest growing sector of world trade. This is an inevitable trend of development in all socio-economic aspects in all countries in the globalization era. With the rapid development, universality and international payment, cross-border e-commerce brings great benefits such as access to information, exchange of goods, quick search for services for customers. goods in a borderless environment, removing geographical and time distances. Cross-border e-commerce is rapidly becoming a core element of the global economy and an inevitable trend that no country can stand outside.

For Vietnam, international economic integration has facilitated the development of cross-border e-commerce, creating opportunities for Vietnamese businesses to participate in this potential playground. In recent years, Vietnam's e-commerce market has been increasingly expanded. In the context of the Covid-19 epidemic, the e-commerce market is becoming more and more exciting when we implement distance and restrict travel, people's consumer buying habits also gradually shift from buying traditional goods to online shopping through e-commerce. At the same time, cross-border e-commerce helps consumers through the internet to shop in international markets and become "global consumers". According to the Vietnam E-commerce White Paper, in 2020, the growth rate of e-commerce will reach 18%, the scale will reach 11.8 billion USD and is the only country in Southeast Asia with the growth of e-commerce numeral 2 numbers.

¹ Academy of Finance.

After Covid-19 and in the coming time, e-commerce is an area that is assessed to have the potential to develop even more strongly.

Participating in deeper integration into the world economy means that Vietnam has to compete more and more fiercely with other economies in the world. Meanwhile, cross-border e-commerce in Vietnam is still quite new with many complicated legal and customs procedures. In particular, the customs authority plays a very important role in strictly controlling and complying with the law on border goods transactions, to ensure that the transaction takes place safely and smoothly as well as to ensure the safety and security of the goods and tax revenue. Besides, along with the strong development of the Internet, modern technologies and services were born, and bad objects through which to conduct illegal business activities. Customs authorities have a great role to play in preventing such acts, so enhancing the role of Customs is necessary in the current context.

With the above reasons, the study of the topic “*Customs management for cross-border e-commerce activities in Vietnam*” is extremely necessary for the customs industry, contributing to facilitate the operation of the Customs, import and export via cross-border e-commerce, especially in the current globalization context.

2. OVERVIEW OF RESEARCH SITUATION RELATED TO THE TOPIC

2.1. Research situation abroad

E-commerce and cross-border e-commerce are issues of common concern of the World Customs Organization, many other organizations and scholars around the world. Through the research process, there are a number of works related to the topic as follows:

APEC report “Capacity Building Research on Customs control of Cross Border E-Commerce” – 2016. The report focuses on research on improving customs control capacity with cross-border e-commerce by quoting, analyzing analyze the overall research on cross-border e-commerce, from the perspective of customs supervision and risk control, summarize the experiences and methods of cooperation among other partners, and propose effective measures to improve control capacity and improve customs work.

The article “The Development of Cross Border E-commerce” - 2017, by Feeng Ding, Jiazhen Huo, Juliana Kucht Campos, published in *Advances in Economics, Business and Management Research (AEBMR)*, volume 37, in *Proceedings of the International Conference on Transformation and Innovation in Management (ICTIM 2017)*. The article points out the driving forces behind cross-border e-commerce development and barriers, points out development trends, and offers some solutions for the government, merchants and providers who provide cross-border e-commerce services.

The article “Framework of Standards on Cross - Border E-commerce” - 2018, published by WCO, builds a common standard framework for cross-border e-commerce management based on the experience and collective knowledge of customs experts, government agencies around the world. The article points out the main principles and standards of cross-border e-commerce management from both the support and control aspects, in order to promote certainty, transparency, safety and security, efficiency in e-commerce supply chain as well as creating a level playing field for parties involved in cross-border e-commerce.

The report “WCO Study report on Cross - Border E-commerce” - 2017, WCO, points out the problems and challenges of customs management for cross-border e-commerce, and proposes a number of solutions across the border. Customs management practices in China, Hong Kong, the United States, the European region...

2.2. Research situation in the country

There are many research topics on e-commerce and cross-border e-commerce, but as far as our team understands and knows, there is not a single research topic or thesis that delves deeply into the role of Vietnam Customs in controlling cross-border e-commerce. Some works in Vietnam related to the scope of research such as:

Academic research project (2018) by a group of authors, Ph. D Nguyen Thi Kim Oanh, Ph.D Nguyen Hoang Tuan, and Ph.D Nguyen Thi Lan Huong, “State management of customs for cross-border e-commerce“, has generalized the issues of customs management for cross-border e-commerce, analyzed, assessed the current situation and proposed solutions to strengthen the state management of customs for cross-border e-commerce in Vietnam.

Dao Anh Tuan, “State management of e-commerce” – 2013, doctoral thesis at National Economics University. The thesis points out the theoretical bases and lessons learned in state management of e-commerce, the reality of state management of e-commerce in Vietnam, and points out some shortcomings that still exist, thereby proposing solutions to improve the state management of e-commerce in Vietnam.

MA. Hoang Thuy Linh, “Discussion on cross-border e-commerce management in Vietnam” – No. 10(195)-2019, published in Accounting and Finance Research journal. The article points out the challenges that management agencies face in controlling cross-border e-commerce and then proposes some solutions to the customs authorities.

General comments from the review of research works:

Although the above works have not mentioned in depth the role of customs in controlling cross-border e-commerce, there are also some contents that have mentioned the management role of customs in cross-border electronics. A number of scientific works, including reports from the World Customs Organization (WCO), have proposed a number of customs management methods for cross-border e-commerce activities. A number of Vietnamese scientific studies have studied the experience of some countries on customs management for cross-border e-commerce and suggested some solutions. The above works provide theoretical and practical bases for e-commerce activities in Vietnam and around the world. These are studies that play an extremely important role for our team to carry out this topic.

3. THEORETICAL AND PRACTICAL BASIS ON RESEARCH SITUATION

3.1. Theoretical framework

3.1.1. The basic concepts

➤ Ecommerce

E-commerce is commercial activities carried out through telecommunications networks, the Internet and through electronic means between groups (individuals) through electronic tools, techniques and technologies.

➤ Cross-border e-commerce

According to WCO – World Customs Organization: “*Cross-border e-commerce is international e-commerce. Literally means “cross-border buying and selling of goods by e-commerce”, as opposed to domestic e-commerce transactions*”. Combined with the concepts of e-commerce, it can be understood that cross-border e-commerce means online buying and selling activities through

the Internet that take place between different countries and territories, buyers and sellers are not in the same nation. For example, exporting lychee from Vietnam to the European market by means of cross-border e-commerce on Vietnam's e-commerce platform - Voso Global, or selling goods from the US to Vietnam...

According to the Standard Framework on cross-border e-commerce published by the World Customs Organization (version 6/2022), the characteristics of cross-border e-commerce are mentioned as follows:

- Orders, sales, communications and, where possible, payments are made online. Refund/return requests are made according to a strict process.
- The transaction / delivery of goods is carried out across borders with large volume but packed into small packages of goods.
- Goods exist in physical form (tangible) and the flow of goods is sensitive to time.
- For consumers/buyers (for commercial and non-commercial purposes). This includes people who do not know each other.

Thus, according to the above concept, cross-border e-commerce can be understood as ordering, selling, contacting exchanges online, and the payment can be online or offline and at the same time physical goods. images are transported across borders.

➤ **Customs management for cross-border e-commerce activities**

Customs management in English is Custom management. Customs management is the process of influencing the customs administration on the subjects managed by the customs authorities in order to ensure compliance with the regulations and set objectives.

State management of customs means the management of the State over the organization and operation of the customs authority and the export, import, exit, entry and transit activities of organizations and individuals. to direct those activities to develop towards certain goals and orientations.

In Vietnam's regulatory system, Article 99 of the 2014 Customs Law clearly states:

“Contents of state management of customs include:

- 1. Formulate and direct the implementation of strategies, master plans and development plans of Vietnam Customs;*
- 2. Promulgating and organizing the implementation of legal documents on customs;*
- 3. Guiding, implementing and propagating the law on customs;*
- 4. Regulations on the organization and operation of Customs;*
- 5. Training, fostering and building a contingent of customs officers;*
- 6. Organize the research and application of science and technology and modern customs management methods;*
- 7. State statistics on customs;*
- 8. Inspect, examine, settle complaints and denunciations and handle violations of the law on customs;*
- 9. International cooperation on customs.”*

Currently, cross-border e-commerce business activities are developing more and more widely, it is necessary to develop and issue regulations on customs management in this field. With the main task is to enforce customs laws and regulations related to import and export activities, collect taxes and facilitate quick clearance of goods while ensuring compliance with legal regulations.

3.1.2. Practical basis of customs management experience for cross-border e-commerce

The study refers to the experience of customs management for cross-border e-commerce in some countries around the world such as China, Korea, Canada, Australia, Indonesia, Turkey, Norway, and the United States. From the above experiences of other countries, the study proposes some experiences in customs management for cross-border e-commerce activities in VietNam as follows:

First, customs operations need comprehensive reform and modernization in the direction of synchronous use of the IT system and application of risk management, thereby allowing most of the work to be carried out automatically. automation, thereby both reducing costs and improving inspection efficiency.

Second, along with perfecting the system of legal documents as a legal corridor for Customs activities, the General Department of Customs continues to improve professional regulations and processes.

Third, proactively control the situation, detect, fight, prevent and promptly and strictly handle acts of smuggling, commercial fraud, and illegal cross-border transportation of goods.

Fourth, building and developing infrastructure for customs management for cross-border e-commerce should be built on the foundation of IT infrastructure and modern scientific applications. invest in IT infrastructure, apply modern technologies to provide online public services for cross-border import and export of goods.

4. RESEARCH METHODS

General Research Methodology: Methodology of Dialectical Materialism and historical materialism to consider and evaluate the research objects of the topic is related to customs management for cross-border e-commerce activities in the common relationship, in the movement and development, with the interdependence effect to properly appreciate the nature of things, phenomenon, evaluate the cause and state the measures of the research object.

The study uses the following specific research methods:

Synthetic analysis method: to inherit the theories related to customs management for cross-border e-commerce, thereby forming the theoretical basis for the topic.

Statistical analysis methods: Statistical analysis assesses the nature and movement trends of the research subjects.

Document research method: Analyze documents related to the research problem to build a theoretical basis, write an overview of the research problem.

5. RESEARCH RESULTS AND DISCUSSION

Assessment of the current status of customs management for cross-border e-commerce in Vietnam

5.1. These achievements

It can be affirmed that in the past time, the Customs sector has effectively implemented customs management for cross-border e-commerce, specifically:

Since 2014, Vietnam has promoted the implementation of the national single window mechanism. From April 1, 2014, providing level 4 public services, implementing e-customs procedures through VNACCS/VCIS system and electronic payment gateway and starting to connect with ministries and sectors implementing NSW. As of 2017, the National Single Window has officially connected with 11 ministries and branches. In addition to goods clearance procedures (Ministry of Finance), 47 administrative procedures of

10 ministries and branches have been carried out through the National Single Window with a total of more than 645 thousand administrative records handled. ministry, about 15 thousand enterprises participated. Along with that, in the past time, the Customs sector has sharply reduced administrative procedures in the field of management from 239 to 183 current procedures. In addition, the current administrative procedures have also been reviewed, simplified in terms of documents, applied electronic methods to shorten the time and cost of carrying out customs procedures.

Along with cutting and simplifying administrative procedures, with the goal of supporting and creating favorable conditions for businesses and people, the Customs sector has signed with 37 commercial banks to collect electricity tax and currently accounts for about 90% of the industry's budget revenue.

The General Department of Customs, as the standing body of the Steering Committee 389 of the Ministry of Finance, has advised the Ministry of Finance to coordinate with other ministries, branches and functional agencies in strengthening the fight against smuggling commercial fraud and illegal cross-border transportation of goods; directing units to seriously and effectively implement many important measures, in which focusing on the synchronous use of professional measures, strengthening coordination, regular inspection and control at the key areas, sensitive items... At the same time, the Customs sector continues to build and perfect the legal basis; improve the capacity of specialized anti-smuggling forces; invest in modern equipment and means. According to data from 389 national steering committees, in 2022, the Customs sector detected and arrested more than 16,000 cases of smuggling and commercial fraud, worth 5.8 trillion VND, collecting and paying more than 425 billion VND to the state budget. 6 billion dong. Customs authorities prosecuted 45 cases and transferred to other agencies to prosecute more than 112 violations.

5.2. Limit and reason

➤ Limit:

For cross-border e-commerce activities, it is also difficult to determine the revenue source and the object when the taxpayer does not have business registration and has no fixed business establishment. Foreign enterprises often refer to tax agreements and determine that they do not have a fixed business establishment in Vietnam, so they do not declare and pay corporate income tax.

Because it is difficult to determine the source of income and the taxpayer, the tax authorities also have difficulty in determining the tax base. Because in the digital environment, business activities can be carried out through a website that is present in a certain market area, without the need for the physical presence of taxpayers there. That leads to the creation of loopholes for businesses and individuals doing business through the Internet to take advantage of, causing loss of revenue for the state budget.

In addition, this activity also has many potential risks such as individuals and organizations taking advantage of cross-border e-commerce methods to carry out trading acts of banned goods, goods of unknown origin, counterfeit goods, and imported goods. imitations, goods infringing intellectual property, goods of poor quality, providing false information to deceive consumers...

In terms of legislation and policies related to e-commerce activities, the Government has issued relevant documents. However, the fact that cross-border e-commerce has been developing diversely, so these regulations are not really comprehensive and synchronous, many issues have not been mentioned, leading to difficulties. inadequacies in management. Moreover, the lack of a legal framework for e-logistics activities in Vietnam is also a significant obstacle.

Technology and the internet also facilitate criminal activities through illegal business activities. The Internet makes it difficult for criminals to detect violations and customs will also face many difficulties in managing and dealing with complex cyber-related crimes.

In addition, due to the specialization in customs management, there are few customs officers who are well versed in both areas of expertise and the ability to apply IT.

➤ *The cause of the restriction*

About the loophole in the legal corridor

Up to now, there is no separate legal document on tax administration for e-commerce. The provisions of the tax law for e-commerce are scattered in many different documents such as the 2005 Law on Electronic Transactions, the Law on Tax Administration and a number of Decrees and Circulars. Therefore, some provisions of the Law on Tax Administration, VAT Law, Law on CIT, Law on Personal Income Tax, Law on Import-Export Tax and guiding documents do not cover all subjects and forms of business. cross-border e-commerce business arises in Vietnam. Therefore, the propaganda and dissemination of customs and tax laws and policies have not been effective, encouraging organizations and individuals to practice fulfill tax obligations.

The responsibilities of postal units and express delivery businesses have not been clearly defined for the declaration of goods information

In fact, there are many shipments, postal businesses, and courier companies that do not describe the goods in detail, merely relying on sketchy information from the sender to fill out the customs declaration.

About the team of civil servants

In recent years, the annual recruitment quota for additional civil servants and public employees for units in the Customs sector is not much, in addition, every year a number of officials retire, so the staff The customs sector is decreasing day by day. The number of elderly cadres is large, the number of trained young cadres is still low, and their qualifications are uneven, so they cannot meet modern scientific and technological management.

6. PROVIDING SOLUTIONS AND RECOMMENDATIONS

To ensure the management of the subjects participating in the above-mentioned e-commerce transactions and at the same time facilitate and promote the development of cross-border e-commerce activities in Vietnam, the research team proposes specific solutions such as: after:

First, improving the legal basis for customs management activities for cross-border e-commerce

Vietnam needs to quickly build a cross-border e-commerce legal framework that is founded on the principles of good governance, fairness, and transparency, while responding to new and emerging requirements, as well as balancing by the diverse interests of all stakeholders in Cross-Border E-Commerce. Legal frameworks and legal regulations Cross-border e-commerce needs to be balanced between enhancing convenience while ensuring safety and security, and controlling physical (tangible) goods through the provision of prior data.

Besides, it is necessary to soon supplement, correct and complete the legal infrastructure for e-commerce in general and cross-border e-commerce in particular. It is necessary to review, supplement, amend and promulgate new policies and legal documents to support and facilitate the development of e-commerce and be in line with international practices and commitments. international relations of Vietnam. Legal documents related to the recognition of the legal value of electronic documents: Legal documents recognize the legal value of invoices and accounting documents in the form of electronic documents when meet specific standards to support enterprises in performing tax and accounting operations when implementing cross-border online purchase and sale of goods; Legal documents that recognize the legal

value of documents, applications and certifications in the form of electronic documents when they meet specific standards to support the implementation of part or the whole of the business registration process. business, investment registration, bidding and procurement via electronic means.

Second, simplifying customs procedures, customs and tax professional processes for cross-border e-commerce

Customs authorities should coordinate with relevant government agencies in establish a standardized framework for advance electronic data exchange between cross-border e-commerce stakeholders and Customs and other relevant government agencies to facilitate transacted shipments facilitate customs clearance. Establish a common set of terms and reliable mechanisms to accurately measure and analyze cross-border e-commerce on the basis of close cooperation with international organizations such as WTO, UNSD, OECD, UNCTAD, UPU, ICAO, WEF, World Bank Group, as well as with national statistical organizations and e-commerce stakeholders.

Third, training and developing human resources for customs management for cross-border e-commerce

Professional training and retraining for staff should be strictly regulated, and at the same time, the inspection, examination and testing of qualifications should ensure the correctness and rigor to avoid formal diseases or other standards. in the issue of training and fostering staff, leading to ineffective management.

Fourth, modernizing facilities and apply customs management IT to cross-border e-commerce

Modernize machinery and equipment for customs inspection, supervision and control; connecting the IT system with the use of modern equipment and machines, applying online technology, minimizing the intervention of civil servants in the inspection and supervision stages; invest, equip modern facilities to meet the application of customs management on the basis of technology application of the Fourth Industrial Revolution.

Fifth, promoting cooperation between customs authorities and other domestic and international agencies in cross-border e-commerce management.

should be established for advance electronic data exchange between cross-border e-commerce stakeholders and Customs and other relevant government agencies in order to facilitate the delivery of shipments. Customs procedures are carried out smoothly. Establish a common set of terms and reliable mechanisms to accurately measure and analyze cross-border e-commerce on the basis of close cooperation with international organizations such as WTO, UNSD, OECD, UNCTAD , UPU, ICAO, WEF, World Bank Group, as well as with national statistical organizations and e-commerce stakeholders.

7. CONCLUSION

This topic has focused on comprehensively solving both the theoretical basis, the world practice and the practice of Vietnam as a basis for proposing solutions to strengthen the state management of customs for trade activities. cross-border e-commerce. Specifically, the study has achieved the following main results:

First, in order to systematize and clarify the theoretical bases of cross-border e-commerce such as: Concepts, transaction forms, and the roles of actors involved in cross-border e-commerce.

Second, the topic has focused on understanding and clarifying the basic principles and standards of customs management for cross-border e-commerce. Analysis of factors affecting the management of customs authorities for cross-border e-commerce.

Third, the topic has synthesized the management experience of customs authorities for cross-border e-commerce of some typical countries in the world from which to draw some lessons for Vietnam.

Fourth, the topic has analyzed the context of e-commerce development in Vietnam and the current situation of cross-border e-commerce transactions in Vietnam in recent times. On that basis, specifying the legal basis and management method of Vietnamese customs for cross-border e-commerce transactions in Vietnam. From there, evaluate the achieved points, limitations and causes as a basis for proposing appropriate solutions.

Fifth, on the basis of analyzing and assessing the current situation of customs management for cross-border e-commerce in Vietnam in the period of 2018-2022, the topic has proposed solutions to strengthen the state management of the agency. customs for cross-border e-commerce.

THE INFLUENCE OF PART-TIME JOBS ON FFL STUDENTS' LEARNING ABILITY

Author: Nguyen Linh Chi¹

Mentor: MA. Dao Thi Oanh¹

ABSTRACT: *This study explores the influence of part-time job on a group of first- and third-year students of Faculty of Foreign Languages, Academy of Finance. The article aims to find out the number of students who are studying at FFL and doing part-time jobs at the same time. More importantly, it suggests some recommendations for FFL undergraduates who want to take advantages and overcome their disadvantages if they want to apply for good positions in the future and ensure current study plan. To achieve this goal, the authors used a variety of data collection instruments (such as questionnaires, telephone interviews) and different methods like data analysis, and information synthesis to assess whether their opportunities are high or not. Based on the findings, the study argues that FFLers are students with effective learning and work-balancing approaches.*

Keywords: *learning ability, part-time jobs, learning, influence of part-time job.*

1. INTRODUCTION

In the context that the industrial revolution 4.0 is gradually becoming popular and developing strongly in most countries around the world, Vietnam is not an exception to that development with increasingly strict requirements for team quality. Students need to make great efforts to constantly accumulate knowledge and experience in order to get a suitable job after graduation so that they can compete in the increasingly open labor market. Therefore, to become a promising generation for the country, students must be fostered in parallel between knowledge in the classroom and skills and experiences from practice. One of the ways that most students think they can gain the most experience is from doing part-time jobs outside of school hours. This is a way for students to earn extra money to meet their basic needs, reduce financial stress on families, and provide opportunities for students to gain more work and real-world experience. For the above reasons, the author would like to conduct research titled: ***“The influence of part-time jobs on FFL students’ learning ability.”***

The research aims at: First, investigating the academic ability of FFL students of the Academy of Finance as well as the current situation of taking part-time job among FFL students. Secondly, finding out the influence of part-time jobs on students’ learning ability. Finally, giving some recommendations to the problems that students encounter. The study was conducted at the Academy of Finance with 104 students in particular. In which, 100 students, including 40 first-year students and 60 third-year students, participated in the survey to answer questionnaire. The rest 4 students, including 2 freshmen and 2 third year students, participated in the interview. The survey was conducted from December 13 to December 25. The study was conducted from December 13, 2022 to January 13, 2023.

2. THEORETICAL FRAMEWORK

2.1. Part-time jobs from the perspective of social organizations and communities

2.1.1 Definition of part-time jobs

According to Market Business New (MBN), the term part-time job describes workers who work fewer hours in a day or week than full-time worker. The term can apply to work and jobs, as in “I work part-time” or “I have a part-time job”.

¹ Academy of Finance.

Besides, Woodhouse (2017) states that a part-time job simply involves working fewer hours in a week than a full-time job. Often, part-time jobs involve working in shifts. These shifts are usually rotational with other part-time workers. The same as Woodhouse, Culver (2022) also defines the term part-time job is working in a fewer hours than full-time worker but more detailed. Culver (2022) states that: Part-time jobs typically require no more than 35 hours per week, and may be as few as 5-10 hours. Unlike full-time employees, part-time employees are not guaranteed the same number of hours or shifts each week.

However, the number of hours in a full-time job varies among countries and also from employer to employer within countries. Because of this, there is no universal definition of how many hours make up part-time work, except in relation to full-time. The government of the United Kingdom, for instance, define a part-time worker simply as “someone who works fewer hours than a full-time worker.” The International Labour Organization (ILO) also defines the term in relation to full-time. According to the ILO, part-time workers are those “whose normal hours of work are less than those of comparable full-time workers.” Besides, part-time job is described in Article 32 of Vietnam Labour Law 2019, in which the employee and the employer agree on working hours that are less than normal working hours in days, weeks, or months.

In addition, for students, “part-time job” is working while still attending school in firms, organizations, units, and families that are not prohibited by law and do not have a significant impact on learning... to earn more money or to improve soft skills for the process of living and working, as well as to get experience closer to real life. Part-time jobs have become popular because, for students, especially in today’s competitive environment, social awareness and practical knowledge have a significant impact on their capacity to work, think, and work after graduation.

So, in this study, “part-time job” refers to an informal, irregular job in addition to another secure job; for students, the official job is to attend school. Part-time jobs, internships, and other social activities are examples of informal jobs.

2.1.2. Kinds of part-time jobs

For part-time jobs that require high quotas, which means a lot of work, it will lead to overload on both the health and the ability to receive knowledge of students. Students will no longer be in the best state to study and of course, their academic results will be reduced. Muluk’s research (2017) has identified the “type of part-time job” that has a certain impact on the learning outcomes of learners. The question is, if students choose a job related to their field of study, which gives them skills and experience, offsets and helps students’ learning at school, will “the part-time job” has a positive effect on student learning outcomes? Paolo and Matano (2016) concluded that a part-time job unrelated to the field of study will have a negative effect on academic performance, on the contrary, a part-time job related to the field of study will bring about positive impact on student achievement. Part-time work is comparable to full-time work. Part-time jobs for college students are classified into the following five groups:

(i) On-campus positions

Working on-campus allows students to collaborate with their peers while also developing professional ties and networks for your future job. With an on-campus job, students will have more flexibility in changing their working hours because they will be determined only by their class calendar.

Students can participate in a variety of school activities connected to the knowledge they have gained with this type of study. As a result, students have several opportunities to form relationships with teachers and gain new knowledge faster with classmates. Participating in this employment, however, means that students cannot participate in off-campus jobs to gain other skills.

(ii) Retail and marketing positions

Local boutiques, e-commerce, and social media are all examples of retail occupations. Working in a physical store can give students with vital human and workplace skills that students can apply later in your professional career. Similarly, working in an online position can provide students with technical skills such as business analysis, which will help students stand out from the crowd when applying for jobs in their desired industry. Numerous brands rely on social media to gain business and notoriety and are hiring online candidates to do so. Apply for part-time social media management positions if you have social media talents such as content creation on YouTube or Instagram.

This is a specific form of office employment in which students can polish their intellectual talents while also gaining experience in the field of marketing. Unfortunately, because this form of work is only part-time, the amount of labor and expected compensation are frequently not fulfilled by the students.

(iii) Food-service jobs

Students can earn tips in addition to hourly income if they work in the food-service industry, which includes restaurants, cafeterias, and catering companies, among other businesses. This is especially useful during peak hours and holidays, when their earnings may be larger than usual.

Food service jobs are typically manual labor occupations, so students will obtain the necessary soft skills when talking with clients. Professional and academic credentials, on the other hand, are frequently overlooked in this employment field.

(iv) Paid internships

Make the most of students' part-time college job by taking advantage of a paid internship that can help them enhance their resume with relevant experience. Most paid internships are completed during the summer, so they can supplement their normal part-time job and help them survive the rest of the academic year. A paid internship may provide them with the following benefits: quality references for students' resume, potential future full-time employment prospects, a higher-paying position after graduation, and a new skill set to take with students into your career. Paid internships also demonstrate initiative and ambition, which many employers respect.

(v) Freelancing

As a college student looking for part-time job, the present "gig economy," as some refer to it, works to students' favor. It's quite convenient if students want to work during their own, flexible hours, from babysitting to opening their own online shop on sites like Shoppe, Tiki or Lazada. If students have babysitting, cleaning, or pet-sitting experience, turn it into money by starting their own small business.

Doing a part-time job while attending college demonstrates that students are a hard worker. It will assist students in developing a skill set that students will bring to their profession and beyond. These abilities include, among other things, time management, communication, and problem-solving. Take use of this opportunity to explore their interests, properly prepare for their profession, and broaden their portfolio and character while taking control of their finances.

2.1.3. Law on part-time labor in Vietnam

Part-time labor or part-time job is defined as such in labor law, specifically in Article 32 of the Labor Law 2019, which states: "Employees work without full-time means an employee whose working time is shorter than the normal working time in days, weeks, or months as prescribed in the labor law, collective bargaining agreement, or internal labor regulations." When the labor contract is signed, the employee and the employer will agree to work part-time. Part-time employees are entitled to salaries, same rights and obligations with full-time employees, equal opportunity, non-discrimination, and occupational safety and hygiene.

(i) Social insurance for part-time workers.

Part-time employees will be entitled to social insurance contributions if they enter into one of the legally required contracts for social insurance participation. Article 2 of the Law on Social Insurance 2014 specifies the following provisions:

“1. Vietnamese citizens who are qualified to participate in mandatory social insurance include:

a. employees under indefinite-term labor contracts, fixed-term labor contracts, seasonal labor contracts, or for a specific job with a term of 3 full months to less than 12 months, counting the entire labor contract signed in accordance with labor law between the employer and the legal representative of the person under the age of 15;

b. Those employed under labor contracts lasting from one full month to less than three months.”

(ii) Social insurance contributions for part-time workers.

Insurance rates for part-time employees are comparable to those for full-time employees. The level of social insurance rate payment will be equal to the employee closure rate multiplied by the wage used as the foundation for social insurance payment.

According to the Social Insurance Law of 2014, the payment rate for employees who participate in social insurance is as follows: Workers who fall under the scope of Section 1, Article 2 of the Social Security Law of 2014 must pay 8% of their monthly earnings on a monthly basis.

(iii) Sanctioning for businesses who do not engage in employee health insurance

Regulations on sanctioning of violations are regulated by Decree 28/2020 on penalties for administrative violations in the field of labor, social insurance, sending Vietnamese workers to work abroad under contracts and regulations. determined as follows:

1. Employees who bargain with employees who do not engage in compulsory social insurance will face a fine ranging from VND 500,000 to VND 1,000,000.

2. Employers that fail to provide correct, full, and timely information and papers connected to the payment and enjoyment of compulsory social insurance may face fines ranging from VND 5,000,000 to VND 10,000,000. Obligatory according to the requirements of competent state agencies and social insurance agencies.

3. Employers who have failed to pay required social insurance and unemployment insurance but have not yet been prosecuted will face a fine of between VND 50,000,000 and VND 75,000,000.

2.2. Current limitations of students when taking part-time jobs.

Several students confirm, based on their personal experiences, that a part-time job has an enormous purpose as well as important long-term rewards. Many other subjects, on the other hand, consider that working part-time has numerous risks, including disastrous outcomes for young people. Here are some of the most typical limitations that students experience when working part-time:

2.2.1. Indifference, careless attitude

Some students prefer to work part-time in order to obtain more experience in the area, while others do so in order to make ends meet. Because the employment is just part-time, most students have little focus and spend their time in part-time occupations. As a result, many students are disinterested and unprofessional when participating in extracurricular activities. Although their internship report outcomes in terms of attitude are highly welcomed, it can be noticed that they need to further cultivate that attitude when going to work.

2.2.2. Lack of practical experience

While a lack of work experience hurts a student’s job preparation, there are numerous things students may do to prosper, such as learning and collaborating remotely. The pandemic has instilled in young people

resilience, communication, and adaptability, all of which will be useful in the workplace. Employers should not expect to see traditional elements on a student's CV, such as work experience. The evaluation of students' practical skills is separated into two parts. To begin, pupils with a lot of experience will be evaluated as having a good social engagement history; yet, some firms will grade these employees as "soon hot, soon cold" people. Second, someone with no work experience is less likely to be prioritized for CV screening and interviewing. Case two will be met frequently when students look for part-time jobs. As a result, students' lack of practical experience is viewed as a hindrance while searching for jobs.

2.2.3. Limits on professional knowledge and foreign language

Foreign language fluency is required when applying for a job. Knowing at least one foreign language will help candidates stand out and quickly acquire a job that matches their skill, level, and information search in the midst of the trend of the "multi-nationalization" of firms. Several desirable opportunities will be filled through recruitment. Learning a foreign language must serve its intended purpose of promoting the healthy study, work, communication, and entertainment.

As a result, internships are an excellent way for students to get through difficult recruitment rounds and were not startled when they started working. Because the internship is the greatest time for students to get experience in the sector of their choice, the internship process is similar to that of a new employee in the company.

19% of employers value the background information that students acquire during their university training, from agencies and organizations they have attended, certificates and degrees they have acquired,... and, of course, they must be relevant to the post for which the candidate is applying. As a result, professional knowledge and foreign languages must be developed so that they do not negative impact students' job applications after graduation.

2.3. Overview of learning ability

2.3.1. Definitions of learning ability

According to the English Dictionary, "learning ability" is the ability to comprehend. While learning anything generic, this is a typical concept to clarify learning ability. According to Billett (2012), workplace learning typically refers to the processes of learning through and for paid employment: on-the-job learning or learning via work. Learning ability at workplace, as a concept, highlights that specific contributions to individuals' learning are offered and secured by participation in work activities and interactions inside workplaces or work practices.

However, Velickovic (2019) states that there are other interpretations and definitions of learning ability at workplace that imply some kind of vocational training for high school students, university students, and unemployed people, or definitions that do not indicate the "learner's" working status, i.e. do not emphasize this element as crucial to the definition of the term: "A period of time in which a student works for a company to obtain information and experience."

Thus, there is no comprehensive definition of "learning ability" on which everyone can agree. "In the workplace, information or skills are acquired through formal or informal means... It incorporates both official and informal on-the-job training "according to the ILO (2009). Therefore, the first definition sees learning ability as activities of acquiring knowledge and skills that are organized and clearly defined as such, while the second definition, besides formal, also includes informal learning activities.

2.3.2. Possibility of hands-on learning through part-time jobs.

Many students find actual work through part-time occupations, according to Mr. Pam Caplin (a former vice president of human resources in the United States). "If they have the talent and integrity, they will

perform well in whatever job.” Mr. Pam also stated that students who have many part-time jobs will benefit greatly from “beautifying” their formal employment application.

When you decide to take a full-time job, remember to factor your part-time work experience into your application. These are the important factors that will make your application “stand out” from the crowd. According to Ms. Marry Gibbs (HR recruiter with 12 years of experience), “When assessing job applications, I always pay special attention to applications containing a s since they help your application “stand out” from the crowd. Why am I so concerned? We need practical experiences, not theoretical sentences “ripped” from books”. As a result, in order for students to master self-study and reach particular goals, they must be familiar with the following skills:

(i) Good communication ability

Whatever career you pursue, the ability to communicate with coworkers, exchange and cooperate in work, and report to superiors is an essential talent. This is one of the most critical talents to have if you work in customer service. The secret to developing loyal consumers and boosting the business’s reputation is to treat clients with respect and politeness.

(ii) Ability to Use Technology

Most industries value the ability to use modern technological goods efficiently. Acquiring technical skills while working part-time will provide you with valuable real-world experience that you can utilize in the workplace. In your CV, don’t forget to mention the software system or equipment you’ve used, such as the POS system at retail outlets or office equipment like printers and fax machines...

(iii) Responsibility

Working responsibly and dependably is a significant skill that you should highlight in your CV. It also demonstrates that you are prompt, flexible, complete tasks on time, and are eager to improve your performance.

2.4. Previous studies on the influence of part-time jobs on students’ learning ability

Budget (1987) said that “Many of the students work a second, part-time employment. And why is it vital to have a part-time job?” Because a part-time job allows you to gain valuable work experience, enhance a variety of skills, and supplement your income while you are still in school. Ali (2017) said that “Part time job could bring extra income and help university students to gain working experience. But students may feel sleepy and reduce the time from the study, thus it is a real challenge to balance between a part-time job and study.”

The part-time job has two sides to it. First of all, the students will have many problems related to their studies. They no longer spend a lot of time going to school and studying, instead skipping classes just to work part-time. This has a very serious impact on your results. Friedas (1951) said that “Most of their reports on the disadvantages were joined with advantages which frequently outweighed the unsatisfactory aspects of having part-time employees. Had this not been true, these experienced employers would probably have abandoned part-time arrangements long before the survey was made.”

So part-time jobs are not necessarily the first priority, it is just time for you to experience different types of jobs before graduating from school and going to work officially. Not a single employer will accept your transcripts below good. It is not that you need to have a lot of experience, but you need knowledge related to the position that the company they are looking for.

According to research by Fineshriber (1980), the analysis of the influence of part-time work on students’ learning is surveyed through three main factors: Gender, difficulties in accessing part-time jobs

and finally is the benefits and reasons of looking to part-time jobs. Fineshriber stated that there were two factors of students who were able to achieve a good performance. Those were the intelligence capabilities of students and the type of students' work in which the job which was relevant to students' majors and could improve the students' academic achievement. Based on some research which has been explained above, shows that taking a part-time job may have a benefit in learning. The researcher finally chose the research about the influence of taking a part-time job on the student's learning ability because the researchers that interested there is some influence of taking a part-time job which is relevant to the students' major in this case, is either it would be the positive or negative influence towards the students' learning motivation.

Vietnam's economy has been changing, leading to a change in the labor market. It is forecast that the labor market in the coming time will change and greatly increase job opportunities for trained workers. Industries that use a lot of labor and have low skills will gradually lose their competitive advantage. Part of the low-skilled workforce will be eliminated and replaced by people with skills and good working attitudes. Therefore, in order to enter the extremely harsh labor market, to pass the entrance exams, students need to actively equip themselves with professional knowledge, professional skills, and the right professional attitude.

3. RESEARCH METHOD

The study has employed some research methods as main means for fulfillment. The first one is the literature research to clarify some definitions that refer to part-time jobs, learning abilities and some solutions to solve. The writer also uses quantitative and qualitative methods to analyse and summerise the documents. In addition, the participants includes 100 FFL students for questionaries and 4 students answering interview questions.

3.1. Questionnaire for students

Self-completion questionnaires were useful way of collecting data. This method could bring some benefits, such as: they are cheaper to administer especially when the sample is widely dispersed then one uses postal service; they are quicker to administer since many people can filling them at the same time; Respondents have some autonomy to respond the questions which avoids biases the come in when you have to talk to particular individually.

There are three major sections of the questionnaire. The first section of questions 1–3 is a handwritten question containing personal information about the participants. The information in this part assists the author in categorizing and analyzing the results. The second step is to check the box to see if the subjects have worked part-time or not. Questions 1 and 2 are two questions that inquire about the income of target groups. Question three is a subjective inquiry used to determine whether or not the person has worked part-time. The third section is a question section for the target groups that have checked the "YES" box. Questions 1–3 are mostly concerned with income and the sort of work performed by the target population. This information is especially crucial since it will allow the study to better understand the development of group behaviors later on. Question 4, 5, and 6 were regarding the influence of part-time job on students, which is also necessary to assist the author in conducting research and providing particular statistics. Question 7 is a one-of-a-kind inquiry about the advantages of part-time work for students. Subjects must answer this question by hand in order to express their personal opinions. Question 8 reverts to the check-in kind of response regarding the necessity of part-time work for students. The information in this question assists the author in providing further ideas for a more in-depth discussion.

3.2. Interview

According to et al (habib 2014) Harish et al. (1999): “*Interview is the verbal conversation between two people with the objective of collecting relevant information for the purpose of research.*” Researcher collects research data from both the primary and secondary methods. Researcher collects the primary data by taking direct interviews with different institutions students. In this interview, researcher ask questions to the participate students about the research topic.

The interview method of data collection also saves money; nevertheless, the researcher must analyze the record and ask suitable questions for each case. The interview question segment is divided into two sections: an introduction (name, age) and the main part (a question related to the topic). Two freshman and two third-year students were chosen to participate in the interview question for the introductory question. We also requested income information from three other third-year students. The research for the second question is focused on three primary questions. The first question sought information on whether or not students had worked part-time. The second question was about what to do in the survey if the student has a job; what is the job’s name? The third question will be about the purpose of employment and how part-time job affects pupils.

4. RESULTS AND DISCUSSION

4.1. Results

4.1.1. Current situation of FFL students’ part-time jobs

Currently, students’ part-time jobs are a common problem in society and there are many domestic and foreign studies investigating the positive and negative effects of this activity as either a living (Manthei & Gilmore, 2005), while these two aspects interact with each other. Up to now, not many studies have been found to fully explore the effects of part-time work on both academic and student activities (Wang et al., 2010).

Students working part-time at the Academy of Finance in general, and the Faculty of Foreign Languages in particular, are now a typical occurrence. According to studies and queries, the majority of students have worked part-time since they were freshmen. Furthermore, students working part-time are no longer an uncommon source of concern in this day and age. More importantly, whether or not students have part-time occupations that impair their academic performance is a major worry. Students are regarded as a healthy workforce, regardless of their knowledge or health, and can pursue any relevant job. Currently, many students are looking for part-time work for a variety of reasons, indicating that the demand for part-time jobs for students is extremely high.

Additionally, the Academy of Finance has implemented a training program in accordance with credit requirements, allowing students to be more engaged in their studies. There is less time to attend to class than previously, and with society’s increasing demands, students must be more active in equipping themselves with knowledge and abilities that they cannot gain in the classroom. Part-time work, on the other hand, will almost surely have an impact on students’ learning, because no matter what job they do, it will eat up a substantial part of their schooling time spent studying.

It can be seen that there are numerous types of part-time work, such as part-time work, and the recruitment procedure varies based on the position, so students at FFL may be certain of finding a job that meets their needs. Students work part-time and earn a consistent monthly income that helps them to fund living expenses, education, and other necessities. Jobs that are “not in the correct major” are typical among FFL students in especially. The great majority of students are involved in English-related jobs for

the goal of applying for jobs and earning extra money. Teaching assistantships and tutoring are two jobs in which many FLL students participate. These two careers are in high demand because the nature of the work necessitates the use of English, and English is a strong suit for FFL students. Joining two professions related to education, on the other hand, is not exactly consistent with the major of “English for Accounting” that FFL students learn. “In fact, students who graduate from the Academy of Finance have jobs for up to 98.39% of them after one year of graduation,” according to the findings of an Academy of Finance graduate survey. Main. In addition, “the Faculty of Foreign Languages is the only unit within the Academy of Finance that obtains 100% of the student employment rate after one year of graduation if measured based on the entire number of students responding to the graduation survey,” according to the FFL. To attain this rate, the vast majority of students in the Faculty of Foreign Languages have a strong command of the English language and have been working on it since their freshman year. Consequently, the fact that FFL students work part-time is widely accepted and valued during their studies at the Academy of Finance. But, this is also a reason for the article, which will look into the academic progress and impacts of part-time work on foreign language students at the Academy of Finance.

The survey results on the current situation of part-time employment

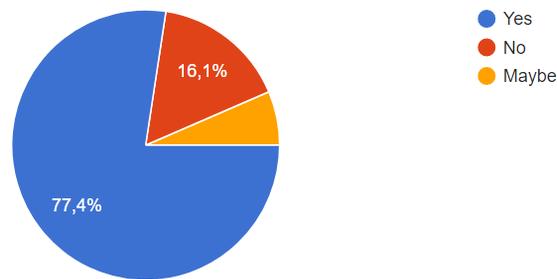

Figure 4.1. The current situation of part-time employment

(Source: Questionnaires result)

Figure 4.1. depicts data on the student group that is related to the current status of students’ part-time work. Based on the graph above, we can see that the total number of students working part-time accounts for 77.4% of the total. This figure demonstrates that surveying and evaluating students with a high number of part-time jobs is appropriate. 16.1% of students have never worked part-time before or had previously worked part-time but are currently unemployed. In general, the graph above plainly illustrates that students working part-time account for the vast majority of the total.

Students’ kinds of part-time jobs

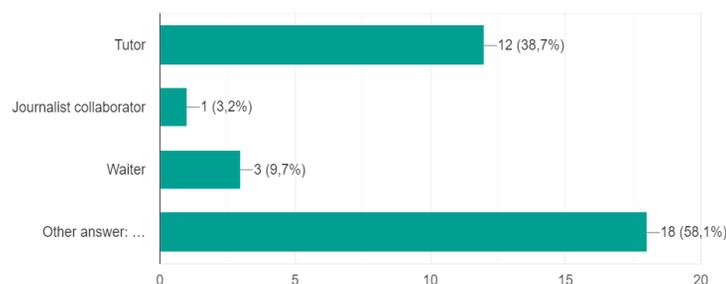

Figure 4.2. Students’ kinds of part-time jobs

(Source: Questionnaire result)

Figure 4.2 depicts the content of “part-time student work,” which includes three major job types: tutor, journalist collaborator, and waiter/waitress. The percentage of students working part-time as tutors is 38.7%, indicating that part-time students mostly employ English abilities for the purpose of this job. Yet, 9.7% of FFL students chose a waiter or waitress employment, indicating that the vast majority of FFL students focus on English-related knowledge and skills rather than participating in other occupations other than manual labor. Students working in various vocations such as teaching assistants, English teachers, and so on account for 58.1% of the total. In general, picking a vocation for part-time work is something that FFL students should think about in order to complement their strengths and, more significantly, link to the industry they are studying.

In terms of when students began working part-time, the majority of students in the poll began working part-time in their first and third years. According to the findings, part-time job is one of the most popular activities in the lives of freshman. Part-time work may be one of the variables for freshman to struggle with learning.

The amount of time spent on part-time job by students

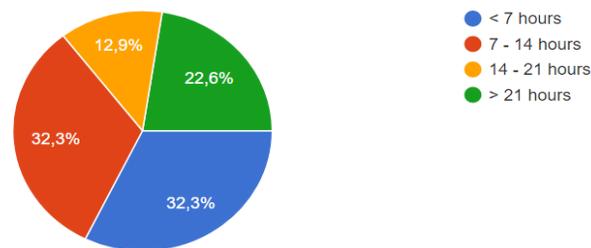

Figure 4.3. The amount of time spent on part-time job by students

(Source: Questionnaire result)

Figure 4.3 depicts the amount of hours students spend working part-time in a week. Overtime work of 7 to 14 hours and less than 7 hours is clearly shown in Figure 3. This means that students must devote at least 3-4 hours each week to part-time work. This quantity of time does not equal the time allotted for the complete work week. Nonetheless, students who worked more than 21 hours accounted for 22.6% of the total. This demonstrates that students labor for more than 20 hours each day, and more particularly, 4-5 hours every session. As a result, students can nearly always work around their academic schedules. The remaining students, or 12.9%, work between 14 and 21 hours every day. This demonstrates that the number of students working during this period is fixed, ensuring that good goals for study and work plans are met. In general, we can observe from the table above that students work part-time for nearly half a day per day, or 4-5 sessions per week. This working time almost has an effect on the cause and purpose of the student’s part-time job.

4.1.2. Reasons that students take part-time jobs

The majority of students choose to work part-time to earn more money to spend (51.6%); it is not specified what the expenditure is here. This finding indicates that students work part-time to supplement their income and assist their parents while attending the Academy of Finance. The students in the survey are of adult age (19-22), so they want to assert themselves by earning an income; additionally, most university students must live far away from their families and must rent dormitories or boarding houses, so spending on daily living expenses is necessary; specifically, most students use part-time wages to spend on personal activities.

Reasons for students to work part-time

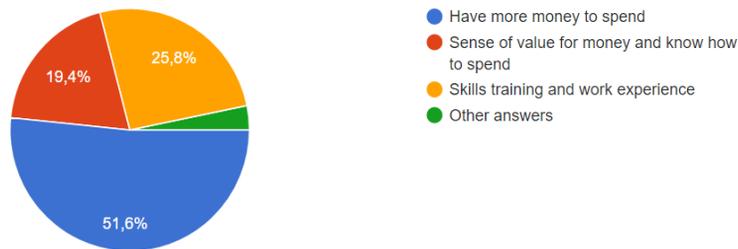

Figure 4.4. Reasons for students to work part-time

(Source: Questionnaire result)

The second reason is to carefully study the value of money in order to use it. By the experiences gained by students, this is regarded a once-in-a-lifetime opportunity. According to the findings, 19.4% of students select this path, partly for financial reasons, but primarily to gain experience for their future lives. Meanwhile, 25.8% of students worked part-time jobs to get more experience, as well as experience itself. It can be seen that this rationale is not appealing to freshmen owing to the age of pupils who have just started school and want to learn new things. The majority of students that choose this reason are third-year students who want to improve their Resumes and future job objectives.

But so far, the reason students go to work is also related to their choice of a part-time employment (Figure 4.2). The majority of students who choose to work in other businesses do so to earn extra money to spend. The rest of the profession’s occupations, such as teaching assistants, tutors, and teachers, all emphasize the necessity to get more experience for future objectives. The results of students’ part-time jobs show that the jobs that students choose to work part-time are very diverse; one reason could be that the student’s place of residence, study, and work is located right in the city center of Hanoi, where there is a high demand for food, entertainment, and learning services, and these part-time jobs do not require a high level of expertise. According to the results of information sources used to find part-time jobs, the two primary sources of information utilized by students to hunt for part-time jobs are introductions from friends and family and internet information sites. This is what relevant units must focus on in order to strengthen student support activities.

4.1.3. Attitudes of students’ family toward part-time jobs

One of the issues that parents have when their children reach their adolescence is whether to send their children to work. Aside from the obvious advantages, many parents see part-time work as posing several threats to their children’s education. Youngsters desire to work part-time not only to earn extra money, but also because they are enthusiastic and curious about life beyond the home and want to try new tasks that have never been done before.

Sending children to work at a young age, according to Dr. Bui Hong Quan, Scientific Advisor and Senior Professor at the Viet Idea Spiritual Care and Training Center, will help teach positive values. “Allowing youngsters to work will help them learn the importance of labor, resulting in an appreciation for labor and a positive attitude toward work. They will have a strong drive to work from a young age.”

Furthermore, the examination of the preceding graphs reveals that kids who work part-time are encouraged to work by their parents in order to have a better understanding of and appreciation for the value of money. Furthermore, students in their first and third years are no longer under the jurisdiction of their

parents, giving them the chance to experience student life while working at their favorite jobs. As a result, whether or not parents send their children to work appears to be more of a psychological issue. In general, the fact that students work part-time for valid reasons makes their parents entirely supportive of the idea.

4.1.4. The influence of part-time jobs on students’ learning ability

4.1.4.1. Advantages

Positive effects of part-time work on students’ learning activities

Students’ part-time occupations have a good impact on their learning activities. Part-time employment for students have a good impact, according to the facts below, because students can learn a lot in the workplace (69%), jobs relevant to the profession that students are studying, such as English listening and speaking abilities. Furthermore, when students were asked to choose one of the most essential perks in the job, soft skills accounted for 22% of the total.

Response sheet for interviewing students about the advantages of working part-time while studying.

I realize, working part-time helps students.....
have money to go to school
more reasonable study time management
to practice the knowledge learned in school
have money to pay tuition fees
get higher scores when working overtime in reasonable time
get better GPA in relevant subjects

Table 4.1. Advantages of working part-time while studying.

(Source: Interview result)

According to the preceding data, the majority of students profit from part-time jobs at enterprises. It is worth emphasizing, in particular, that the forms of professional work help students improve study skills more successfully. GPA summaries illustrate that curriculum-related subjects are applicable in both school and the workplace. The fact that students report that their school grades remain similar while working part-time accounts for the majority of the data in the table below:

Effect of part-time jobs on students’ GPA

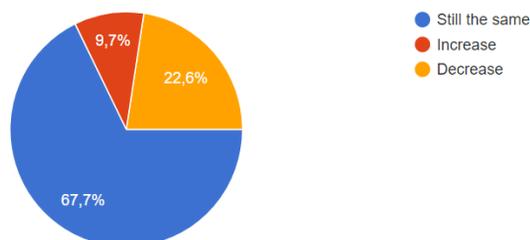

Figure 4.5. Effect of part-time jobs on students’ GPA

(Source: Questionnaire result)

Figure 4.5 illustrates that the impact of part-time work on students’ GPA is still beneficial. The score remains constant, accounting for 67.7% of the total, indicating that the student’s part-time work has little impact on the academic performance. Those who worked improved their grades, and academic performance accounted for 9.7% of the total. In general, the proportion of students who work part-time has a beneficial effect on student learning. It follows that the students’ academic performance remains typical even when they work part-time. This outcome is comparable to Muluk (2017) in that students’ scores remain above

average despite working part-time, however with part-time job ranging from 20 to 30 hours per week, students’ graduation time is extended.

Positive effects of part-time jobs on students’ daily activities

Table 4.2 illustrates that part-time job improves students’ personal, family, and social lives. The strongest positive impact on personal activities, in particular Part-time work, in particular, allows students to save money for personal needs (dining, playing, entertaining, etc.) while also making effective use of their leisure time. This study’s favorable effects on students’ personal life support the findings of Long (2009) and Wang et al (2010). Part-time employment has a somewhat favorable impact on the student’s family life. This result is comparable to Long’s (2009) because working part-time allows students to support their families while also receiving greater attention from them.

Part-time job has numerous positive benefits on students’ social activities, with manifestations such as a student becoming more confident in speaking with others, improving communication and behavior with others in daily life, and making more new friends. As previously stated, Long (2009) and Wang et al. (2010) investigated these positive impacts. Students, on the other hand, receive minimal attention from coworkers, peers, and teachers when working part-time. Part-time work has numerous good benefits on students’ job chances after graduation, especially in helping students gather skills, knowledge, and experience in many different disciplines, in addition to the favorable effects on personal, family, and social activities. This study’s findings are consistent with prior research (Long, 2009; Wang et al., 2010) on the association between part-time occupations and students’ career options.

Positive effects of part-time work on students’ daily activities in Table 4.2.

I realize, working part-time helps students.....
have money for personal expenses (eating, playing, entertainment)
make good use of spare time.
have money to support the family
become more confident in communicating with people
improve communication, how to deal with others in daily life
have more new friends
get more attention from colleagues, friends and teachers

Table 4.2. Positive effects of part-time work on students’ daily activities

(Source: Interview result)

Part-time jobs for students have a good impact on their daily activities in general. Incidentally, the typical student income nowadays is higher. Many students with an average wage of more than 1,500,000 VND have a rate of 61.3% due to the nature of the employment as well as outstanding professional abilities (Figure 4.6):

Student’s salary in 1 month

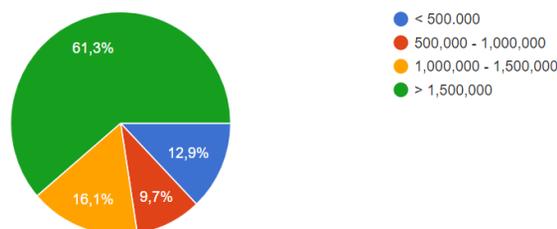

Figure 4.6. Student’s salary in 1 month

(Source: Questionnaire result)

Figure 4.6 displays the release of monthly earnings information for students. According to the above figures, 61.3% of students have an income of more than VND 1,500,000 each year. This demonstrates that students may adequately cover their ordinary living expenses while studying. 9.7% of students had salaries ranging between VND 500,000 and 1,000,000. This equates to an average student earning more than VND 500,000. This sum is sufficient to pay living expenses for students. Part-time work allow students to nearly completely offset their parents’ expenses.

Positive effect of part-time job on job opportunities of students after graduation

Part-time jobs assist many students in achieving particular accomplishments and aspirations after graduation. When students add part-time work experience on their Resume, employers will undoubtedly take notice, especially if students are competing against a large number of other candidates.

I realize, working part-time helps students.
accumulate experience in many different fields.
get future career orientation
have a “beautiful” resume from which to increase job opportunities after graduation.
accumulate professional knowledge to prepare for future careers.

Table 4.3. Positive effect of part-time job on job opportunities of students after graduation

(Source: Interview result)

The aforementioned data clearly illustrate that 88% of students who take part-time work after graduation advance in their careers (according to subjective assessment). Working part-time not only generates revenue, but it also allows students, particularly freshmen, to accumulate and cultivate more life experiences as they attend university. Since working a part-time job allows students to gain knowledge about their field of study. Furthermore, if the work students complete is connected to their subject of study, it is highly convenient, providing students with a very solid base when looking for jobs later on.

In summary, part-time occupations have a wide range of good effects on students’ daily activities, including (1) personal activities, (2) social activities, (3) family activities, and (4) job chances after graduation. Based on the positive benefits discovered, students’ part-time employment is one of the activities that should be encouraged under the condition of working part-time with suitable time constraints. Part-time job has a good effect on students’ learning and living activities, but the positive influence in living activities is stronger than in academic activities.

4.1.4.2. Disadvantages

Negative effects on health and learning

Part-time job is detrimental to students’ health and learning. When students are overly focused on getting money, students will become weary and anxious, which can lead to more serious problems. And, of course, with an unclear health condition, their study will almost certainly fall short of expectations. Too much part-time work, especially for first-year students who are unfamiliar with the pace and approach to knowledge in the university lecture hall, can easily leave them “shocked” with knowledge and make it tough to keep up with another friend.

The effects of working and attending school at the same time on health are shown in Figure 4.7

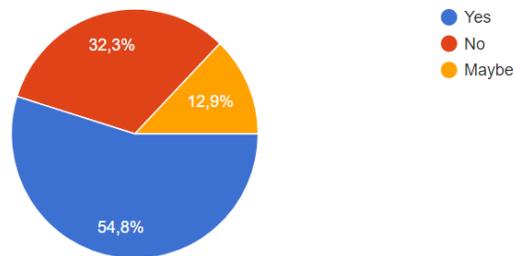

Figure 4.7. The effects of working and attending school at the same time on health

(Source: Questionnaire result)

According to the figure above, students who work part-time and study at the same time have specific negative impacts on their health. The percentage of students that agreed with the preceding circumstance stood for 54.8% of all students. Furthermore, 32.3% of the remaining students disagreed, and 12.9% were unsure regarding the aforesaid issue. Part-time jobs have a relatively unfavorable impact on students’ social activities, manifesting as follows: absence from extracurricular activities; absence from student groups, unions, and associations; absence from voluntary activities. Students in this poll discovered that even when they work part-time, they still have time to socialize with their peers. Because people use school learning facilities while working, the findings of this study contradict those of Wang et al. (2010). In this study, students’ learning activities are less negatively affected than their living activities since the majority of students work part-time with suitable time constraints, and the majority of students pick part-time employment that are connected to their speciality.

Furthermore, the part-time employment has a significant impact on the student’s daily routine. Table 4.4 demonstrates that part-time employment has a moderately detrimental impact on students’ personal lives. Students working part-time, in particular, do not get adequate sleep (7 to 8 hours per day), do not take a lunch break, and do not eat correctly. Students’ sports, recreation, and entertainment activities are less significantly impacted when working part-time than personal activities. This finding supports Anh et al(2013) .’s study on the harmful health impacts of part-time job, particularly when students work long hours.

Negative effects of part-time work on students’ daily activities

I realize that when working part-time, students.
do not have time to sleep enough 7-8 hours per day
do not participate in sports, entertainment or recreational activities.
do not participate in extracurricular activities
do not participate in student organizations, unions, associations
do not participate in volunteer activities
do not have time to hang out with friends

Table 4.4. Negative effects of part-time work on students’ daily activities

(Source: Interview result)

Furthermore, the attitude and morals of students who suffer as a result of working part-time are a source of concern. In this study, a tiny percentage of students (0.7%) believe that earning money will provide a sense of fulfillment, because students prefer to work rather than go to school and squander money, and they have the attitude of avoiding other occupations in order to accomplish more. It demonstrates that the students in this study are in their youth, therefore the majority of them do not pay attention to preserving their health, despite being aware of the negative influence and exercising their health. participation in sports, recreation,

and entertainment activities, however the findings demonstrate that students' attitudes toward the statement "while working part-time, students do not participate in sports, recreation, and entertainment" are almost neutral. Furthermore, according to Vietnamese culture, most students rely on their family from childhood, therefore even when studying away from home, they always make time to visit their homes. Probably for the reasons stated above, the students in this study are not significantly impacted by recreational and family activities, despite working part-time; their health is not adversely affected. Students require more focus.

Influencing future plans

The fact that students are only concerned with obtaining money to satisfy their hobbies will have an impact not just on their health and education but also on their initial plans. According to statistics, the majority of part-time FFLers do not wish to pursue their chosen major. Also, students are more likely to stay with their existing employer following graduation. Several students believe that their part-time work has had a direct impact on their ambitions to study English at the Academy of Finance.

The effect of part-time work on the original intention

Figure 4.8. The effect of part-time work on the original intention

(Source: Questionnaire result)

The graphic above explains how part-time employment affect students' academics, specifically their future plans when working part-time outside of school hours. The majority of the answers were unaffected, accounting for 41.9%; the number of students who agreed was 32.3%; and the remaining students who were unclear accounted for 32.3%. Part-time occupations, in general, have an impact on students' learning processes. Despite the fact that the quantity is not large, students must focus more on their studies.

"Multi-Level" Scam Problem

Scams are growing more complex as the demand for part-time jobs among students in industrialized cities grows. Many bogus work centers have enticed human resources with flying advertisements and dream-earning jobs... and then swindled wages, exploited labor, and failed to pay correctly... As a result, the fact that students work part-time offers numerous concerns. Students, in particular, are hesitant to recommend some reliable information sources to apply for jobs when asked about them. Furthermore, because of their inexperience and lack of a clear reason for working, freshmen are vulnerable to fraud.

4.2. Discussion

According to research findings, students working part-time while still in school is relatively prevalent, and part-time job has an impact on students' living and studying activities. (1) Part-time occupations have a greater favorable impact on everyday life activities than study activities. Students who have money for personal costs and make good use of their leisure time, have extra money, are more rational in their study time

management, and practice what they have learned in school are common symptoms. (2) Part-time jobs have a significantly detrimental impact on learning and living activities, with manifestations such as students not receiving enough sleep (7 to 8 hours per day), not having time for a lunch break, and not eating adequately. (3) At the same time, working overtime for 2 hours or more every day has a bigger detrimental influence. Students' popular solutions for limiting the negative effects of part-time work on learning and living activities include paying attention to diet and getting enough sleep (7 to 8 hours per day), avoiding difficult part-time jobs, choosing part-time jobs related to majors, and planning to study and work part-time every week.

With contemporary students discussing the issue of part-time job and its benefits and drawbacks, the appeal of part-time work is strong, but the risks are not minor. That is not to say that we should waste our opportunities by worrying about what might happen. It is evident that part-time employment benefits students greatly, not just in their social lives but also in learning their good and poor points. Part-time work is excellent, but the hazards are not minor. That is not to say that we should waste our opportunities by worrying about what might happen. It is evident that part-time job benefits students greatly, not only in social situations but also in understanding their strengths and weaknesses. Evidently, mixing employment, education, and leisure enriches students' lives, making them more diverse and valuable in the eyes of employers. However, before electing to work part-time, students should be contacted, as well as spending a significant amount of time researching the job and job brokerage address. Simultaneously, ensure that you will not be sidetracked when studying or working.

Part-time jobs have become increasingly common among students in recent years, with numerous HUFU students engaging in business activities while still enrolled in classes. However, for students, the primary job is to study, and part-time work often has two-way consequences, providing benefits but also posing numerous disadvantages. Working part-time allows students to gain new skills, study, practice, and hone their communication skills, foreign languages, informatics, trust in front of audiences, and other skills that can be applied in practice. This is one of the benefits of part-time employment for students. Apart from that, HUFU students face a variety of challenges, including: With the characteristics of certain part-time jobs, there will be many possible hazards and uncertainty for students, such as being late at work, or taking the risk of having to pay for money in sales and service jobs; or motorbike taxi jobs, where students are vulnerable to unsafely or traffic accidents; Finally, if there isn't a reasonable balance between studying and part-time jobs, academic result will deteriorate.

5. CONCLUSION

Based on the findings and discussion that had been explained, it could answer the research question, what is the influence of part-time job on FFL students' learning ability. Through questionnaire results the researcher concluded that the influence of a part-time job on FFL students' learning motivation was very strong, especially in improving the students' learning ability.

Based on the results, the author gave some recommendations to help students increase their will to attain their study results. Students should focus on research, overcome time challenges, and strive to find solutions. They also should look for employment that are related to their major. At the same time, students must plan a reasonable learning strategy, participate in study group, fully complete the exercises and create a time lock that is really doable for study and a part-time job.

6. APPENDIX

We are students at the Faculty of Foreign Language – AOF. We are carrying out scientific research named “**THE INFLUENCE OF PART-TIME JOBS ON FFL STUDENTS' LEARNING ABILITY**” by conducting a survey on FFL students' occupations. This questionnaire is a part of our research and all

those ideas including personal information will be kept secure and will be used for this research only. We hope you answer the questions honestly, accurately, and accordingly. Thank you for your cooperation!

Part 1. General Information

1.Name:

2.Sex:

4.Class

3.Email:

Part 2. Information questionnaire section

1. How much pocket money are you given in a month?

- a. < 500.000
- b. 500.000 - 1.000.000
- c. 1.000.000 - 1.500.000
- d. > 1.500.000

2. How much pocket money are you given in a month?

- a. < 500.000
- b. 500.000 - 1.000.000
- c. 1.000.000 - 1.500.000
- d. > 1.500.000

3. How much pocket money are you given in a month?

- a. < 500.000
- b. 500.000 - 1.000.000
- c. 1.000.000 - 1.500.000
- d. > 1.500.000

4. Is that amount enough for you to spend for 1 month?

- a.Yes
- b.No

5. Do you have a part time job?

- a.Yes
- b.No

Part 3. In-deep questionnaires section

1. What part-time job did you do?

- a. Tutor
- b. Journalist collaborator
- c. Waiter
- d. Other answer: ...

2. How long do you go to work in a week?

- a. < 7 hours

- b. 7 - 14 hours
- c. 14 - 21 hours
- d. > 21 hours

3. Salary you receive in 1 month?

- a. < 500,000
- b. 500,000 - 1,000,000
- c. 1,000,000 - 1,500,000
- d. > 1,500,000

4. Going to school and working at the same time, how has your study results changed?

- a. Still the same
- b. Increase
- c. Decrease

5. Does going to school and working at the same time affect your health?

- a. Yes
- b. No

6. Does the part-time job affect the study goals you set at the beginning?

- a. Yes
- b. No
- c. Maybe
- d. Others

7. What part-time jobs have helped you (Skills, experience, thinking, personality, ...)

.....

.....

8. The most important reason for you to work part-time?

- a. Have more money to spend
- b. Sense of value for money and know how to spend
- c. Skills training and work experience
- d. Other answers

A STUDY ON SCIENTIFIC RESEARCH OF STUDENTS AT THE ACADEMY OF FINANCE IN HANOI, VIETNAM

**Performed by: Hoang Thanh Hue, Duong Thi Lan Huong,
Nguyen Thi Thuy Trang, Tran Vu Huong Giang
Instructor: Dr. Tran Thi Thu Nhung**

ABSTRACT: Nowadays, scientific research is a practical and vital in the development trend of higher education training all over the country in general and at the Academy of Finance in particular. However, scientific research for students still has limitations, such as a lack of knowledge and skills, a shortage of financial support, etc. Scientific research analyzes the factors affecting students' scientific research activities. The study results show that although the number of students participating in scientific research is increasing, the quality of scientific research papers could be better. Therefore, the authors have studied ways to optimize solutions to improve the quality and effectiveness of training and teaching. In addition, to achieve the research objectives, the authors have surveyed the Academy of Finance students, thereby seeing the limitations and shortcomings and suggesting solutions for encouraging students to engage in scientific research.

INTRODUCTION

Scientific research is a cognitive activity systematically organized by humans, aiming to discover new knowledge about the nature and laws of the objective world proven by practice and plays a role in improving practice.

In response to the requirements of socio-cultural development and training of human resources to serve the industrialization and modernization of the country, the fourth meeting of the 7th Central Committee of the Communist Party of Vietnam was held, assigning the education sector the following mission: “Redefining goals, redesigning programs, plans, contents, educational methods, training and innovating teaching methods at all educational levels”.

With fundamental responsibility, universities have reaffirmed their goal of providing professionals for society with a high level of scientific knowledge and being capable of creative and logical thinking. In order to achieve that goal, universities are constantly looking for ways to improve the quality of training and teaching to enable students to participate in scientific research actively. Scientific research is a specific form of university teaching that helps students actively study, master new knowledge, and practice applying new cognitive methods. However, students still face many difficulties and obstacles in scientific research activities.

Vietnam integrates increasingly intensively with the world economy, participating in and signing many free trade agreements, constantly changing socio-economic conditions, and developing two scientific and technological revolutions. In order to keep up with the development trend, it requires that students improve their ability to do scientific research and apply new methods in their scientific research activities.

Recognizing the importance of scientific research activities in current practice, the Academy of Finance has constantly introduced policies and guidelines to encourage students to participate in scientific research activities. Therefore, the topic “*A study on scientific research of students at the Academy of Finance in Hanoi, Vietnam*” was chosen as the authors’ scientific research topic to participate in the “Vietnam Young Scientific Talent Award.”

1. THEORETICAL BASIS

1.1. Basic issues of scientific research activities of students

1.1.1. Scientific concepts

The term “science” is a highly complex concept at different levels of the active process of perceiving objective reality and abstract thinking.

According to Vu Cao Dam, science is also understood as a social activity aimed at exploring, discovering the laws of things and phenomena, and applying those laws to create principles of solutions to influence things or phenomena in order to change their state.

Thus, science is the research process to discover new knowledge, new theories, etc., about the natural and social aspects. This new knowledge or theory is superior and can gradually replace the old ones no longer relevant. For example, the concept of plants as non-sensual objects can be replaced by plants with sensations.

1.1.2. Concept of scientific research

Nguyen Van Tuan (2011) suggested that scientific research is “a human activity to expand knowledge through scientific methods” This can be understood that scientific research is an activity of searching, examining, investigating, or testing. Through scientific research, we can prove, discover and create new natures of things, methods, and new knowledge of higher value that contribute to the development of society. Doing good scientific research requires professional knowledge about the research field and passion, and the ability to work independently, self-reliantly, and methodically since you are a university student.

1.1.3. Concepts of scientific research subjects

A scientific research subject is one or more scientific problems that are partly or entirely undiscovered but have a premise and knowable ability to answer the problems posed in the science or practice.

The scientific research topic arises due to the requirements of theory or actual practices, conveying two issues: The problem contains a conflict between the known and the unknown; there is a possibility of resolving that conflict.

A scientific research subject arises when the researcher is faced with a contradiction between existing scientific knowledge’s limitations and the requirement to develop that knowledge at a higher level.

1.2. Factors affecting students’ scientific research activities

Scientific research activities of students at universities have been given more and more concern recently. Depending on each school, this activity can be carried out in many different forms, such as writing essays, internship reports, graduation thesis, or conducting scientific research at the faculty or university level. However, scientific research still needs to be improved for university students in our country, even though it is an essential criterion for Vietnam to achieve the goal of having many schools meeting international standards.

According to the research of Duc Son, H., & Thi Nhu Mai, N. (2021), there are 04 factors affecting students’ participation in scientific research: Research environment, motivation, and research capability of students and Incentives provided by universities. Which research environment has the most impact on students’ participation in scientific research

1.2.1 Research environment

Creating a conducive environment to promote students’ research activities is a current trend in most universities in Vietnam. This involves establishing a university education orientation that enhances students’

proactive research capabilities, fostering a research culture among students, building a system of traditional and electronic libraries with rich resources, and providing convenient access. It also involves developing a solid team of scientific researchers (lecturers) who can guide and support students in their research activities.

Although most universities in Vietnam emphasize the principle of “placing the learner at the center” or “enhancing students’ proactive research,” the reality is that there is still a high level of passivity in learning at universities. Students rely heavily on textbooks and lectures from their professors. Assessments of students’ knowledge and understanding of subjects are often based on memorization tests. The use of essay exams or large assignments is not immune to the issue of students engaging in “copy-pasting.” To address this situation, should universities promote student involvement in research, establish mechanisms to convert students’ research results into grades for courses, or recognize them as part of students’ research and academic achievements?

1.2.2. Research motivation

Research activities aim to acquire scientific knowledge, skills, techniques, attitudes, and corresponding personal development. In his doctoral dissertation, Nguyen Duc Nha identified the motivations behind the research, which manifest in the form of knowledge, skills, techniques, attitudes, and personal development that research activities bring. Researchers have identified two overarching motivations that dominate research activities: the motivation to acquire knowledge and the motivation for social relationships.

1.2.3. Research capacity

The current trend in education is closely linked to the development of research competence for faculty members and students. Research activities for students are an essential requirement in universities’ training process. It is also a necessary foundation for innovation in content, teaching, and learning methods and contributes to improving teaching and learning quality.

In her article, Le Thi Van Anh analyzes that in recent years, university students’ participation in research has been limited in the quantity and quality of research topics. Objectively speaking, the number of students interested in research still needs to be bigger, and the quality of research topics is often not high and lacks practical application. Research activities among students are often seen as a movement. Many students participate in research groups with their friends and engage in research for achievements...

1.2.4. Institutional support and encouragement

Regarding encouraging student participation in research, Dr. Nguyen Truc Le, vice-principal in charge of research activities at the National Economics University, stated: “At the beginning of each academic year, we organize research workshops specifically for students. These workshops introduce the benefits of research activities, encourage students to actively participate, and provide guidance on research directions and project implementation. Based on the student’s registration topics, the university, and departments will assign competent instructors to provide active support throughout the research process.

2. CURRENT STATUS OF RESEARCH ACTIVITIES BY STUDENTS AT THE ACADEMY OF FINANCE

2.1. Mission, Vision, and Quality Policies of the Academy of Finance regarding research

Facing the trends of globalization and the Fourth Industrial Revolution, Academy of Finance has adopted the following fundamental directions for development:

Firstly, the focus is on enhancing the quality of education and research. This involves exploring and maximizing the core potential in high-quality education, ensuring the adaptability and responsiveness to the demands of the knowledge-based economy and the Fourth Industrial Revolution.

Secondly, there is a diversification of training programs and innovative approaches to organizational management. Emphasis is placed on enhancing professional practical skills internationally, promoting self-learning through innovative research and experiential learning.

Thirdly, there is a strong emphasis on improving research capabilities and achievements. This involves harmoniously combining fundamental research, applied research, and implementation-oriented research.

Fourthly, proactive international integration is pursued in all activities of the Academy, with a particular focus on regular undergraduate education, staff development, and research.

Fifthly, university administration is innovated with a focus on autonomy and social accountability, creating an academic environment that is open, innovative, and international. Efforts are made to attract outstanding young individuals and scholars to undertake internships and research at the Academy of Finance.

2.2. Current status of research activities by students at the Academy of Finance.

2.2.1. Research environment at the Academy of Finance.

The research activities at the Academy of Finance are closely related to its training and human resource development activities. In order to enhance scientific and technological capabilities, the Academy of Finance has made efforts to establish a systematic and professional research environment to maximize the inherent potential of its students. The research environment for students can be analyzed based on factors such as state policies and regulations regarding research activities, societal development, social capital and financial resources, and infrastructure.

The regulations for student research in universities and colleges are outlined in Decision No. 08/2000/QĐ by the Ministry of Education and Training on March 30, 2000. It states: “Every year, the heads of institutions decide on an appropriate budget to support students’ research activities. This budget is allocated from the following sources: state budget allocated for scientific and technological activities; regular training budget of the institution; funding from organizations, associations, and individuals both domestically and internationally.” However, addressing the financial challenges in a financially autonomous university environment is relatively tricky. To overcome this difficulty, the Financial Academy has actively innovated its financial management for students’ research activities and increased funding for students to fulfill their tasks, primarily through budget sources. Additionally, the Student Union and Youth Union have proactively established fundraising models for research, motivating and encouraging widespread student participation. Notably, the institution has implemented mechanisms to enhance and expand cooperation with research institutions and businesses to secure financial support for students’ research activities, particularly for projects with high practical applicability.

A good research environment requires adequate equipment, laboratories, classrooms, and libraries with sufficient capacity for appropriate scientific materials. Basic equipment such as computers, printers, projectors, and measuring devices also need to be arranged and regularly maintained. The institute has been actively involved in directing and managing the initial tasks related to infrastructure, technical equipment, and utilizing various resources to upgrade and develop towards standardization and modernization. The institute prioritizes infrastructure and equipment investments that are directly linked to the functions and tasks of scientific research, aiming to maximize efficiency and utilization of resources while avoiding waste. A modern and highly equipped library has been constructed, along with an information center, to provide maximum opportunities for teachers and students to update their knowledge and improve the effectiveness of searching for reference materials, conducting experiments, and applying the acquired knowledge. Additionally, the Institute of Finance gradually promotes the transparency of research programs at all levels,

providing opportunities for students to access research topics within these programs, select and participate in research, and improve the selection process for organizing and implementing scientific and technological projects at various levels based on competitiveness and fairness to attract enthusiastic students to engage in scientific research activities.

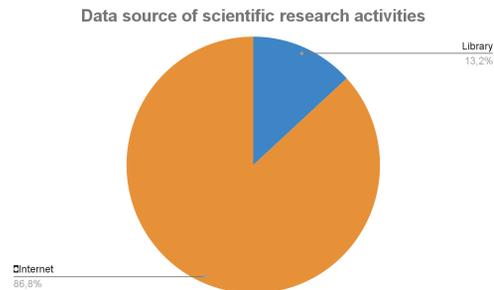

Chart 1: Data source of scientific activities

The results from the chart above indicate that students predominantly rely on the internet as the primary source of data for their research activities, accounting for 87%. On the other hand, research data from the library only accounts for 13%. Therefore, in the near future, the institute needs to improve, establish, and enhance the infrastructure system of the library. This will enable students to access reliable data sources provided by the institution and fully utilize the existing knowledge base.

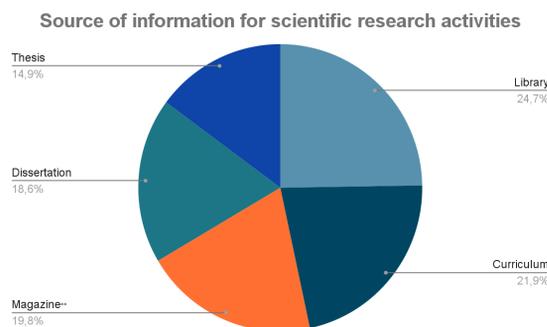

Chart 2: Sources of information for scientific research activities

The analysis from chart 2 reveals that students tend to choose information sources from various library materials, with fairly equal proportions. The highest percentage of students, accounting for 55.1% (223 out of 405 surveyed students), choose reference books from the library. The use of textbooks is reported by 48.8% (198 students). Furthermore, 179 students (44.2%) utilize journals for their research projects. A smaller proportion of students, 41.5% and 33.1%, refer to theses and dissertations, respectively. These findings demonstrate that students at HVTC effectively utilize the available resources provided by the institute.

The research environment should provide students with practical research activities, such as independent research projects, internships, campaigns, and practical programs. Continuous initiatives are organized to highlight the role of innovation and creativity in the era of globalization. To promote research activities, the “Student Research Journal” is particularly appealing. This journal ensures regular publication, with one issue per month, allowing students to access valuable information and learn from their lecturers and peers. Each issue typically contains 19-21 carefully curated articles covering various scientific topics in economics, finance, accounting, auditing, and social issues. This forum serves as a valuable platform for students to gain research experience gradually. The concise length of each article, no more than 5 pages, enables quick and focused reading, facilitating targeted discussions and prompt problem-solving approaches.

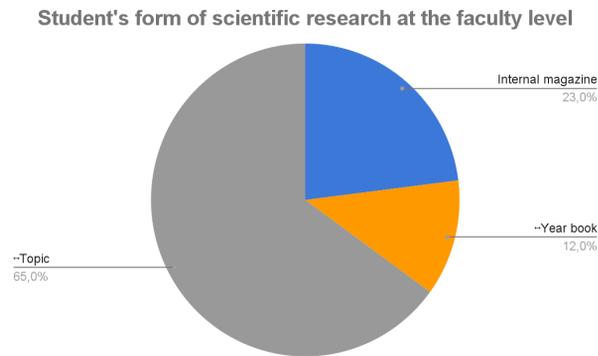

Chart 3: Student's form of scientific research at the faculty level

The descriptive statistical analysis of Chart 3 reveals that students' choices for research projects show that the highest proportion, 65%, opt to write research papers at the department level. Students who choose to write for the Student Research Journal account for 23%. The remaining 12% of students choose to write for conference proceedings.

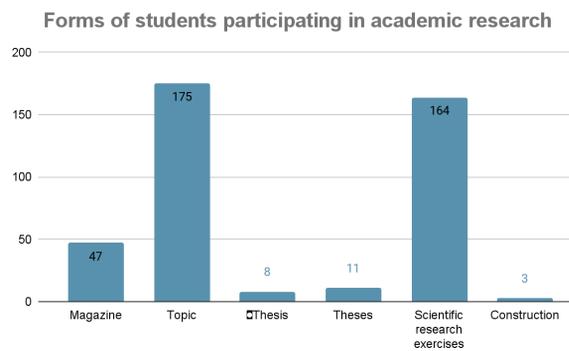

Chart 4: Forms of students participating in academic research

According to the data from Chart 4, among the forms of participation in Academy-level research, the most chosen forms by students are Research Exercises and Research Projects, accounting for 40.2% and 36.5% respectively. Students opting for Report Writing account for 11.6%. The remaining forms, including Thesis, Dissertation, and Research Works, make up a negligible proportion.

From Charts 3 and 4, it is evident that research activities at the Academy of Finance are highly active. The Academy has closely directed various activities to promote diversity in research endeavors, enriching the research environment. This enables students to unleash their creativity and passion for research.

Recognizing the role and significance of research activities in the educational process, the Academy organizes various research-related events such as specialized festivals, Economic Olympics, Marketing Kings, Banking Exploration, Future Chief Accountant, Future Finance Director, English Festival, and Logistics competition at the school level. These competitions, spanning diverse fields, provide valuable knowledge and ignite motivation and enthusiasm among students. In the current digital transformation era, organizing competitions with deep expertise helps students not only practice and apply knowledge to address specific topics but also develop scientific thinking, information exploration skills, presentation and debating skills, and teamwork abilities. The understanding gained from participating in these competitions extends beyond the specific subjects, presenting opportunities for students to apply their knowledge to real-

world projects. These activities also help students hone their teamwork and research skills while expanding their specialized knowledge.

Currently, scientific research activities are widely spreading among students at the Academy of Finance. Scientific research, for students, is a beneficial playground and a nurturing ground for young individuals passionate about research and science. Engaging in scientific research, students acquaint themselves with the process of exploration, understanding, and choosing topics that resonate with their interests. They delve deep into critical thinking and problem-solving approaches. Moreover, the process of conducting and defending their research findings helps students refine their skills in communication, presentation, and confident demeanor before academic committees. This valuable and exciting experiential journey should be embraced by university students during their academic years.

Students at the Academy of Finance possess the vigor of the new era. They are not deterred by challenges or hardships, instead, they are proactive in seeking new knowledge, unafraid to express their ideas. These characteristics are highly essential for research activities. Creativity and practical connections open up new avenues of research and new research problems. The dynamic nature of research enables researchers to actively explore, learn, think, and take action. The confidence, coupled with the valuable knowledge from instructors, helps students stand firm in their academic positions. These qualities are inherent in every student at the Academy of Finance.

2.2.2 Motivations driving students' research activities

Scientific research promotes social development, improves human life, and addresses challenging issues. In an era of rapid scientific and technological advancement, the motivations driving students' research activities have become incredibly important and diverse.

Students are encouraged to acquire specialized knowledge in their fields of study and engage in research activities to develop skills and explore new aspects of their areas of interest. This helps them enhance problem-solving abilities, foster creative thinking, and develop teamwork skills, increasing their competitiveness and creating career opportunities.

Scientific research is closely tied to enhancing the quality of learning and unleashing students' potential and creativity, enabling them to generate valuable research products and works. With this understanding, the Financial Academy has implemented policy mechanisms and incentives to create motivation and encourage students to participate in research activities.

2.2.3 Research capabilities of students at the Academy of Finance.

Higher education is shifting its training goals towards research-oriented and applied universities, focusing on technology transfer. This orientation and transformation require institutions, including the Financial Academy, to pay more attention to students' research capabilities.

Research helps students accumulate knowledge, expand their understanding, gain experience, develop their skills, and foster a proper research attitude. The research results can be effectively applied to their learning process and real-life situations. Therefore, it is necessary to consider both the process and the research outcomes to fully evaluate students' research capabilities at the Academy of Finance.

The attitude of students at the Academy of Finance when engaging in research activities is an essential factor influencing the success of research projects. Scientific research is often a lengthy and complex process, so students must have patience and perseverance to overcome challenges and difficulties. Additionally, students should possess critical thinking and creativity to develop ideas and solutions for

research issues. They need to approach experiments and data collection with caution and accuracy to ensure the reliability of research results. Due to the increased awareness and recognition of the importance and benefits of scientific research, the attention and focus of Academy of Finance students have been elevated, yielding remarkable results.

To produce high-quality works, the necessary skills for student involvement in research must be mentioned. Students at Academy of Finance need to be able to search for and analyze relevant literature on their research topics. This skill includes reading and comprehending specialized materials, assessing the reliability of sources, and collecting necessary information. Students should also be able to analyze and evaluate data collected from experiments or various sources. This skill involves using data analysis software and tools and assessing and explaining the results of data analysis.

Moreover, students need to be able to argue and write reports on research findings. This skill includes identifying research objectives, analyzing data, and presenting research results clearly and logically. Communication skills to effectively present ideas and research findings, both in writing and in oral presentations, are essential skills that students should practice regularly. These skills include writing emails, presenting to a panel of examiners, and introducing research at scientific conferences.

To successfully carry out a research project, students need to have the ability to use research methods correctly. Currently, there are various research methods in the field of scientific research. However, based on data collected from a survey conducted with over 400 students at the Academy of Finance, the chart below illustrates the percentage of the most commonly applied research methods:

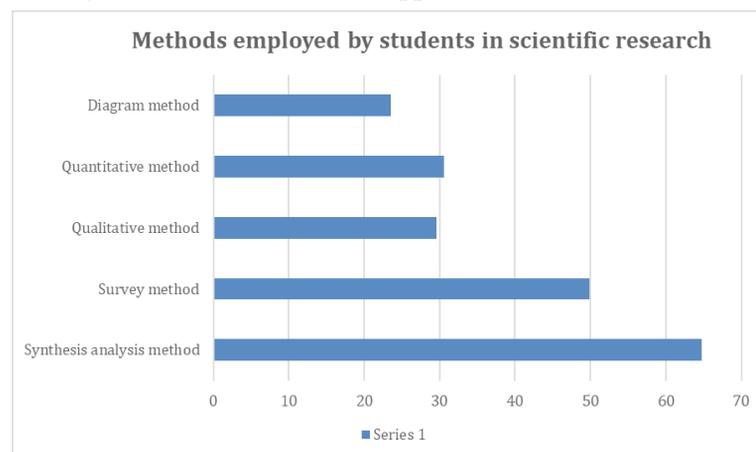

Chart 5: Methods employed by students in scientific research

The chart reveals that the most commonly used research method in scientific research activities is the synthesis analysis method, accounting for 64.7%. The survey also indicates that the survey method is used by 49.9% of students, while qualitative and quantitative methods are employed by 29.6% and 30.6% respectively. Finally, the least utilized method is the diagram method, representing only 23.5% of the total.

Although research activities have received attention, students often pay more attention to the final product and research outcomes. As a result, some students may have concerns and fear that they will not achieve the desired results, which may discourage their participation in research. The participation rate of Academy of Finance students in research activities over the past three years shows that only about 20% of students actively engage in research initiatives, with a focus on third and fourth-year students. Among them, the proportion of final-year students participating in research is highest, ranging from 50% to 60%, while third-year students account for 12.8%. The majority of participants are fourth-year students, as they

have completed a significant portion of the curriculum. However, it is crucial to develop research initiatives for first and second-year students as well, to nurture the passion and interest in scientific research.

Based on the survey data collected from over 400 students at the Academy of Finance, the number of research projects being conducted is still relatively low, and the publication rate of research papers is not high. The survey results reveal that a significant percentage of research projects are categorized as “not achieved,” accounting for 76.5%. Additionally, 12.3% of projects are classified as “average,” only 8.9% reach the “good” level, and a merely 2.2% are rated as “excellent.” These findings suggest that the quality of research projects by students still requires attention and improvement. Consequently, the institution needs to implement appropriate measures and policies to encourage student participation in research activities, aiming not only to increase the quantity of research projects but also to prioritize their quality, thereby contributing to valuable research outcomes.

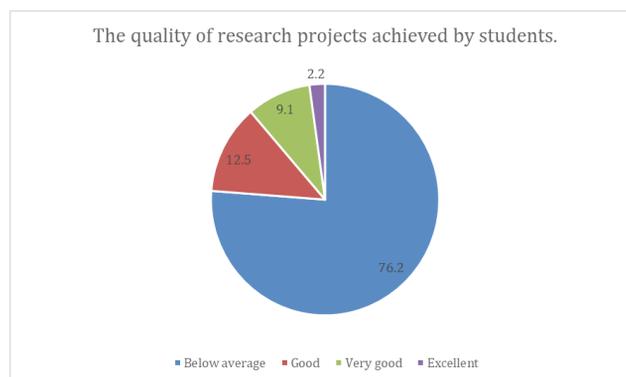

Chart 6: The quality of research projects achieved by students

2.2.4. Encouragement and support for student research at the Academy of Finance.

- *From the Academy’s Perspective:*

The Academy creates research movements for students by organizing competitions and intellectual playgrounds to attract and foster students’ learning experiences and knowledge sharing. The Academy regularly organizes department-level and Academy-level competitions to promote active participation in research activities to provide beneficial platforms for students passionate about scientific research. Additionally, the Academy frequently organizes seminars and contests to facilitate knowledge exchange between institutions, such as the “Olympic Economics and Application: Enhancing the Quality of Scientific Research” competition (2020). Furthermore, intending to continuously enhance the quality of education and scientific research, the Financial Academy values maintaining and expanding international collaborations. In addition to existing traditional partnerships, the Academy has explored and expanded cooperation with numerous universities, institutions, training centers, and reputable research institutes worldwide, including the University of Greenwich, the Association of Chartered Certified Accountants (ACCA), the Institute of Chartered Accountants in England and Wales (ICAEW), the World Institute of Business and International Studies (WIBI) in Singapore, the University of Toulon, the St. Petersburg National Research University of Economics and Finance, and the Central University of Finance and Economics in China. The Academy emphasizes the innovation of program content and teaching methods, considering scientific research as a vital approach to enhancing the quality of education. To effectively implement this solution, the Academy has refined the training objectives for each of the 54 specialized majors, serving as the foundation for developing research program systems aligned with specific disciplines. The improved training objectives are based on surveys of practical needs and evaluations of training quality, aiming to “provide high-quality

financial and accounting training and scientific research products to society.” Adequate funding is allocated to research activities to encourage and motivate students’ active participation in research. According to Decision No. 496/QĐ-HVTC issued on October 3, 2013, by the Ministry of Finance, the funding sources for student research include the state budget allocated for scientific and technological activities, supplementary funds from the Academy’s revenue, and other legal funding sources.

- *From the perspective of student Union and Departments:*

The Student Union and departments play a crucial role as a “bridge” between students and the Academy, effectively disseminating information about scientific research to students. This activity aims to deepen students’ awareness of the importance of scientific research and demonstrate that research is not a distant endeavor but highly relevant for all students. The Student Union and departments ensure close official communication channels between various departments within the institution to provide timely support for students during the research process. They organize competitions and platforms to attract student participation, facilitate knowledge sharing, and foster learning experiences. For instance, on March 7, 2023, the Foreign Language Department’s Student Union successfully organized the “Student Scientific Research Symposium 2023” with the participation of experienced faculty members and 57 student mentors who achieved outstanding results in their research projects. This symposium introduced valuable methods for students to engage in scientific research and helped establish appropriate attitudes and goals for academic and research pursuits. Interacting with experienced students who have achieved high accolades in scientific research boosted the confidence of other students, making it easier for them to select research topics, carry out and refine their projects, and publish increasingly high-quality research works. This contributes to developing the research movement within the Foreign Language Department.

- *From the perspective of faculty members:*

Faculty members guide student research: They regularly stimulate students’ creativity, critical thinking, and ability to analyze and critique various issues scientifically. Faculty members also provide motivation and inspiration, nurturing students’ passion for research. Faculty members’ research publications serve as clear evidence for students to emulate. Additionally, faculty members at the Academy actively listen, understand, and identify the strengths, difficulties, and challenges that students encounter during the research process. Moreover, faculty members assist students in selecting research topics, planning, searching for literature, conducting surveys, and processing and analyzing data, among other tasks.

In summary, within the context of globalization and deepening international integration, considering the significant role of scientific knowledge, promoting research activities at universities is of utmost importance. Student research activities at the Academy have tremendous significance, transforming the learning process into a self-directed learning journey. This foundation is essential for the Academy to enhance the content and teaching methods and contribute to improving the quality of education, meeting the demand for fostering and developing knowledgeable financial and accounting professionals to support the industrialization and modernization of the country. Effectively managing and motivating student participation in research is a pressing task for the Academy. The strength and effectiveness of managing student research activities can only be achieved through coherently integrating these approaches. Neglecting or implementing isolated measures diminishes the effectiveness of managing student research activities in today’s universities.

3.1. Solutions to enhance the effectiveness of student research activities at the Academy of Finance

3.1.1. Directions for research activities at the Academy from 2022-2023 to 2025

Assoc. Prof. Pham Van Lien: To improve the quality of research activities in the coming years, the Academy will focus on several directions. Specifically, it will emphasize the significance of research as one of the essential criteria used to evaluate the ranking of universities and the assessment of faculty members in

universities and academies. Alongside this, the Academy will strengthen and enhance the quality of activities conducted by specialized research groups in various departments and research clubs for young researchers within the institution. It will also promote the organization and implementation of research projects with high practical applications, especially projects funded by the state and ministry and those serving practical management at the local level. The Academy will ensure the proper selection and timely assignment of research topics to individual units, aligning with the research directions established by the institution.

Furthermore, the Academy will enhance the socialization of research activities by exploring and expanding financial resources outside the budget to support research projects. It will also strive to establish stronger connections between research outcomes and the practical application of financial resources.

3. SOLUTIONS TO IMPROVE THE EFFICIENCY OF SCIENTIFIC RESEARCH ACTIVITIES OF STUDENTS AT THE ACADEMY OF FINANCE IN THE COMING TIME

Solution 1: Organize and develop a plan to systematically and effectively implement scientific research policy for students.

Objective: To organize and implement scientific research activities for students systematically and methodically, to promote their dynamism, creativity, and independent research capacity, to form self-learning ability for students, and to create opportunities for students to access and apply scientific research methods effectively and standardly. To develop a specific and clear plan to make the policy implementation more effective.

Requirements: The plan must be implemented specifically for the participants. Universities must base their capacity and ability to pursue their roadmap. The plan must clearly state the tasks of each unit and department in implementing the policy, avoiding overlap affecting the policy's effectiveness. Human, financial, and material resources must be ensured from the state budget or socialization.

Description: The plan must be concretized according to each stage in a specific, clear, and appropriate way. The plan must have a schedule according to the academic year, training roadmap, or according to the requirements of the organization. Based on that, balance the resources involved according to the appropriate schedule. The content of the plan must be accurate and fully implemented. To ensure policy implementation, each piece of content must clearly state the time, resources, requirements, etc...

Tools: To implement this solution, universities must deploy the following tools: Issuing documents such as plans and decisions for implementing scientific research policy. Universities must ensure that the number of researchers, lecturers, and experts is sufficient to implement the plan. Finance is an essential factor determining the success of the policy. Therefore, to effectively implement this policy, universities in Vietnam need to ensure this financial source.

Solution 2:

It is strengthening the dissemination and communication of research policies for students.

They are encouraging research support centers.

They are providing support for entrepreneurship and innovation among students at universities.

Objectives: Firstly, to help students recognize the importance of research in enhancing their academic proficiency within the educational institution. Simultaneously, it allows researchers, faculty members, and experts to realize that effectively implementing research policies for students contributes to improving the effectiveness of research work and enhancing the position of students within the institution's academic environment. Secondly, the dissemination efforts will give students a more specific understanding of

the policies, enhancing their awareness of the correct implementation and encouraging their roles and responsibilities in the policy execution process.

Requirements: First, closely monitor the guidelines and directives from the Ministry of Education and Training, documents from the School Council, and the Management Board of educational institutions to obtain the most effective and up-to-date information for dissemination. Secondly, the dissemination activities should be closely linked to the content of the policies so that the stakeholders involved in policy implementation can clearly understand the value that the policies bring, thereby enhancing the effectiveness of policies.

Description: Higher education institutions assign the task of disseminating and promoting research policies for students to the Student Affairs Department for coordination and implementation. Subordinate organizations must ensure that the content of the policies is effectively communicated to each enrolled student in timely identification of difficulties in students' research activities to propose plans for higher-level management agencies to address. Additionally, the policies should be disseminated and communicated on the university's website and integrated into weekly and quarterly activities related to civic education and legal advocacy for students.

Tools: The following tools should be utilized: Higher education institutions in Vietnam should issue clear and specific guidelines; appoint a team of experienced and dedicated researchers, faculty members, and experts to ensure practical communication efforts.

Solution 3: Improving the allocation and coordination of research policy implementation for students in current higher education institutions.

Objectives: The policy's success heavily relies on allocating and coordinating resources within the current higher education institutions. Therefore, enhancing the allocation and coordination mechanisms for effective policy implementation is crucial. This solution aims to establish a suitable agency where the responsibilities and authority of the stakeholders involved in policy implementation are clearly defined, avoiding the shifting of responsibilities during the process.

Requirements: Firstly, the allocation and coordination should ensure accurate functions and tasks assigned to the stakeholders involved in policy implementation. The allocation should be based on their expertise, experience, and relevant skills. They were accumulating policy implementation experience during work. Secondly, the coordination should be determined based on the organization's shared responsibilities, obligations, and collective benefits to promote policy effectiveness. Each individual and organization involved in the policy implementation process should take action to identify their tasks and responsibilities in policy implementation.

Description: Higher education institutions need to concentrate on structuring their organizational framework and human resources to achieve effective policy implementation. The allocation agency should focus on the quality and efficiency of policy implementation, avoiding the utilization of inadequately skilled personnel. Effective coordination should be based on the functions and tasks of lower-level units and the capacity of human resources, establishing a cohesive coordination mechanism. Specifically, the Research and International Cooperation Department of the University should develop plans and activities for research according to the requirements, ensuring freshness to create enthusiasm among students. Departments, divisions, and units within the university should collaborate with relevant units to evaluate research content, monitor and assess students' research results, and propose commendation methods per the university's regulations. The Finance and Accounting Departments of universities should balance and ensure financial resources for policy implementation, develop contingency plans during the implementation process and submit them to the university's leadership to secure financial resources for policy implementation. The

leaders of university units should organize discussions and provide specific and transparent measures to implement policies most effectively. Additionally, the Science Department and related units should coordinate to implement policy content properly, avoiding shifting, evading, or blaming responsibilities.

Tools: To implement this solution, supportive tools such as guidelines, instructions, and assignments should be provided to departments, divisions, and units within the university, as well as to researchers, faculty members, and experts.

Solution 4: Monitoring, evaluating, and promoting the implementation of research policies for students requires regular and unexpected assessments to utilize resources in current universities efficiently.

Objective: Monitoring and promoting policy implementation are crucial steps in determining the policy's success. The assessment helps identify policy issues and serves as a basis for the execution process. The objective of monitoring policy implementation is to evaluate the performance of departments, divisions, and units within the university regarding their assigned functions, tasks, and delegated authorities. It aims to identify gaps and weaknesses in management mechanisms and policies to propose necessary improvements. Additionally, it aims to prevent, detect, and address any legal violations. For individuals involved in policy implementation, monitoring, evaluating, and promoting policy performance help promptly identify any violations and overcome difficulties and barriers that may hinder the implementation process. This allows the university's leadership to react timely and practical for efficient policy implementation.

Requirements: Monitoring, evaluating, and promoting implementation must be carried out regularly and promptly to ensure timely resolution plans, thus ensuring the effectiveness of policy implementation.

Descriptions: Strengthening the monitoring and supervision of departments, divisions, units, and individuals involved in policy implementation is essential. This is a vital and significant aspect determining the quality and effectiveness of the policy. Leaders of departments, divisions, and units within the university must quickly establish and improve work regulations and assign tasks during policy implementation. The university's Council and Management Board should pay attention to and guide the implementation of research policies for students. The Science and Technology Department and the International Cooperation Department should oversee and guide departments, divisions, units within the university, and stakeholders involved in policy implementation.

Tools: To implement this solution, supporting tools such as guiding documents, instructions, and assessment programs should be provided. Additionally, the human resources involved must ensure the implementation process. In conclusion, research policies for students in higher education institutions are crucial in defining the quality of education in universities today. In Vietnam, higher education institutions increasingly focus on research policies for students as a critical factor in establishing their position. Each year, these institutions allocate budgets to implement research policies for students. This article aims to comprehensively evaluate the research activities of students in Vietnamese higher education institutions and propose solutions to enhance effectiveness. The success of this policy relies on its proper implementation, making the implementation process vital and coherent in research activities.

CONCLUSION

Scientific research plays a crucial role in general education and universities. For current universities in our country, scientific research is considered one of the critical factors in improving the quality of education and producing skilled graduates to meet the increasing demands of society.

Scientific research among students is an immensely significant activity that enhances the quality of higher education. In recent years, the emphasis on improving the quality of student research activities

has been particularly prominent at the Financial Academy. However, there are still many limitations and challenges in this area, such as students needing to fully recognize the importance of research or facing difficulties in conducting research. This study analyzes the current status of student research activities at the Financial Academy to enhance the effectiveness and quality of teaching and learning at the institution.

“The study on the current status of student participation in scientific research at the Financial Academy” has identified the positive aspects and limitations of the institution’s current state of student research activities.

The overall evaluation of the quality of research activities at the Academy reveals that the university’s leadership and departments have implemented various measures to promote student research. Both teachers and students have recognized the significant role of research activities. Based on this awareness, students have shown enthusiasm and passion for research. However, there are still several limitations, such as students needing more opportunities to engage in research, only participating in low-level research activities, and needing more resources for high-level research and inadequate research facilities. Additionally, students have limited time dedicated to research activities. Therefore, universities need to innovate and establish a comprehensive and systematic research management system to meet the quality standards of research activities.

In conclusion, universities should strive to renew the management of research activities coherently and systematically to ensure compliance with quality evaluation standards for research activities.

EXAMINING DETERMINANTS OF CAREER COMMITMENT OF BANKERS

Author: Pham Thi Nhu Y¹,

Mentor: Đang Hung Vu¹

ABSTRACT: *This study examines the factors affecting career commitment of banking employees. The suggested research model includes seven factors influencing career commitment, i.e. bank support, job fit, need for achievement, family involvement, job satisfaction, and organizational commitment. Data was collected from an online survey with 300 banking employees on Google form. SPSS 20 was used for data analysis. Results show that career commitment of banking employees is influenced by need for achievement, job satisfaction and organizational commitment. Several managerial implications to enhance the career commitment of bankers are suggested.*

Keywords: *banking, career commitment, job satisfaction, need for achievement, organizational commitment*

1. INTRODUCTION

Human resources play an increasingly important role in businesses. Whether or not a company has a separate human resource management department, all managers are involved in human resource decisions in their field. Workforce is needed for success of business in the digital era [1]. Employees play an important role in the success or failure of an organization, so it is necessary to have a strong human resource management department to promote the effectiveness of human resource management activities [2].

It is said on public media that banking career is always one of the best careers. Bankers work in different departments, i.e. consumer and corporate banking, international banking, credit and so on. Bankers may have a good working environment with higher pay and more favorable promotion opportunities than other careers. However, bankers also said to face a competitive and challenging work environment. It is because bankers are required various skills and expertise. Bankers are challenged with difficulties of reaching KPIs, being adapted with changing, innovative and expanding working process, new technology, and enthusiastic young employees.

Considering the pros and cons of banking career, it is good to know that what are the determinants of career commitment of banking employees. Understanding of the determinants, and the career commitment of bankers would benefits banking managers in terms of developing baking workforces, and enhancing working effectiveness. Given that banking is an attractive industry, studying the career commitment of bankers in Vietnam is necessary and significant.

The purpose of the study is three fold. First, it investigates the factors affecting career commitment of banking employees. Second, it analyzes these factors and the career commitment of banking employees. Finally, it is followed with managerial implications for banking organizations. This paper will be followed with theoretical background, research methods, results and implications.

2. THEORETICAL BACKGROUND

2.1. Career commitment and related concepts

Trang [3] clarifies how career is different from other terms. Career is a job or a series of jobs one does during his/her working life, especially when he/she continue to do better work and earn more. A work is an

¹ An Giang University, VNU-HCM.

activity that a person uses his/her physical or mental effort to perform, usually for money. A job is what one does and receives money on a regular basis, usually referring to an occupation, a specific job or a certain position, e.g. chefs, teachers. One does a job to earn money, e.g. working for a company. Profession is a type of work that requires special training or skills, especially one that requires a high level of education. A professional career is a job in a high position that requires education and training, especially in law and medicine. Occupation usually refers to the profession associated with each person's life, used in official forms and documents, talking about the type of work such as teacher, lawyer, driver.

Commitment is a state in which an individual is bound by his or her actions and through these actions in the belief of maintaining his or her own activities and participation. Commitment is what makes us like what we do and keep doing it, even when the rewards are not obvious [4]. Commitment has been defined as an individual's degree of commitment or commitment to a set of behaviors and motivates a person to act [5]. Commitment is a key concept in the psychology of an organization. It refers to the amount of resources and effort that an individual is willing to invest in his or her job role.

First defined in 1971, professional commitment is the strength of one's motivation to work to maintain a chosen career role [6]. Career commitment is defined as an employee's psychological connection to their career [7]. Professional commitment is defined as a person's attitude towards his or her profession [8]. Professional commitment can be conceptualized as the degree to which someone identifies and values his or her profession [8]. Professional commitment is the strength of a person being motivated to work in a chosen career role [8]. Professional commitment can be considered as one's attitude towards one's profession or profession wherein career commitment involves developing personal career goals, identifying and engaging in such goals that a person is willing to work to support their cause is consistent with its values [9].

The concept of career commitment is underpinned by the notion that a career is a predictable sequence of related jobs that are hierarchically arranged within a particular occupation, thus providing opportunities for advancement. careers for career aspirants [10]. Career commitment includes: occupational commitment and professional commitment, the terms can be used interchangeably [9]. Professional commitment is the belief and acceptance of the goals and values of a profession, a willingness to work for its sake, and a desire to maintain membership in the profession [11]. Occupational commitment is conceptualized as an affective commitment to a profession [12].

One's occupational commitment is conceptualized as a psychological link between a person and his or her profession based on an emotional response to that occupation. A person with a strong professional relationship will identify more strongly and experience more positive feelings about a career than someone with a weak career commitment [7].

Professional commitment can be measured by an individual's reluctance to leave his or her professional role, an individual's willingness to maintain his or her career if encouraged to change, or a desire to want to continue their career after evaluating possible alternatives. Professional commitment can also be described as an individual's commitment to a broader class of work activities than a particular job or organization [13].

Career commitment is characterized by an unwillingness to change careers, personal involvement in a job role, dedication to the profession, pride in the profession, and stimulation from professional activities [14].

Women see career as personal growth, self-fulfillment, satisfaction, contributing to others and doing what one wants to do. Men see a career as a sequence or progression of jobs that leads to recognition and reward. Men relate the work they do to their career advancement, while women disregard their current job and view a career as a personal goal [14].

There is a significant difference between a career and a job in terms of time commitment and investment. The job is short-term and can last for only a few months to half a year, while pursuing a career can take decades of hard work [15]. Career commitment can be individualized, long-term and future-oriented, so it is not expected to tie current job performance as strongly as organizational and job commitments [16].

According to Blau [8], career commitment is an intention to build a meaningful career and pursue and operate for a long time, he considers career commitment as an individual's attitude towards a career or professional profession.

Professional commitment has three components, namely: emotional commitment, ongoing commitment, and normative commitment. An emotional commitment is a personal emotional attachment to one's career. Ongoing commitment is an assessment of the cost of losing a sunk investment in a career, and normative commitment is an obligation to maintain a career [7].

In spite of various concepts relating to career commitment, career commitment is the strength of a person being motivated to work in a chosen career role [8].

2.2. Research model and hypotheses

London [17] documented that job challenge as a determinant of career motivation, a significant positive relationship between jobs and three dimensions of career motivation. In addition to facilitating one's psychological development to keep up with work, challenging jobs can stimulate career resilience through the opportunity for autonomy in completing capital tasks. have in one's professional role. When the level of challenge is high, bankers tend to switch and commit less to the profession [17]. Therefore, the following hypothesis is proposed:

H1: Job challenge has a negative effect on career commitment.

Bank support or opportunities for growth conceptually similar to organizational career management have been shown to be significantly and positively related to career performance [18]. London (1983) hypothesized job challenge as a determinant of career motivation. Facilitating one's psychological development to keep up with work, challenging jobs can stimulate career resilience through the opportunity for autonomy in completing inherent tasks. in one's professional role. Organizational opportunity for growth is hypothesized to indirectly affect career commitment through job satisfaction and organizational commitment. Organizational opportunities for growth can enhance one's career development or the adjustment of competencies related to one's professional role [6]. Since career growth can constitute one's career goals, the realization of this goal will lead to career satisfaction. Commitment to a career requires focused energy. To the extent that one's mental and physical energies are diverted to other matters, it is difficult to develop and maintain a commitment to the cause" [19]. The longer this persists in a person's career, the less committed they will be to their career. Role ambiguity occurs when a person is uncertain about what tasks they should perform. personal development, the support of the organization's superiors is a motivation to help individuals commit to their careers. When the organization supports employees, employees feel comfortable and satisfied than with the job, the level of professional commitment increases higher. Therefore, the hypothesis is proposed:

H2: Bank support has a positive effect on career commitment.

The literature on job fit revolves around the idea that every organization and individual has distinct personality traits. The more similar the characteristics between the individual and the company, the higher the employee's work productivity and job satisfaction. The right personality for the job will also reduce stress, job dissatisfaction, frequent absenteeism and even turnover [20]. Edwards (1991) introduced two

basic concepts of compatibility between people and work. The first is needs-and-ability matching, in which the knowledge, skills, and abilities of workers are commensurate with the actions, desires, or preferences that are fulfilled by jobs that they perform. The second form, which occurs when workers' needs are commensurate with what the job requires, is the type of compatibility often associated with supply-demand or demand-value matching, emphasized in different adjustment theories [21]. Job fit is seen as the relationship between the person's personal characteristics and the job characteristics. This compatibility occurs when a person has the opportunity to handle multiple tasks at the same time in a way that they like.

Employees whose jobs are compatible with their career aspirations are more satisfied with the work environment and demonstrate greater career commitment. There are few studies on the relationship between job fit and career commitment. However, based on logical arguments, when employees have jobs that are compatible with their career aspirations, they will be more committed to their careers [22]

H3: Job fit has a positive effect on career commitment.

An analysis of contemporary research on the premise of career commitment found seven factors more relevant to organizations. These seven factors provide the impetus for organizational leaders to promote labor- and industry-oriented career commitment. Through establishing a work environment that supports strong teamwork, job satisfaction, feedback and support, workers are more likely to develop a strong connection with their current workplace, at their home and with their profession. In addition, workers who have internal control, and who have accumulated many years in their profession, are also more likely to develop a strong career commitment. Finally, compensation and role status will also affect career commitment.

Compensation has a direct effect on both career and organizational commitment. Role status has a negative impact on career commitment, as people who are career committed require a large degree of stability and continuity in their current job. Thus enhancing career commitment, committed workers means careful management of these factors in relation to role statuses. Since career-engaged workers are often much more flexible than organizational-attached workers, due to a greater focus on internal motivating factors for achieving satisfaction than on organizational factors, motivated by the organization. It is therefore important for management practitioners to understand the value and pervasiveness of professional commitment, and to know how to stimulate and retain professionally committed workers [9]

For many individuals, sooner or later, achievement also needs external confirmation (recognition) if it is to be maintained in the long term. Thus, success generates a cascade of externally validated rewards, all of which have the effect of increasing the individual's self-esteem, where failure leads to a decreased sense of self-esteem. The need for achievement has also been identified by London [17] as being interrelated and determining career commitment. The need for achievement has been used to describe the "personal striving of individuals to achieve goals in their social environment" [23]. London [17] also identified goal achievement as indispensable for the individual to "need achievement".

High salary and attractive benefits have a positive effect on commitment, when high-achieving individuals, such as bankers, high-achievers achieve good KPIs, individuals enjoy salary and benefits, higher. Benefits are especially important to career-oriented people out of respect, as these people are said to value themselves. For individuals, promotion is not only related to recognition of achievement, it can also be related to increasing financial rewards and status, salary cannot be considered purely as a factor. It is also closely related to status and recognition; The more a person is financially rewarded, the greater the recognition for services within an organization. Money can play a very important role in people's lives, both material and spiritual joy, money as an incentive for each person because it affects the respect others have for individuals.

It is therefore not surprising that financial reward can sometimes be measured as a factor in job satisfaction. Praise has the effect of boosting an individual's self-esteem and also gives feedback on how the employee is making progress. Of course, performance feedback is necessary if the individual is given the opportunity to modify his or her behavior based on past performance. There is little doubt that employers who want to improve their employee satisfaction must pay attention to both the feedback aspect of accreditation and the issues of recognition through formal procedures, such as promotion. Therefore, it is likely that an employee who is very focused on needs and goals will have a long-term direction and plan and be committed to his or her career. Therefore, the following hypothesis is proposed:

H4: The need for achievement has a positive effect on career commitment.

Family involvement is thought to influence career commitment both directly and indirectly through job satisfaction and organizational commitment. Steffy and Jones [24] also reported a significantly positive relationship between career commitment and dual career planning support, a term that is conceptually similar to spouse support. As a form of emotional support, spousal support can help ease the effects of career disappointments and thus enhance career resilience and therefore commitment.

Considering the assumed indirect effect of Family involvement on career commitment through job satisfaction and organizational commitment, Rosin and Korabik [25] reported that spouse support has a positive effect on husband's job satisfaction. Aryee and Tan [10] documented that spouse support was a significant positive predictor of organizational commitment in a sample of women in frequently mobile jobs [10]. Therefore, the following hypothesis is proposed:

H5: Family involvement has a positive relationship with career commitment

According to [17], job satisfaction, was incorporated into the subdomain "job engagement", as a major determinant of career commitment. Job satisfaction can be defined as the degree to which employees love their jobs [26] or employees' positive feelings towards their jobs [27].

Stemming from the Roethlisberger & Dickson study, commonly known as the Western Electrical study, job satisfaction was initially thought to increase productivity. Much of the current concern with job satisfaction concerns its impact on engagement, absenteeism, and turnover [26] A satisfied employee is expected to enjoy his or her job and the organization and is most likely to be favorably inclined and committed to his or her career. However, once again it should be noted that career commitment, job engagement and job satisfaction are different concepts [8] There is a small empirical study on the job satisfaction-career commitment relationship.

Reasons for being satisfied or dissatisfied with their tasks, satisfied people gave the main reason as 'feeling of progress' themselves while those who were not satisfied with the task gave reasons such as 'bored' depressed', not interested in the current job to be able to commit to a career. They tend to switch careers [28]. Thus, the excellent completion of the task causes a feeling of satisfaction. Therefore, the following hypothesis is proposed:

H6: Job satisfaction has a positive effect on career commitment.

Porter conceptualized organizational commitment as a strength of personal identity that is associated with a particular organization. In addition, organizational commitment has been interpreted in different ways and suggests that organizational commitment can be summarized as an individual's attachment to his or her organization. Organizational commitment can be most broadly characterized by at least three factors: first, a strong belief, acceptance of the organization's goals and values; second is the willingness to use considerable effort on behalf of the organization; the third is a clear desire to maintain membership of

the organization [29]. Mowday, Steers [30] asserted that organizational commitment represents something beyond loyalty to the organization; Organizational commitment refers to a proactive relationship with the organization, individuals are willing to give something of themselves to contribute to the commitment to the organization such as the doctrine related to such relationships, psychological connection by which an individual can connect with other individuals or with an organization.

Organizational commitment can be expected to have a positive relationship with professional commitment. Organizational commitment has been referred to as a behavioral pattern, a set of behavioral intentions, a motivator, or an attitude. Organizational commitment from this perspective is seen as an attitude related to the nature of the relationship between employees and the organization [30]. Such an attitude well enhances career commitment and success; Therefore, it is expected that professional commitment and organizational commitment will be positively correlated. [17] noted that organizational commitment should be an important individual variable explaining career commitment. Obviously, professional commitment is different from organizational commitment. Professional commitment and organizational commitment are two different aspects of human opinion and opinion, which are strongly related to increasing organizational productivity and efficiency.

For example, a person might be committed to his or her career and not to the organization, and vice versa. That is, a person committed to his or her career can move on to other organizations if it helps to advance his career. On the other hand, another person who is committed to the organization can change careers within the organization and remain loyal. Therefore, the following hypothesis is proposed:

H7: Organizational commitment has a positive relationship with career commitment.

The research model has combined outstanding elements of 3 models by London [17], Carson and Carson [31] and Goulet and Singh [28].

3. METHOD

3.1. Sampling

The respondents are employees of joint stock commercial bank in Vietnam, including senior managers. The questionnaire was distributed to respondents via google form sent via Zalo and/or Facebook in April 2023. There are 313 answered questionnaires, of which 300 were valid and 13 were rejected. Convenient sampling was applied, therefore most of respondents are in the South of Vietnam.

3.2. Instruments

The questionnaire was adopted from Goulet and Singh [28] and Aryee and Tan [10]. Some modifications and/or wordings have been made to the questionnaire thanks to face-to-face interviews with banking staff, e.g. working process and working time at the bank. Measurement variables are listed in Appendix 1.

3.3 Data analysis

Data was analyzed with SPSS 20 software. Exploratory factor analysis (EFA) was conducted to extract factors and to examine its internal reliability. Cronbach's Alpha analysis was applied to assess reliability of measurement items. According to Nguyễn [32], Cronbach's Alpha value not smaller than 0.60 is acceptable in terms of reliability.

Pearson correlation was run to test the close linear correlation between the dependent variable and the independent variables. It is to early identify the problem of multicollinearity when the independent variables are also strongly correlated with each other. When there was no multicollinearity found, regression analysis was done. Finally, managerial implications for banking employees were proposed.

4. RESULTS AND DISCUSSION

4.1. Results

EFA for the independent variables were done twice. First, 6 measurement variables were removed. Second, two other observed variables were removed because they do not converge. As a result, two factors were removed, i.e. job challenge and job fit. This research failed to test H1 and H3.

Five factors were finally used for regression, shown in Table 1. The research model was adjusted with five determinants of banking career commitment, i.e. bank support (H2), need for achievement (H4), family involvement(H5), job satisfaction (H6) and organizational commitment (H7).

Table 1: EFA analysis of independent variables

Regression results was shown in Figure 1. Three hypotheses were supported. First, banking employees who commit to their organization also commit to banking career (H7). The need for achievement is recognized by bankers as important to career commitment (H4). The bankers who are satisfied with their work, i.e. pay, benefits, working policy, working time have positive commitment to banking career (H6). The two hypotheses H2 (bank support) and H5 (family involvement) were not supported.

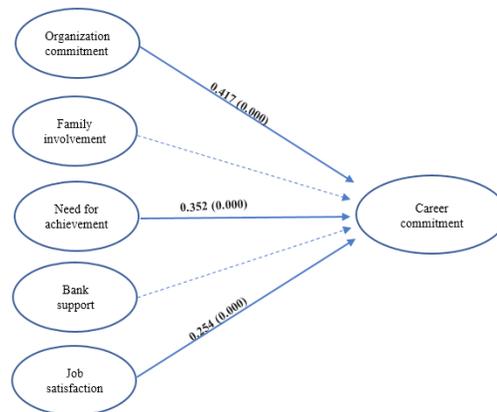

Figure 1: Determinants of banking career commitment

4.2. Discussion

The positive effect of organizational commitment, need for achievement, and job satisfaction on banking career commitment is confirmed in this study. This result is in line with previous study by Aranya, Pollock [11], which documented that job satisfaction positively affects organizational commitment. Bankers with greater need for achievement are also more committed to their banking careers, which was confirmed by Goulet and Singh [28]. In line with Arogundade Ayodeji [29], Mowday, Steers [30], Carson and Carson [31], and London [17], this study also reported the positive relationship between organizational commitment and career commitment.

This quantitative results did not support the effect of bank support and family involvement on career commitment, although the literature on career commitment supports these effects. The liner positive effects of the two factors were not confirmed. However, it is necessary to conduct further investigation on the effect of job fit and family involvement. Qualitative research would have been done to explore how job fit and family involvement.

5. CONCLUSION AND MANAGERIAL IMPLICATION

Although this research was unable to test the effect of job challenge and job fit, it confirmed the positive effect of organizational commitment, need for achievement, and job satisfaction on banking career commitment. In addition, the liner positive effects of bank support and family involvement were not supported in this quantitative research. This calls for future research about the effect of bank support and family involvement. Also, future research would invest more on the use of measurement of job challenge and job fit.

The research results carry several managerial implications. For greater job satisfaction of bankers, it is good for banks to define goals and expectations from employees. By setting clear goals and expectations at work, banks ensure that employees understand their duties and mission. Staff training and development are necessary to provide training and development programs to enhance professional skills and understanding of the banking profession. This helps employees feel that they are invested and have the opportunity to grow at work. In addition, banks should bring exciting promotion opportunities for employees. It is necessary to provide employees with equal opportunities to develop their careers. This helps employees have clear goals and commitment to the long-term development of the banking profession. Employees' achievements must be recognized. Recognition of the achievements and efforts of employees would increase employees' dedication to their profession.

APPENDIX 1: MEASUREMENT ITEMS

Organizational Commitment		
OC1	I am willing to put in a great deal of effort beyond that normally expected in order to help this organization be successful.	[10]
OC2	I am proud to tell others that I am part of my organization."	
OC3	I talk up this organization to my friends as a great organization to work for	
OC4	I want to continue working at this bank for a long time	
OC5	I am proud to work at this bank	
OC6	I am really interested in the future development of the bank	
Job Satisfaction		
JS8	Leadership from superiors	[28]
JS9	Working time at the bank	Developed
JS10	My colleagues	[28]
JS11	Advancement in ministry	[10]
JS12	Working process at the bank	Developed
Family Involvement		
FI13	It's an indispensable part of life	[22]
FI14	An ideal center to live and strive to work	
FI15	Always interested in me	
FI16	Is the orientation for the goal I strive for	
FI17	More important than anything in life	
FI18	Always given me a lot of time	
Need for Achievement		
NA19	Accept difficult jobs to promote your ability	[28]
NA20	Willing to take on any additional responsibility beyond my own	
NA21	Try hard to do better than your colleagues	
NA22	Take risks when working to achieve expected results	
Bank Support		
BS23	Reward employees who work hard to keep up with the development of the bank	[10]
BS24	Care about employees' lives	[22]
BS25	Create opportunities for employees to improve their professional skills	[22]
Career Commitment		
CC1	The decision to choose a career in banking was the right decision for me	[11]
CC2	Being part of the banking profession really inspires me to do my best work	

CC3	I have a plan for my growth in the banking profession	[31]
CC4	Banking career means a lot to me personally	
CC5	Banking is an important part of who I am	
CC6	I have a strategy to achieve my goals in banking	
CC7	I have specific goals for my growth in the banking profession	
CC8	Banking is the best job I've ever had	[11]
CC9	I'm glad I chose banking out of the other careers I considered at the time I joined	
CC10	I am proud that I am part of the banking profession	
CC11	Sticking to a banking career indefinitely is not a reckless thing to do	
CC12	I work harder than usual to be successful in banking	
CC13	If I don't need to work and still make a living, I still choose to be a banker	
CC14	I am very loyal to the banking profession	
CC15	The value of the banking profession is the same as mine	
CC16	I accept most of the jobs assigned to continue working in banking related fields	
CC17	If there is a job other than banking that pays the same, I will choose another profession	
CC18	I can adapt to another profession, as long as the type of organization is similar to a bank	

FACTORS AFFECTING INDIVIDUAL CUSTOMERS' DECISION TO PURCHASE LIFE INSURANCE IN HANOI

Author: Vuong Minh Ngoc¹, Pham Bao Ngoc¹

Mentor: PhD. Ho Thi Hoai Thu¹

ABSTRACT: *Based on the theoretical framework of theory of planned behavior, this study examines the process from the intention to acquire life insurance among persons in Hanoi City, Vietnam. The research is being carried out in Hanoi via an online survey of 400 respondents. The study employed Cronbach's alpha, exploratory factor analysis, KMO and Bartlett's test, and regression analysis with SPSS software based on the data acquired. Customers in Hanoi city decision to purchase Life Insurance based mainly on 5 factors: Motivates for purchasing life insurance, Life events, Barriers in purchasing Life insurance, Company brand, Opinions of relatives.*

Keyword: *life insurance, purchase intention, Hanoi city,...*

1. INTRODUCTION

Life insurance provides several economic and social benefits. Aside from that, life insurance firms employ many people and assist them better their quality of life. Customers who participate in life insurance will be financially covered with the amount pledged from the first ban when there is a risk such as illness, accident, or death, using modest amounts of money they save to pay yearly premiums. This money will assist their family in alleviating their monetary challenges as well as the emotional anguish they are experiencing. Furthermore, the corporation will contribute to the future of their children's education, assisting them in realizing their aspirations, even if they are unable to continue to support their family if they engage in education insurance for their children. Alternatively, the money clients get after they die will allow them to live a happy retirement life free of children.

Vietnamese people currently tend to preserve money owing to tight familial ties; also, the society's welfare system cannot cover the demands of the majority of the population, causing additional challenges. the need to save for their children's future, driving the growth of life insurance. consumers, however, examine numerous variables when determining whether or not to purchase life insurance products, such as insurance business, insurance goods, customer service... These elements are entwined in the process of consumers researching and deciding to purchase insurance.

People are powerless against unanticipated threats and risks, while living in an advanced-civilized civilization with great technology. Life insurance operations were created to address community-sized hazards and promptly recoup losses. The expansion of the country's life insurance business in the market has contributed to the country's overall economic development. The insurance industry has recruited many employees, generated numerous employment, assisted in increasing household income, and enhanced the contemporary lives of all sectors of society.

The rise of life insurance has contributed to the country's economic progress in general. The insurance business has attracted various activities, generating jobs for many people, assisting in increasing family incomes and improving the present lives of all sectors of society. Annual insurance money has also

¹ Academy of Finance

contributed to the GDP of the country. Life insurance climbed by 20% on average in the first quarter of 2017 compared to the same time previous year, when life insurance premium revenue increased by 29% and non-life insurance premiums increased by 15%. Total market premium revenue was estimated to be at 77,000 billion VND at the end of November 2016, representing a 23.4% rise over the same period last year. Particularly for life insurance, revenue as of the end of the month 11/2016 reached 44,000 billion VND, an increase of more than 30%.

Life insurance in Vietnam has been developed for more than 20 years, but it is still in the process of exploiting new markets. With a population of over 90 million people, only 8% of the population engages in life insurance, while the rest do not. The majority of life insurance clients are from large cities in neighboring provinces, and exploitation is still restricted. When compared to demand and market potential, this figure remains quite low. This outcome demonstrates that the Vietnamese life insurance industry still has a lot of promise and has not yet produced the expected results.

For life insurance firms to gain a better understanding of Vietnamese clients, satisfy their needs, contribute to company development, and enhance sales by analyzing variables influencing customers' propensity to acquire life insurance products. This is why I picked the topic "**FACTORS AFFECTING INDIVIDUAL CUSTOMERS' DECISION TO PURCHASE LIFE INSURANCE IN HANOI**".

2. THEORETICAL FRAMEWORK AND LITERATURE REVIEW

2.1. Theoretical framework

2.1.1. Consumer behavior and purchasing decisions.

- **Consumer behavior**

Consumers are defined as individuals who buy for and consume goods and services to meet their own needs. They were the last to use the manufacturing process's goods.

Consumer behavior is understood as a series of decisions about what, when, how, where, how much, and how often that each individual and group of consumers must make decisions over time about choosing to use products, services, ideas or activities. (Wayne D. Hoyer, 2008)

Consumer behavior is the interaction between factors that influence perception, behavior, and the environment by which people change their lives. (Schiffman, et al., 2005)

According to Kotler (2004), in marketing, marketers study consumer behavior with the aim of identifying their needs, preferences, habits, namely what consumers want to buy, why they buy that product or service, why they buy that brand, how they buy, Where to buy, when to buy and how to buy to build a marketing strategy to motivate consumers to buy their products and services.

According to Bennett P. D (1988), consumer behavior is the behavior they exhibit in finding, purchasing, using, and evaluating products and services that they expect will satisfy their individual needs. Referring to the decision to buy a certain product, or buying behavior, there is a theoretical model mentioned as the Theory of Planned Behavior (TPB). Purchase intention reflects future behavioral predictions or plans, or beliefs, and will translate into purchasing decisions. Although Mittal (2001) argues that purchase intention can not accurately predict, however, according to Conner (1998) intention represents a person's motivation to make an effort to perform the behavior.

Thus, customer behavior is the progression and consideration of customers from the moment they recognize a need for particular goods or services until they opt to purchase and utilize these goods or services. Customer behavior refers to the thoughts and sentiments of customers during the buying and consuming process, which includes behaviors such as purchasing, utilizing, and handling items and services.

- **Purchasing decisions**

The psychological process of customers from identifying requirements to generating options and finally selecting particular items and brands is referred to as purchasing decisions. Some costs are little, such as purchasing body wash, while others are significant, such as purchasing a villa. The greater the importance of the purchase, the more time and effort that goes into it.

2.1.2. Definition of Life insurance

Life insurance is a product of insurance firms that protects people from health, body, and life hazards. Simply put, the participant accepts and enters an insurance contract with the insurance business to pay the necessary fees on a regular basis into the insurance company's financial reserve fund in order to be paid a particular amount when regrettably at risk or at maturity.

According to Clause 1 - Article 12 - Law on Insurance Business, an insurance contract is an agreement between an insurance buyer and an insurance enterprise in which the insurance buyer must pay a premium and the insurance enterprise must pay the insurance money to the beneficiary or compensate the insured upon the occurrence of the insured event.

The essence of life insurance is a secure technique of providing future financial security with the goal of replacing income sources when the member faces unforeseen hazards (life insurance benefits). As a result, life insurance is extremely important in people's lives since it not only helps to stabilize life when unforeseen risks arise, but it also serves as a mechanism to share risks in the community by taking the majority to offset the few.

2.2. Literature review

- **Model of factors affecting the decision to buy life insurance by Vo Thi Thanh Loan (2005)**

According to this study, only three supporting aspects of family, psychology of spending and saving (risk and benefits), and gender had a beneficial impact on the choice to purchase 1-year term life insurance. Gender has the greatest influence, followed by supporting influences from family and spending and saving psychology. The author does a regression analysis using the choice to buy each type of life insurance and adds the gender element to the study to elucidate the influencing variables on the buying decision for each type of insurance. As a result, insurers can make better selections when counseling consumers.

Furthermore, the issue has the problem because the author provides 12 components with 60 observed variables, which is excessive for interviewers. The quality of the survey sample suffers as a result of the excessive amount of questions, since the client is unable to focus on accurately answering all of them. As a result, the research findings will not be as predicted.

- **Research on factors affecting the trend of buying life insurance in Tra Vinh province by Nguyen Thi Bup (2012)**

The topic "Factors Affecting the Decision to Buy Life Insurance in Tra Vinh Province" is based on Nguyen Thi Anh Xuan's topic and develops additional elements impacting the choice to buy life insurance such as: Details about the insurance firm. According to research findings, seven variables impact the choice to purchase life insurance: investment advantages, savings benefits, convenience of access, financial benefits, influence of family, health protection benefits, and benefits trump dangers. The author gives various ideas, including: promoting trade promotion activities, improving the professional qualifications of the company's employees, improving service quality, improving and developing products, opening a wide network, and improving agents' professional ethics.

However, one weakness of this study is that the author did not thoroughly investigate which of these criteria has the most influence on the choice to purchase life insurance and whether it has a positive or negative impact on the decision to purchase life insurance. Furthermore, when surveying the questionnaire for research, the author surveyed both those who had purchased life insurance and those who had not purchased life insurance, but the author has not thoroughly studied the factors influencing the decision to purchase life insurance for customers with this potential to have effective approaches to this audience.

In conclusion, the above studies demonstrate that the authors developed varied and unique scales, but the authors have proved that the groupings of elements on corporate brand, purchasing motive, consultant, and perceived value impact the choice to buy life insurance.

2.3. Hypothesis and research model

The author proposes suitable factors into the research model “Factors of life insurance” based on the theory of life insurance, the consumer behavior model of Phillip Ko-tler (Kotler P., Philip Kotler’s contributions to marketing theory and practice, 2011) and the inheritance from the model (Thanh, 2005) variables influencing individual customers’ decisions to purchase life insurance in Hanoi.

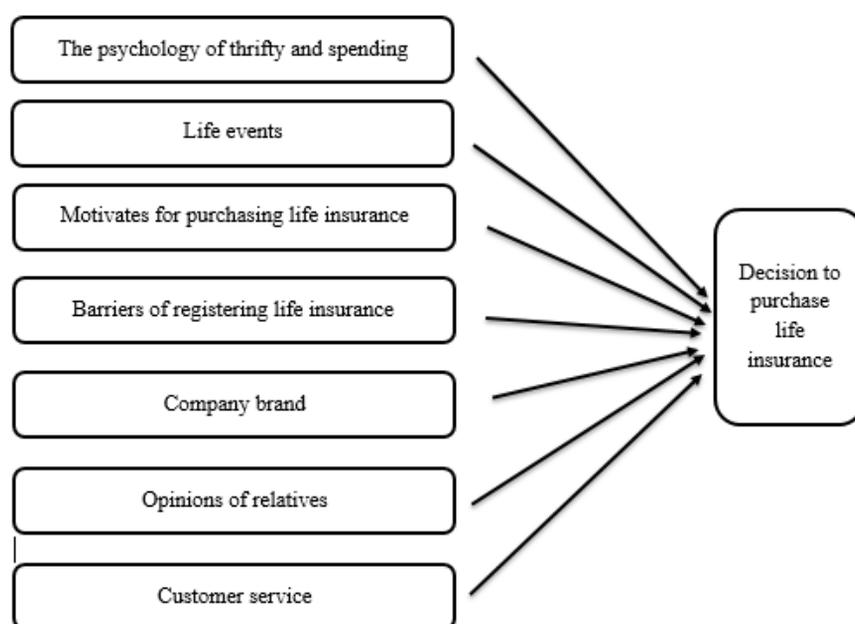

Figure : Proposed research model

Research hypothesis

Hypothesis	Content
H1	The psychology of thrifty and spending has positive impact on the decision to participate in life insurance
H2	Life events has positive impact with the decision to join life insurance
H3	Motivates for purchasing life insurance has positive impact on the decision to participate in life insurance
H4	Barriers in purchasing life insurance has positive impact on the decision to participate in life insurance
H5	Company brand has positive with the decision to join life insurance
H6	Opinions of relatives have positive impact on the decision to participate in life insurance
H7	Customer service has positive impact on the decision to participate in life insurance

After doing study on the variables influencing the intention to purchase insurance products by (Jagdish N. Sheth, 2001), (Nguyen X. A., 2004), (Nguyen B. T., 2012), and (Thanh, 2005). The studies were discovered to be based on the models of Jagdish N. Sheth, Banwari Mittal, and Bruce I. Newman. This covers a set of personal qualities as well as a set of elements that impact the intent to purchase a product. As a result, I picked the research model based on the work of Jagdish N. Sheth, Banwari Mittal, and Bruce I. Newman since it is a research model on the elements that impact the desire to purchase insurance products that has been chosen and developed by many authors from across the world.

3. RESEARCH METHOD

3.1. Scale and questionnaire

Here are the scales and questions related to factors that affect the decision to purchase life insurance:

Variables	Encrypted	Observation variables
The psychology of thrifty spending (TS)	TS1	I save first and spend later
	TS2	I am very interested in future savings
	TS3	I consider the price before buying something
Life events (LE)	LE1	I buy insurance when I witness the risks of people around
	LE2	I bought insurance when I got married
	LE3	I buy insurance when my health is not good
Motivates for purchasing life insurance. (MP)	MP1	I want to financially protect my family
	MP2	I want to save for retirement
	MP3	I see the benefits of life insurance from others
Barriers of registering life insurance (BR)	BR1	The insurance products are complicated and make me confused
	BR2	I am not satisfied with the insurance services
	BR3	I don't believe insurance referrals
	BR4	I have unstable income
Company brand (CB)	CB1	I buy insurance at a company that has a reputation and reputation in the market
	CB2	I buy insurance at a company that has a variety of packages to suit my needs
	CB3	I buy insurance at a company that has good customer service
Opinions of relatives (OR)	OR1	My parents were supportive of me buying insurance
	OR2	My friends supported me to buy insurance
	OR3	My brother/ sister supported me to buy insurance
	OR4	My spouse agrees to me to buy insurance
Customer service (CS)	CS1	Prompt assistance for clients as required
	CS2	Staff members are well-versed in advising and answering clients' inquiries.
	CS3	The procedure is resolved quickly
Decisions to purchase Life Insurance (DB)	DP1	I bought life insurance through a consultant
	DP2	I think buying life insurance is worth my money
	DP3	I think buying life insurance is the right decision

The scale is constructed based on the theoretical foundation of the scale as well as the customer's decision to acquire life insurance products. In this article, we use the Likert scale, which has been adjusted and supplemented so that respondents are asked to rate their level of agreement or disagreement with the research content in Hanoi City based on a research questionnaire on the need for customers in Hanoi to purchase life insurance.

- **Questionnaire:**

The questionnaire consists of 2 main parts:

Part one consists of 4 questions aimed at gathering general information, in-cluding:

- + Personal information: Age, Gender, Income
- + Information about the occupation: Retail, Business owner, Homemaker, Skilled labor.
- + Time information about life insurance
- + Information about the purpose of life insurance

Part two includes questions that affect customer satisfaction on what influences buying decisions. In particular, the 5-point Likert bar is used to measure customer satisfaction with the factors that influence the decision to purchase life insurance after it has been used, specifically:

- 1 = Very low
- 2 = Low
- 3 = Average
- 4 = High
- 5 = Very high

3.2. Sample and data collection

Because the number of clients to be polled is rather high (400), the author will conduct the survey straight outside the Hanoi circle. Customers come to the life insurance firm for activities such as signing contracts, paying fees, borrowing money, earning interest, receiving compensation... and samples are randomly picked from potential customers to learn, advise...

The author gathers data by giving out response sheets directly to consumers who have purchased life insurance and those around them, whereas the author collects data online by sending surveys to individuals via social media platforms.

The information for this study was gathered via self-response questionnaires. Kumar (2005) claims that using questionnaires to obtain research data offers the following advantages: Save money, time, and human resources while maintaining complete anonymity.

Furthermore, it is clear that the study questionnaire instrument allows us to obtain the essential information from a large number of respondents swiftly and efficiently.

Questionnaire: deliver the questionnaire directly to the respondents, with the answers stored in the database, and request a time to collect it once done. To preserve the respondents' anonymity, the questionnaire included a promise to exclusively utilize information for the topic's research purposes, as well as a pledge to keep the respondents' information secret. Furthermore, in order to maintain neutrality, the respondent's last name is not displayed in the questionnaire.

The deadline for sending out surveys and receiving responses is January 1, 2023, and it expires on May 30, 2023. After the questionnaires were collected, the data was checked, and inappropriate replies were disqualified before being forwarded for processing and analysis.

Data collected is saved to a file, and statistical software SPSS 20.0 is used to handle and evaluate the data. Data analysis features in SPSS software include descriptive statistics, scale reliability testing, exploratory factor analysis, regression analysis, ANOVA in-depth analysis, and the Pearson test.

4. RESULTS

4.1. Description of the samples

After receiving 437 questionnaires, the authors discarded 37 questionnaires with inappropriate answers. Final results obtained 400 questionnaires with satisfactory answer information used for analysis.

All validity questionnaires will be processed using SPSS 20.0 software to conduct confidence assessment, factor analysis, correlation analysis, regression analysis and hypothesis testing.

Table: Sample characteristics

		Frequency (people)	Percent (%)
Age	20-35	213	53.25
	35-45	98	24.5
	45-55	89	22.25
Income	<5million	34	8.5
	5-15 million	123	30.75
	15-25 million	122	30.5
	>25 million	121	30.25
Gender	Male	174	43.5
	Female	190	47.5
	Other	36	9
Education	Graduated from high school	234	58.5
	University Graduate	102	25.5
	Masters - PhD	67	16.75
Occupation	retail	89	22.25
	business owner	102	25.5
	homemaker	97	24.25
	skilled labor	112	28
Sum		400	400

According to the above aggregate data, clients participating in life insurance are quite wealthy, with a very diverse distribution throughout several businesses and spheres of activity, and at various ages. Following the Covid-19 epidemic, insurance services in general, namely life insurance, have grown in popularity among clients because people are concerned about health issues and the unavoidable hazards of life. And, as of now, life insurance has progressively become a trend, as shown in Hanoi City, where the majority of persons aged 22 utilize life insurance services because of the benefits it provides.

According to the above aggregate data, clients participating in life insurance are quite wealthy, with a very diverse distribution throughout several businesses and spheres of activity, and at various ages. Following the Covid-19 epidemic, insurance services in general, namely life insurance, have grown in popularity among clients because people are concerned about health issues and the unavoidable hazards of life. And, as of now, life insurance has progressively become a trend, as shown in Hanoi City, where the majority of persons aged 22 utilize life insurance services because of the benefits it provides.

4.2. Reliability and validity of the scales

4.2.1. Reliability Test with Cronbach's Alpha

	Observed variables	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Cronbach's Alpha
The psychology of thrifty spending				
1	TS1	0,626	0,645	0,762
2	TS2	0,529	0,754

SPSS 20.0 was used in this study to examine the reliability and validity of model elements influencing Vietnamese youth's propensity to use chatbots in online purchasing. A variable is deemed dependable if its Cronbach's alpha is greater than 0.60. We had all of the model's variables scaled so that Cronbach's Alpha was between 0.6 and $0.8 > 0.6$, which satisfied the criteria. There were no variables with a corrected item-total correlation less than 0.3. As a result, these variables may be completely utilized in the next study.

4.2.2. Exploratory Factor Analysis (EFA) result

- **With independent variables.**

Before doing a factor analysis, it is required to determine whether this approach is acceptable for application. KMO (Kaiser-Meyer-Olkin of Sampling Adequacy) and Bartlett's Test are used to carry out the test.

For hypothesis testing, use Bartlett's Test. H_0 are variables in the population that are not associated with each other, the general correlation matrix is a unit matrix, and the KMO coefficient is used to determine if the sample size is consistent with factor analysis. According to Hoang Trong (2007), a Sig. value of less than 0.05 enables refutation of the hypothesis H_0 , while a value of 0.5KMO1 indicates proper factor analysis.

KMO and Bartlett's Test	
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.	.678

Bartlett's Test of Sphericity	Approx. Chi-Square	2402.397
	df	253
	Sig.	.000

The coefficient KMO = 0.678 > 0.5 and the Bartlett's coefficient of significance (Sig) of 0.000 indicated that these 23 variables are associated, and that the component analysis method used in the study is adequate.

Rotated Component Matrix^a

	Component						
	1	2	3	4	5	6	7
LE3	.916						
TS3	.916						
TS2	.693	.529					
LE2	.693	.529

CS3						.884	
CS1						.819	
CS2						.728	
MP2							.778
MP3							.718
MP1							.645

The rotation factor matrix findings shown in the table reveal that the observed variables all have factor load factors larger than 0.5 and upload only one factor. As a result, independent variable scales assure convergence and differentiation.

There are no changes in the model's components after doing exploratory factor analysis. As a result, the study model is not altered and stays unchanged with the presented hypothesis.

- **With dependent variable.**

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.741
Bartlett's Test of Sphericity	Approx. Chi-Square	627.888
	df	3
	Sig.	.000

Total Variance Explained						
Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	2.413	80.423	80.423	2.413	80.423	80.423
2	.324	10.813	91.235			
3	.263	8.765	100.000			

The EFA analysis is suitable, as indicated by the KMO coefficient = 0.742 > 0.5 and the Bartlett test with Sig.=0.000 0.05.

Eigenvalue of 2.411 > 1. Total variance value = 80.358% > 50%, this number implies that this set of factors explains 80.358% of the variation in the customer choice scale’s observed variables.

4.2.3. Correlation analysis

The authors employed Pearson correlation analysis to examine the connection between the dependent and independent variables. It indicates that the two variables are positively linked, which means that the greater the value of one variable, the greater the value of the second variable.

Correlations

	F_TS	F_LE	F_MP	F_BR	F_CB	F_OR	F_CS	Y

Y Pearson Correlation	.052	.605**	.528**	.185**	.467**	.207**	.044	1
Y Sig. (2-tailed)	.304	.000	.000	.000	.000	.000	.377	
Y N	400	400	400	400	400	400	400	400

The Sig. (2-tailed) of independent variables F_TS (The psychology of thrifty spending) and F_CS (Customer service) with dependent variable Y (Decisions to purchase Life Insurance) both have value more than 0,05. The Pearson correlation test results are shown that F_TS and F_CS must be excluded for further regression analysis.

The 5 meaning factors (F_LE, F_MP, F_BR, F_CB, F_OR) are preserved and can be continued to further regression analysis.

4.3. Regression Analysis

Model Summary					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.789 ^a	.623	.618	.394	1.832

a. Predictors: (Constant), F_OR, F_LE, F_BR, F_MP, F_CB
b. Dependent Variable: Y

A Durbin-Watson value of 1.832 is within the acceptable range of $1 < D < 3$. This allows the model to conclude there is no correlation between the residuals.

Model		Coefficients						
		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-.605	.202		-2.989	.003		
	F_LE	.414	.028	.479	14.695	.000	.900	1.111
	F_MP	.281	.031	.300	9.027	.000	.867	1.153
	F_BR	.104	.033	.098	3.130	.002	.983	1.018
	F_CB	.232	.027	.291	8.520	.000	.823	1.214
	F_OR	.091	.031	.098	2.951	.003	.865	1.156

a. Dependent Variable: Y

According to the regression analysis, statistical results show that the normalized regression coefficients of the regression equation are all different from 0 and sig. < 0.05 proves that there are 5 independent variables involved in influencing the “purchasing decision” of the customer with the insurance item, which are (F_LE), (F_MP), (F_BR), (F_CB), (F_OR).

The regression equation according to β the normalization system is rewritten as follows:

$$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 X_{4i} + \beta_5 X_{5i} + \beta_6 X_{6i} + e_i$$

$$Y = -6,05 + 0,479F_LE + 0,3F_MP + 0,098F_BR + 0,291F_CB + 0,098F_OR$$

Rewrite:

Decisions to purchase Life Insurance = -0,65 + 0,479 Life events + 0,3 Motivates for purchasing life insurance + 0,098 Barriers of registering life insurance + 0,291F_ Company brand + 0,098 Opinions of relatives

4.4. Hypothesis testing results

Hypothesis	Content	Actual result
H1	The psychology of thrifty and spending has positive impact on the decision to participate in life insurance	Reject
H2	Life events has positive impact with the decision to join life insurance	Accept
H3	Motivates for purchasing life insurance has positive impact on the decision to participate in life insurance	Accept
H4	Barriers of registering life insurance has positive impact on the decision to participate in life insurance	Accept
H5	Company brand has positive with the decision to join life insurance	Accept
H6	Opinions of relatives have positive impact on the decision to participate in life insurance	Accept
H7	Customer service has positive impact on the decision to participate in life insurance	Reject

5. DISCUSSION AND RECOMMENDATION

5.1. Discussion

Based on theory included to build a research model, along with the steps, the author makes the conclusions:

According to the Hypothesis tested result, there are 5 factors affecting the decision to purchase life insurance in Hanoi city is: Life events, Motivates for purchasing Life insurance, Barriers of registering Life insurance, Company brand, Opinions of relatives.

This model explains 61,8% of the change in the Decision to Purchase Life Insurance variable of

consumers in Hanoi city to 5 independent factors in the model, while external variables explain the remaining 38,2% of the variance in the dependent variable. All of the variables have a positive beta coefficient, indicating that they have the same effect as the choice to purchase life insurance, which means that the higher (raised) the insurer satisfies these conditions, the higher the decision to purchase life insurance. A comparison of the Beta column's normalization coefficient value reveals:

The strongest impact was the “Life events” factor, ($\beta=0.479$ and $\text{sig.}=0.000$). With a normalization factor of $\beta=0.479$, “Life events” increased by 1 unit, “Decision to purchase Life insurance” increased by 0.479 units. This outcome is warranted, as people are frequently touched by near life occurrences. Many people in modern society are aware of and choose insurance products. When people have a steady income, they frequently consider spending on things that benefit them and their family. In affluent circumstances, each family member can enroll in an insurance plan that meets their requirements. Furthermore, while getting married, customers seek a secure existence, as well as a strong educational future for their children and financial stability. Customers frequently seek insurance to secure financial security for their family and themselves when their own health is not in excellent shape. The breadwinner will relieve your financial load if you have prepared a financial protection plan with the appropriate insurance package. Feel confident enough to work, care for, and provide value to the family from there.

The second level of impact was the “Motivates for purchasing life insurance” factor ($\beta=0.3$ and $\text{sig.}=0.000$). With a normalization factor of $\beta=0.3$, “Motivates for purchasing life insurance” increases by 1 unit, “Decision to purchase Life insurance” will increase by 0.3 units. Hanoians, in particular, and Northerners in general, are cautious with their spending; they recognize the importance of saving and frequently spend to financially guarantee their family and themselves in retirement. Furthermore, because life insurance is a service sector, it is difficult for clients to see the benefits of insurance, other than collecting money at maturity or assuming risks and being compensated by the insurance firm. As a result, witnessing others receive reimbursement from the insurance business will encourage people to purchase life insurance.

The third level of impact is “Company brand”. The regression analysis results show that this factor also has a positive impact on customers' decision to purchase life insurance ($\beta=0,291$ and $\text{sig.}=0,000$). If the normalization factor $\beta=0,291$ means that “Company brand” increases by 1 unit, the measurement value “Decision to purchase Life insurance” increases by 0,291 units. This is comprehensible since the more individuals elect to join in insurance because the insurance firm has a significant respectable brand in the market. The brand is represented not just in financial strength, but also in numerous areas such as products, services, community activity, and brand marketing. Because life insurance products are long-term contracts, the brand is critical in allowing clients to “choose to deposit gold” and transmit complete faith. In addition, while deciding whether to buy a product, buyers constantly weigh the cost vs the benefits it provides. However, the impression of the advantages that the product provides, as well as the cost that customers are prepared to pay, varies from person to person, because each customer has unique personal characteristics and purchasing motives.

Customers that value cheap cost are more likely to agree to low-cost life insurance products to suit needs, such as a modest periodic insurance policy to avoid financial losses if they die. Customers that prioritize both financial security and savings will assess the advantages more than the expenses, claiming more benefits in an insurance policy. Customer service, on the other hand, has a substantial impact on the purchase decision. Because life insurance plans generally have big denominations and lengthy durations, most customers prefer to be treated by insurance agents who will look after their policies until maturity.

“Opinions of relatives” (=0,098 and sig.=0,03) and “Barriers to registering life insurance” (=0,098

and sig.=0,02) were the fourth and fifth degrees of influence, respectively. These two criteria have the least influence on customers' decisions to purchase life insurance in Hanoi. Customers' purchases of life insurance are influenced by their parents, family members, siblings, and spouses. Because each member of the family often earns income, the opinions of close relatives do not have a large impact on the choice to get life insurance, but they do have an impact. Aside from the fact that the interviewee is supported by friends and acquaintances, the percentage of families who are aware of insurance is a potential segment, and insurance companies, in addition to informing customers about insurance benefits, must pay attention to customers' family members (parents, wife, husband, children, etc.). For spouses, especially insurance collectors, it is necessary to know whether the object they collect is supported by the spouse or not; if so, the employee can be flexible and easily accessible; if not, the employee must patiently listen to the thoughts, aspirations, and problems of customers. With a coefficient of $\beta=0,098$, "Opinions of relatives" will increase by 1 unit, "Decision to purchase Life insurance" will increase by 0,098 units.

Furthermore, with the "Barriers of registering Life insurance" factor, customers frequently do not learn carefully or do not have enough information about insurance and in-surance contracts, which leaves customers ambiguous about the benefits they receive when participating in insurance as well as hesitating about the company's existence and long-term development. They do not trust the firm or the consultant because they are afraid of being duped. In fact, customers frequently choose to purchase life insurance from businesses that are entirely based in the United States. They are also concerned that if foreign enterprises fail and are forced to return home, they would be unable to retrieve their rights. Furthermore, there are numerous occasions when clients trust insurance firms but are skeptical of insurance brokers; there have been many cases where consultants defraud customers and then flee, causing widespread concern. Furthermore, some customers believe that the premium payment is excessive and that insurance is unnecessary. The average salary in Hanoi is fairly high, but the average expenditure in daily living is not low, so they must fulfill their urgent demands as well as take care of their family's daily activities. They are aware of the benefits of life insurance, but due to financial constraints, they are unable to participate. As a result, income is always a major consideration in people's actions. People who have financial conditions but have not yet participated in insurance because they want to invest in areas with more attractive profits, on the other hand, are usually qualified people, knowledgeable about many fields, and they accept high risks in order to have high profits, so insurance is not a particularly appealing form of investment. There are other consumers who believe that risks occur seldom in life and that purchasing insurance is unnecessary. This might be a client who is focused on satisfying current requirements and is unaware of unanticipated hazards, thus they believe that purchasing insurance is wasteful and unnecessary.

With the study and regression equations developed, all scales match the reliability standards, and the test demonstrates that the model is appropriate for the whole. The findings confirm that five factors influence customers' decisions to purchase life insurance in Hanoi, listed in descending order as follows: "Life events", "Motivates for purchasing Life insurance", "Company brand", "Opinions of relatives", and finally "Barriers to registering Life insurance". These characteristics all have a beneficial influence on consumers' purchasing decisions, thus insurers must optimize these elements at the same time in order to raise the quantity of insurance utilized.

According to the author's research, the factors influencing customers' decisions to purchase life insurance in Hanoi city were listed with high to low impact levels as "Life events," "Company brand," "Motivates for purchasing Life insurance," "Opinions of relatives," and finally "Barriers to registering Life insurance." This differs from Anh's (2017) Master's Thesis in Economics. The author shown in this study

that the component that had the most influence on the choice to purchase insurance was Service, followed by Barriers, Benefits and Reputation, and lastly Family Opinion. This is also in contrast to Hang (2016). The author argues that there are seven factors that customers say have the most effect on their choice to purchase life insurance: Perceptions of risk and profitability, Motivations for purchasing life insurance, Product value perception, Company brand, Consultant, Customer service and Previous life insurance product experience.

It is clear from all three research that the opinions of family and relatives do not play a significant role in influencing customers' decisions to purchase insurance. Customers' incentives for purchasing life insurance, on the other hand, have a significant role in influencing the choice to purchase insurance. This is reasonable because in Vietnamese families, the person who decides to purchase life insurance is often the breadwinner; they understand and grasp the benefits of insurance, as well as the necessity of insurance for themselves and their own families, ensuring both financial and health for the family.

However, it can be shown that, while variables in everyday life and brand image of insurance firms make for a substantial portion of customers' choice to acquire insurance in Hanoi, this is only moderately important and similar to Hue in Rach Gia. This occurs owing to geographical variances and people's varying perspectives on life. Previous research were done prior to the development of Covid-19; however, with the emergence of Covid-19, individuals began to be concerned about saving and hoarding more for life. People are increasingly paying more attention to health and life, living "slowly" to love themselves, therefore issues in everyday life also play an essential part in large decisions in Hanoi, the capital.

5.2. Recommendation

With Life events, to establish circumstances for clients to participate in insurance, the firm must advertise several insurance packages with reasonable premiums, have a large number of financial assistance programs, or offer insurance packages in a short period of time.

The consultant must explain to the consumer the difference in interest rates between the insured and the bank customer. Customers are being advised to increase the extra price while maintaining the basic fee. This allows clients to earn significantly at the conclusion of the premium payment period. Keeping the basic cost constant will not result in increased protection advantages.

With Motivates for purchasing Life insurance, raising public awareness of the advantages of life insurance. Life insurance companies should invest more in communication and propaganda about the value and benefits of life insurance, assisting clients in understanding that purchasing life insurance is for more than simply insurance. Protection when hazards arise, but also peace of mind because you are saving for your future and helping the country's socioeconomic growth.

With Barriers of registering Life insurance, insurance companies must take steps to carefully advise customers from the start about the benefits after signing the contract; consultants must improve their expertise, professional knowledge of insurance, and organize regular seminars, training classes, and market surveys to convey information and update customer inquiries. Open a customer care center 24 hours a day, 7 days a week to listen to and answer customers' questions. They must also simplify the method, or the consultant must grasp the customer's psychology, be adaptable, and settle the contract proactively rather than following the conventional way.

With Company brand, insurance businesses must improve their reputation in the insurance industry by making charity donations, participating in community activities, thoroughly answering client queries, and providing compensation. satisfactory. Do not let the company's image be harmed by its reputation. The most crucial component in the firm must be the service factor. Take note of all services. Organize

an employee evaluation of the best service provider of the month/quarter/year...in order to motivate and motivate staff to execute their responsibilities properly. It is critical to focus on developing a strong brand that is both the company's and the product's brand. Brand is reflected not only in financial strength, but also in various phases of the total, such as: service flooring, marketing, brand promotion, customer service...

With Opinions of relatives, insurance firms must pay attention to clients' family members (parents, spouses, children, etc.) in addition to telling them about insurance advantages. For spouses, especially insurance collectors, it is critical to understand whether the item they collect is supported by the husband; if so, the staff may be flexible and approachable. If the family does not support the object, the staff must carefully listen to their views and goals and respond to the customers' concerns. Cashiers in the family opinion segment are crucial since they have direct touch with this target demographic. As a result, they must be taught in vital abilities such as listening, communication, information reception, and persuasion. This individual must be well-versed in insurance in addition to doing the primary duty successfully. When consumers want advice, we are always ready to provide it.

6. CONCLUSIONS

In terms of theoretical contributions, there is a dearth of study for understanding predictors of life insurance purchase decisions in the HN city setting, despite the fact that several studies have noted this. This happens might due to the fact that un-foreseen dangers and risks in life is only recently becoming more and more con-cerned in Vietnam, so this research can serve as an example and a noticeable message for life problems. Moreover, the theory of consumer behavior is used in many different ways in pre-vious research for investigating different consumption behaviors and intention, so this study will contribute as an example of a valid model for further research with the same concern and provide a further look into different components of the theory.

Because the issue is limited, the research only looks at those who have purchased insurance. As a result, the following research must conduct a thorough survey and evaluation of both of these groups of individuals in order to ensure the topic's objectivity. More similar studies on a greater size and on a larger scale are required for a wider and more inclusive view. Furthermore, owing to time and resource constraints, this study constructs a model of factors influencing insurance purchase intent without intermediate/process variables, indicating a potential research topic.

ASSESSMENT OF THE IMPACT OF EXCHANGE RATE ON VIETNAM - EUROPE BALANCE OF TRADE

**Author: Phan Tran Mai Ngan¹, Do Dang Khoa¹, Tran Ngo Yen Nha¹,
Dang Thi Thanh Hang¹, Cu Van Nghi¹
Mentor: Mai Thi Cam Tu¹**

ABSTRACT: The balance of trade (TB) plays a very important role in the global economy because it allows countries to measure their level of development in the international economic arena. Which, the issue of exchange rate fluctuations affecting TB is one of the basic and focused issues in the macroeconomic policy of all countries in the world. Because of that, many authors have embarked on research to find out the factors that affect this object. This study assesses the impact of the exchange rate on the Vietnam-Europe trade settlement in the period 1994-2022, using Autoregressive Distributed Lag (ARDL) and Non-Linear Autoregressive Distributed Lag (NARDL). The results indicate that: The real exchange rate variable has a positive impact on trade equity in both the short and long run, similar to the variable of Vietnam's domestic value. In contrast, the European domestic value and the EVFTA Agreement dummy have a negative impact on the trade equity of both countries.

Keywords: Trade balance, Vietnam - Europe, Exchange rate, NARDL, GDPEU, GDPVN, EVFTA.

1. INTRODUCTION

Trade Balance (TB) plays an important role in the economy. A long-term trade deficit can affect a country's economy, leading to problems such as high unemployment and reduced incomes of businesses and individuals,... The importance of the Trade Balance has attracted the attention of many economic researchers. These studies provide governments and businesses with important information to make optimal and effective economic and trade policy decisions.

The exchange rate is also an important factor associated with the development and growth of the economy of all countries, including Vietnam. Therefore, many scientific works are studied to supplement the necessary scientific arguments to better see the overall picture of the impact of the exchange rate on the Trade Balance.

In addition, after reviewing several research papers, the authors make the following evaluations: Firstly, most research papers only have a single view of a particular subject or some related industry groups. Secondly, most research papers use familiar ECM, ARDL, and OLS models. Thirdly, the above studies are only general; few studies put these relationships in a specific context. Finally, the studies on the impact of exchange rates on the trade balance are inconsistent in terms of the sign, and for Vietnam-Europe, there are still many open questions.

Facing the above arguments, with the desire to make theoretical contributions on the theoretical basis of the Trade Balance between Vietnam and Europe as well as make suggestions in an optimal and effective way, the research team conduct a study on the topic "ASSESSMENT OF IMPACTS OF EXCHANGE RATES ON VIETNAM TRADE BALANCE BETWEEN VIETNAM AND EUROPE" as an urgent topic and contribute to filling these gaps.

The main objective of this article is to assess the impact of the exchange rate on the Trade Balance of Vietnam-Europe and propose a number of recommendations to improve the Trade Balance in the context of the current EVFTA agreement.

1 University of Economics and Law, Vietnam National University Ho Chi Minh City.

Consequently, the current paper seeks to contribute to the existing literature. Firstly, the study has added the necessary scientific arguments on the impact of the exchange rate on the trade balance between Vietnam and Europe and confirmed the important role of the exchange rate in the economic trade activities of a country by using updated data from 1994-2022. Secondly, to our knowledge, this is the first paper to use linear and nonlinear autoregression to analyze the impact of exchange rates on the trade balance between Vietnam and Europe in the context of the EVFTA agreement. Thirdly, the study provides necessary information and is a useful reference for policymakers, contributes significantly to the treasure of scientific research articles, and is also a valuable reference for future research related to the balance of trade. Finally, this study is also a prerequisite and necessary reference for the signing of other agreements in the future.

The next section of this study is organized as follows: section 2 presents the theoretical basis and proposes a research model; section 3 briefly explains the methods and data; section 4 analyzes the results and discussions; and section 5 includes conclusions and recommendations.

2. THEORETICAL FRAMEWORK

2.1. Theories

The relationship between Exchange Rates and Trade Balance has always been a primary concern for researchers. In this context, Trade Balance (also known as international trade) is the concept used to denote the total value of goods and services exported and imported by a country during a specific period, typically one year.

One of the significant theories regarding the relationship between exchange rates and Trade Balance is the theory of the elastic approach to Trade Balance studied in the BRM model. According to this theory, when inflation increases in a country, its currency depreciates compared to the currencies of other countries, which leads to an increase in the domestic value of goods and a decrease in the value of exported goods, resulting in enhanced imports and reduced exports, affecting the country's cash flow and Trade Balance. Additionally, when exchange rates fluctuate, such as a devaluation of the local currency, it makes the domestic currency cheaper, thus encouraging exports. Conversely, depreciation makes imported goods more expensive and restricts imports. The impact of currency depreciation on the Trade Balance is known as the Marshall-Lerner condition (ML). However, the ML condition does not explain why the Trade Balance remains in deficit after currency depreciation. After a certain period, the Trade Balance starts to improve. This phenomenon was discovered by Magee (1973) while studying the relationship between the exchange rate and the US Trade Balance. Magee (1973) identified the J-curve, which was later explained by Akbostanci (2004).

In the study of A. Rose and J. L. Yellen (1989), the authors have successfully built a two-country trade model in Economics. This paper has demonstrated a model to assess the dependence of demand for imported goods in the host country (foreign) on the real income of that country (foreign) and the relative price of imported and exported goods; TB depends on the real exchange rate; the real income of the host country; and real foreign income.

2.2. Literature review

The exchange rate is a crucial factor closely linked to the development and growth of an economy. Exchange rate fluctuations impact TB and are among the fundamental issues in the macroeconomic policies of every country worldwide, including Vietnam. Numerous researchers have studied the relationship between exchange rates and TB. During the literature review, the authors of this study categorized these previous research into three main groups, as follows:

Group one consists of studies that indicate that the exchange rate has no impact or only secondary effects on the Trade Balance. This group includes research conducted by Matiur Rahman et al (2010) in the Philippines using ADF-test, Nguyen Nhat Mai (2014) in Vietnam using the VAR method, Lan Huong Hoang (2016) in Vietnam with VECM & SVAR method, Essa Alhanom (2016) in Yemen using ARDL method, and Nguyen Hong Nga et al (2021) in Vietnam using ARDL and NARDL method.

Group two includes studies that demonstrate a negative impact of exchange rates on the Trade Balance. Some notable studies in this group are conducted by Thanh Hoan Phan and Ji Young Jeong (2015) in Vietnam using ARDL method, Tunaer Vural, B. M. (2016) in Türkiye using ECM, Muhammad Shahbaz et al (2014) in China using ADRL method, Eke et al (2015) using ADF-test and ECM method, Nguyen Quang My et al (2017) in Vietnam using ARDL and ADF-test method, Pham Thi Nga (2017) in Vietnam using Marshall-Lerner condition, Do Thi My Huong and Dang Thi Xuan Thom (2018) in Vietnam using ARDL, ECM and IRFs method, Cheng, K. M. (2019) in USA using ARDL, ADF & KPSS method, and My Linh et al (2020) in Vietnam using VAR & GARCH method.

Group three consists of studies that indicate a positive long-term impact of exchange rates on the Trade Balance. This group includes research conducted by Pham Thanh Hoan and Nguyen Dang Hao (2007) in Vietnam using Cointegration and ECM method, Swarnjit Arora et al (2010) in the USA using the ADRL method, Yusoff & Mohammed B (2010) in Malaysia using Cointegration and VECM method, Nguyễn Cẩm Nhung et al (2018) in Vietnam using VAR & IRF method, and Tran Thi Ha (2019) in Vietnam using ARDL and NARDL method.

2.3. An overview of previous studies and research hypotheses

The bilateral real exchange rate is calculated based on the nominal bilateral exchange rate under price adjustment between the two countries: $RER = \frac{eP^*}{P}$ (where e is the nominal bilateral exchange rate, P^* is the European Consumer Price Index, P is the Vietnam Consumer Price Index). According to the theory mentioned in equation (1), RER is known to have negative or positive effects on TB. In addition, according to the elastic approach to the Marshall-Lerner condition, the devaluation of the local currency will improve TB in the long run. If the approach of the J-curve is followed, the devaluation of the domestic currency will make the trade deficit in the short term and improve in the long term.

Besides, based on the collected studies, the authors found that there is no uniformity in the sign, specifically, some articles indicate that the exchange rate has a negative impact on TB such as: My Linh et al (2020), some other studies show a positive impact of exchange rate on trade finance: Pham Thanh Hoan and Nguyen Dang Hao (2007), Swarnjit Arora et al (2010), Yusoff & Mohammed B (2010), Nguyen Cam Nhung et al (2018), Tran Thi Ha (2019). Therefore, the authors come to the conclusion:

Hypothesis H1: The two-way real exchange rate (RER) is expected to have a multidirectional impact on the Trade Balance, which can be negative or positive.

$GDPVN_t$ not only represents the real domestic value of Vietnam's GDP over time but also represents the income of Vietnamese residents. According to the theory from equation (1), $GDPVN$ has a negative impact on the Trade Balance, more specifically, the trade balance of goods depends on the income of domestic and foreign residents.

When domestic residents' earnings tend to increase, the volume of imported goods also increases. Similarly, an increase in the income of foreign residents leads to a growth in the export of commodities, which negatively affects domestic TB. Swarnjit Arora et al (2010), Essa Alhanom (2016), Pham Thi Nga (2017), Tran Thi Ha (2019), and Nga Nguyen Hong et al (2021) also agree with this viewpoint. However, alongside these findings, some studies yield contrary results, such as Yusoff & Mohammed B (2010), Eke et al (2015), Nguyen Quang My et al (2017), Nguyen Cam Nhung et al (2018), and Nguyen Thanh Trung (2018).

$GDPEU_i$ represents the real domestic value of European GDP, representing the income of European residents over time. According to the theory from equation (1), an increase in the earnings of foreign residents will improve the TB. Some studies, such as Yusoff & Mohammed B (2010), Thanh Hoan Phan and Ji Young Jeong (2015), and Essa Alhanom (2016), also agree with this viewpoint. Therefore, the authors expect $GDPEU$ to have a positive impact on TB. However, other studies yield contrary results, including Eke et al (2015), Pham Thi Nga (2017), and Nguyen Thanh Trung (2018).

The theoretical expectation is that exports and imports increase when the real income of trading partners and domestic income correspondingly increase, and vice versa. In that case, the research group may expect $GDPVN < 0$ and $GDPEU > 0$. However, imports can decrease when income increases if the increase in real income increases the production of substitute goods, thereby reducing imports. In this case, the research group would expect $GDPVN > 0$ and $GDPEU < 0$.

Therefore, the authors expect that $GDPVN$ and $GDPEU$ have a multidirectional impact on TB, which can be positive or negative (H2&H3):

Hypothesis H2: The real gross domestic product of Vietnam (GDPVN) has a multidirectional impact on Trade Balance, which can be positive or negative.

Hypothesis H3: The real gross domestic product of Europe (GDPEU) has a multidirectional impact on Trade Balance, which can be positive or negative.

D_i is a dummy variable where $D = 1$ represents the state when the EVFTA agreement takes effect (2020-2022), and $D = 0$ illustrates the normal state (1994-2019). It captures the average difference in the dependent variable $\ln(X/M)$ during these two periods.

Hypothesis H4: The dummy variable D is expected to have an impact on Trade Balance.

(Source: Author's compilation)

3. RESEARCH METHOD

3.1. Research model

Based on the two-country trade model in the study of A. Rose and J. L. Yellen (1989) and the author's construction, we get:

$$TB = TB (RER, Y, Y^*) \tag{1}$$

From equation (1), we see the Trade Balance depends on the real exchange rate (RER); the actual income of the domestic country (Y); and the actual foreign income (Y*). The change in the real income of the host country will have a negative impact on the Trade Balance. Changes in the actual foreign income will positively impact the Trade Balance, and changes in the real exchange rate could have a negative or positive impact on the Trade Balance.

Starting from the original study by A. Rose and J. L. Yellen (1989) and referencing the model used in Bahmani-Oskooee and Baek (2016), which is based on the original work, the authors propose a research model on the impact of exchange rates on the Trade Balance between Vietnam and the EU as follows:

$$\ln\left(\frac{X}{M}\right) = \alpha_0 + \alpha_1 \ln(RER)_t + \alpha_2 \ln(Y_t^{VN}) + \alpha_3 \ln(Y_t^{EU}) + \epsilon_t \tag{2}$$

Where M_t represents the number of imports into Vietnam from the EU, X_t represents the volume of exports from Vietnam to the EU. Y_t^{VN} (Y_t^{EU}) is the actual income of Vietnam (the EU), RER_t is the bilateral real exchange rate.

As mentioned above, the authors focus on the exchange rate, the EVFTA agreement, or both; therefore, the authors proceed to add a dummy variable D into equation (2). We have:

$$\ln\left(\frac{X}{M}\right) = \alpha_0 + \alpha_1 \ln(RER)_t + \alpha_2 \ln(Y_t^{VN}) + \alpha_3 \ln(Y_t^{EU}) + \epsilon_t + \alpha_4 \ln D \tag{3}$$

Where D is a dummy variable that takes a value of 0 from 1994-2019 and 1 from 2020-2022.

Equation (3) is the long-term equation. Therefore, to evaluate the short-term, especially the short-term impact of the exchange rate (considering the J-curve effect), the research group adds the Autoregressive Distributed Lag (ARDL) method to equation (3). ARDL was developed by Pesaran et al (2001) as in equation (4).

$$\Delta(X/M)_t = \alpha + \sum_{j=1}^n \beta_j \Delta \ln X/M_{t-1} + \sum_{j=0}^n \delta_j \Delta \ln Y^{VN}_{t-1} + \sum_{j=0}^n \pi_j \Delta \ln RER_{t-j} + \sum_{j=0}^n \lambda_j \Delta \ln Y^{EU}_{t-1} + \theta_1 \ln X_{t-1} + \theta_2 \ln Y^{VN}_{t-1} + \theta_3 \ln RER_{t-1} + \theta_4 \ln Y^{EU}_{t-1} + D + \epsilon_t \tag{4}$$

The ARDL model has an advantage over equation (2) as it allows for analysis in both the short and long term. In addition, ARDL can be applied when time series data are cointegrated I(0) or I(1).

The real exchange rate and exports may be asymmetrical when the VND depreciates or appreciates. Therefore, we create two new variables representing the appreciation of the VND as POS and the depreciation of the VND as NEG as follows:

$$POS_t = \sum_{j=1}^t \Delta \ln RER^+_j = \sum_{j=1}^t \max(\Delta \ln RER_j, 0) \tag{5}$$

$$NEG_t = \sum_{j=1}^t \Delta \ln RER^-_j = \sum_{j=1}^t \min(\Delta \ln RER_j, 0) \tag{6}$$

POS is calculated as the sum of the partial appreciation changes of the Vietnamese Dong, and NEG is calculated as the sum of the partial depreciation changes of the Vietnamese Dong. According to Shin et al (2014), the authors replace the RER variable in equation (4) with the POS and NEG variables. We have:

$$\Delta X/M_t = \alpha + \sum_{j=1}^n \beta_j \Delta \ln X/M_{t-1} + \sum_{j=0}^n \delta_j \Delta \ln Y^{VN}_{t-1} + \sum_{j=0}^n \pi^+_j \Delta POS_{t-j} + \sum_{j=0}^n \pi^-_j \Delta NEG_{t-j} + \sum_{j=0}^n \lambda_j \Delta \ln Y^{EU}_{t-1} + \theta_1 \ln X/M_{t-1} + \theta_2 \ln Y^{VN}_{t-1} + \theta^+_3 POS_{t-1} + \theta^-_3 NEG_{t-1} + \theta_4 \ln Y^{EU}_{t-1} + D + \epsilon_t \tag{7}$$

Equation (7) is the nonlinear autoregressive distributed lag model (NARDL). Estimating the coefficients allows for analyzing the impact of exchange rate changes on the short and long-term Trade Balance. NARDL also allows for investigating the asymmetry of the changes in the real exchange rate concerning the export ratio.

3.2. Research Data

Variable names	Explanation	Previous authors	Expectation
Dependent variable			

In(X/M)	Natural logarithm of Vietnam-Europe Trade Balance	Pham Thanh Hoan and Nguyen Dang Hao (2007), Matiur Rahman et al (2010), Swarnjit Arora et al (2010), Yusoff & Mohammed B (2010).	
Independent variables			
InGDPVN	Natural logarithm of Vietnam's gross domestic product (GDPVN)	Nguyen Nhat Mai (2014), Eke et al (2015), Nguyen Quang My et al (2017), Do Thi My Huong and Dang Thi Xuan Thom (2018).	+/-
InGDPEU	Natural logarithm of Euro's gross domestic product (GDPEU)	Nguyen Nhat Mai (2014), Eke et al (2015), Nguyen Quang My et al (2017), Do Thi My Huong and Dang Thi Xuan Thom (2018).	+/-
InRER	Natural logarithm of the real exchange rate (RER)	Do Thi My Huong and Dang Thi Xuan Thom (2018).	+/-
D	Dummy variable representing the impact of the EVFTA Agreement	Group of authors	+

Table 3.1. Variable table*(Source: Author's compilation)*

3.3. Research sample size

Because of the limitation of data, the study used secondary data with a small sample size of $n=29$ from 1994–2022. Data was collected from International Financial Statistics (IFS), which is a reputable and official source of information worldwide.

3.4. Estimation method

The study used the Autoregressive Dispersion Latency (ARDL) model (Pesara et al. (2001)) and the Nonlinear Autoregressive Dispersion Latency (NARDL) model (Shin et al (2014).). This is completely consistent when previous studies also often used these two models to test the long-term cointegration of variables for studies with small sample sizes.

According to Pesaran (1997), ARDL method has many advantages over other cointegration methods. First, in the case of heterogeneous independent variables, ARDL allows heterogeneous independent variables to be used in the model. Second, ARDL can handle linear relationships between variables. Third, ARDL can handle cointegration relationships between variables. In addition, this NARDL has advantages as stated by Arize et al. (2017). First, this method provides an estimator of any number of arguments in the short run and the run time. Second, variables are required to be cointegrated such as $I(0)$ when using the OLS method and $I(1)$ cointegration, while using the VAR, ARDL and NARDL methods are applicable when the merge variable to $I(0)$ and $I(1)$.

4. RESULTS AND DISCUSSION

4.1. Results

4.1.1. Unit Root Test

Variable	ADF		PP		KPSS	
	Level	1st Difference	Level	1st Difference	Level	1st Difference
InRER	-1,072	-3,108	-0,835	-3,047	0,495	0,161
InGDPVN	-1,439	-3,866	-1,255	-3,857	0,867	0,185
InGDPEU	-1,341	-4,185	-1,338	-4,178	0,600	0,153
InX/M	-2,392	-3,915	-2,403	-3,996	0,456	0,394

Table 4.1. Unit Root Test

Because time-series data is used in this model, we first check the stationary of this data. The model's data must stop at level (non-differentiation) or first different for all variables.

Augmented Dickey-Fuller (ADF) test, Phillips-Perron (PP) test, and Kwiatkowski- Phillips-Schmidt-Shin (KPSS) test are used to check the stationarity at level and first difference for all variables. The results are reported in Table 4.1.

Table 4.1 shows the results of Unit Root Test with variables: lnRER, lnGDPVN, lnGDPEU, and lnX/M. The ADF and PP tests show that most of the variables have unit root or stop at the level or first difference. Additionally, we used the KPSS test for a more persuasive conclusion. The LM-Statistical in KPSS test shows all variables stationary.

Since all variables are non-stationary at lag 2, determining the optimal lag will be the next step for the model before conducting the ARDL and NARDL tests. There are five criteria for determining latency, specifically: Sequential modified LR test statistic (LR); Final prediction error (FPE); Akaike information criterion (AIC); Schwarz information criterion (SC) (Schwarz information criterion); and Hannan-Quinn information criterion (HQ). All five criteria above have the same rating for all variables.

Because no variables are integrated as I(2), determining the optimal lag is the next step before conducting ARDL and NARDL. The LR, FPE, AIC and HQ indicate lag 2, and SC indicate lag 1. Therefore, we used lag 2 as state as Akaike information criterion for conducting the model as in previous papers (Bahmani-Oskooee & Xu, 2012; Olowofeso et al, 2017; Khachatryan & Grigoryan, 2020).

4.1.2. ARDL test

Short-Run Estimates			
Lags	0	1	2
lnX/M		0,273	-0,618*
lnGDPVN	0,414	-2,637	3,506*
lnGDPEU	-1,751*		
lnRER	-1,837	0,827	3,073
D	-0,401	0,022	-0,803*
C	-7,948		

Note: *, **,*** indicate significant at 5%, 10% and 1% levels respectively.

Table 4.2. ARDL Short-Run

4.1.3. ARDL Bound Test Estimates

Test statistic	Value	Signif.	I(0)	I(1)
F-statistic	8,655376	10%	2,2	3,09
k	4	5%	2,56	3,49
		2,5%	2,88	3,87
		1%	3,29	4,37

Table 4.3. F-bound Test ARDL

As can be seen, F-statistic = 8,655376 is greater than the value of the lower limit I(0) and the upper limit I(1) at all four levels of 10%, 5%, 2,5% and 1% and the degree of precision. The estimated delay of the model is (2, 2, 0, 2, 2). This proves that the variables have a relationship in the long run.

4.1.4. Error Correction Model

ECM			
Lags	0	1	2
lnX/M		0,409*	
lnGDPVN	-0,930*	-1,900***	
lnGDPEU			
lnRER_NEG	-2,418*		
D	-0,499***	0,938***	
C			
CointEq		-1,174***	
Long-Run Estimates			
C		-5,908	
lnRER		1,534**	
lnGDPVN		0,954***	
lnGDPEU		-1,301***	
D		-0,878***	

Table 4.4. ECM

After noting the cointegration of the variables through the envelope test, the study estimates the short-term coefficients from the error correction model ECM based on the ARDL(2, 2, 0, 0, 1, 2). From the estimation results, it can be seen that the negative ECM coefficient (CointEq(-1) = -1,174360) with significance level of 1% represents the model adjustment towards long-term equilibrium.

The model results show that, lnGDPVN at lag 1, lnRER and dummy variable D are all statistically significant for short-term TB at 5%. The volatility of lnGDPVN and lnRER_NEG has a negative impact on the trade settlement, specifically when GDP of Vietnam increases by 1%, the Trade Balance decreases by 1,899084%, respectively, after 1 year. In other words, the current volatility of TB depends on the fluctuation of GDPVN one year ago, and when VND increases by 1%, TB will decrease by 2,417956% respectively.

In the short term, TB is improved thanks to dummy variable D at 1% statistical significance at lag 1, meaning that after EVFTA comes into effect, TB will be improved within one year afterwards. This is consistent with trade theory as well as the reality of Vietnam's foreign trade, in particular, Vietnam's main export products are mostly agricultural products. So this is a production lag to the change from the agreement.

Beside, we have: $EC = LNTB - (0,9537*LN\text{GDPVN} - 1,3014*LN\text{GDPEU} + 1,5338*LN\text{REER} - 0,8784*D - 5,9084)$

The long-term estimation results show that, at the 5% significance level, all variables are significant, in which the variable lnGDPVN and the real exchange rate lnRER have a positive impact on trade equity. More specifically, when GDP VN increases by 1%, TB will have a surplus of 0,953692% and when the real exchange rate increases by 1%, TB will have a surplus of 1,533765% respectively. This implies that when VND depreciates 1%, TB will improve by 1,533765%.

Meanwhile, the variable lnGDPEU and the dummy variable D have opposite effects on the trade settlement, when the GDPEU increases by 1%, the trade settlement decreases by 1,301430% respectively and the difference between the trade settlement under the EVFTA Agreement and in normal times is 0,878426 %. In other words, after the EVFTA Agreement is signed, in the long term, TB will deteriorate by 0,878426% compared to when the agreement has not been signed.

4.1.5. NARDL test

Part 1: Short-Run Estimates			
Lags	0	1	2
lnX/M		0,235	-0,409

lnGDPVN	-0,930	0,329	1,900
lnGDPEU	-0,971		
lnRER_POS	1,146		
lnRER_NEG	-2,418	5,051*	
D	-0,499*	0,096	-0,939*
C	5,000		

Table 4.5. Short-run NARDL

(Source: Author's compilation from Eviews 12)

4.1.6. NARDL Bound Test Estimates

Test statistic	Value	Signif.	I(0)	I(1)
F-statistic	7,018799	10%	2,08	3
k	5	5%	2,39	3,38
		2,5%	2,7	3,73
		1%	3,06	4,15

Table 4.6. F-bound Test NARDL

(Source: Author's compilation from Eviews 12)

F-stat = 7,018799, which is greater than the values of lower limit I(0) and upper limit I(1) at all four levels of 10%, 5%, 2,5%, 1%, and model latency the estimated figure is (2, 2, 0, 0, 1, 2). This proves that the variables have a relationship in the long run.

4.1.7. NARDL Long-Run

Part 2: Long-Run Estimates	
C	4,257
lnRER_POS	0,976
lnRER_NEG	2,242
lnGDPVN	1,105*
lnGDPEU	-0,827
D	-1,142*

Table 4.7. Long-run NARDL

(Source: Author's compilation from Eviews 12)

$$EC = LNTB - (1,1048 * LNGDPVN - 0,8272 * LNGDPEU + 0,9758 * LNREER_POS + 2,2422 * LNREER_NEG - 1,1415 * D + 4,2575)$$

In part 2, the long-term estimate shows that when GDP of Vietnam increases by 1%, trade fair will increase by 1,105% respectively and the difference between trade settlement when there is EVFTA Agreement and in normal time is 1,141528%. In other words, after the EVFTA Agreement is signed, in the long term, the TB will deteriorate by 1,141528% compared to when the agreement has not been signed.

Table 4.7 shows that although there is a clear difference between the variables lnRER_POS and lnRER_NEG, these variables are not significant, implying a symmetric exchange rate on the Trade Balance. To answer the above question in a more scientific way, the Wald test is used to detect evidence. In all cases it is hypothesized that H0, POS and NEG are symmetric.

4.1.8. Wald Test

	Test Statistic	Value	df	Probability
Short run of Export/Import	F-statistic	0,316779	(1,14)	0,5825
Long run of Export/Import	F-statistic	0,316779	(1,14)	0,5825

Table 4.8. Wald Test

(Source: Author's compilation from Eviews 12)

Table 4.8 presents the Wald test to check the model's asymmetry. As can be seen, all cases show chi-square probability greater than 1%, thus accepting hypothesis H0, implying a symmetric relationship in both short run and long run of the model.

4.1.9. Diagnostic Check

	RAMSEY Reset	Serial Correlation	Heteroskedasticity	Normality	CUSUM	CUSUMQ
ARDL	+	+	+	+	+	+
NARDL	+	+	+	+	+	+

+: Good; -: Bad.

Table 4.9. Diagnostic Check

(Source: Author's compilation from Eviews 12)

Table 4.9 presents the results of the diagnostic test for the linear and non-linear models of the study. As can be seen, the Breusch-Godfrey Serial Correlation LM test indicates there is no serial correlation; Ramsey Reset test shows that the model does not omit important variables and the model is suitable; The Breusch-Pagan-Godfrey test shows heteroskedasticity did not accompany the model. The normality check indicates the residuals are normally distributed on all of the models.

To test the stability of the model, the authors used the residual test: the cumulative sum of the recursive residuals (CUSUM) and the adjusted cumulative sum of the residuals (CUSUMQ). The results express parameters stability at CUSUM and CUSUMQ.

As a result, this model is still considered being good, meeting most of the test measures. The exchange rate is symmetrical in both the short run and the long run. NARDL supports a small exchange rate impact with Trace balance. Finally, the EVFTA Agreement negatively affects the Trade Balance between Vietnam and Europe.

4.2. Discussion

4.2.1. Impact of real bilateral exchange rate on Vietnam-Europe Trade Balance

The positive impact of exchange rate fluctuations on the Vietnam-Europe Trade Balance has been acknowledged. The research paper recognizes the positive effects of domestic currency depreciation on the Trade Balance in the short and long term. This finding is consistent with several studies conducted by Pham Thanh Hoan and Nguyen Dang Hao (2007), Swarnjit Arora et al (2010), Yusoff and Mohammed B (2010), Nguyen Cam Nhung et al (2018), and Tran Thi Ha (2019).

In fact, over the past nearly 20 years, the official exchange rate adjustments between the Vietnamese Dong (VND) and the US Dollar (USD) have consistently been in the direction of depreciating the VND

to align with the black market exchange rate. As a result, the nominal exchange rate of VND against USD has continuously increased. The State's maintenance of a policy of domestic currency depreciation in recent times aims primarily to improve the Trade Balance. And the result is that the Vietnam-Europe Trade Balance has experienced deficits only in the initial three years and has consistently been in surplus for over 20 subsequent years from 1994 until now.

Based on the theoretical foundations and previous research, as well as comparisons and correlations with empirical data, the authors recognize that the study results are accurate and, in other words, accept hypothesis H1.

4.2.2. Impact of Vietnam's Real Domestic Value GDPVN on Vietnam-Europe Trade Balance

The gross domestic product of Vietnam (GDPVN) represents the income of the domestic population. The research results indicate that the domestic value of Vietnam's GDP (GDPVN) positively impacts the Vietnam-Europe Trade Balance. This viewpoint is also supported by Yusoff & Mohammed B (2010), Eke et al (2015), Nguyen Quang My et al (2017), Nguyen Cam Nhung et al (2018), and Nguyen Thanh Trung (2018). However, the research results contradict the theory in equation (1).

In reality, over the past 20 years, despite the general upward trend in the domestic value of Vietnam's GDP, the Vietnam-Europe Trade Balance has remained consistently in surplus. The main reasons leading to this situation can be explained as follows: as GDPVN increases, people tend to import and consume more foreign goods, posing a trade deficit risk. However, due to the increasingly developed Vietnamese economy, the signing of numerous agreements, and the effective implementation of depreciation policies that have positive effects on the Trade Balance, as well as the relatively slow growth rate of Vietnam's GDP, export turnover has increased more than import turnover, resulting in a trade surplus over the years.

Based on the previous studies and comparisons and correlations with empirical data, despite the results contradicting the theoretical research, the authors still acknowledge that the research findings are accurate. In other words, we accept the hypothesis H2.

4.2.3. Impact of European Real GDPEU on Vietnam-Europe Trade Balance

As analyzed, the gross domestic product of Europe (GDPEU) represents the income of the European population. The research results indicate that the domestic income value of Europe has a significant and negative impact on the Vietnam-Europe Trade Balance. This shows that the increase in Europe's domestic income reduces the demand for Vietnamese goods. The research findings are consistent with certain empirical studies and the initial hypotheses proposed. Eke et al (2015), Pham Thi Nga (2017), and Nguyen Thanh Trung (2018) also agree with these results. However, the research results contradict the theory in equation (1).

These days, the European Union (EU) is a significant region in the trade relationship between Vietnam and Europe. Since 1997, the Vietnam-Europe Trade Balance has consistently been in surplus, with the surplus increasing over time. However, GDPEU showed signs of decline after this period, followed by continuous growth until 2008-2009, with a slight decrease due to the global economic crisis, followed by recovery and strong growth in subsequent periods. GDPEU fluctuates continuously, while the Trade Balance has consistently increased since 1997.

Based on the previous studies and comparisons and correlations with empirical data, despite the results contradicting the theoretical research, the group of authors still acknowledges that the research findings are accurate. In other words, we accept the hypothesis H3.

4.2.4. Impact of EVFTA Agreement dummy variable on Vietnam-Europe Trade Balance

The EVFTA Agreement dummy has a negative impact on Vietnam-Europe TB in both the short and long term. The authors found that from 2020 to 2022 after the agreement came into force, GDPEU and GDPVN both increased sharply. Research results show that GDP positively impacts TB, but the improvement is not enough to compensate for the deficit due to the adverse effects of GDPEU.

5. CONCLUSION

By effectively applying ARDL and NARDL models with annual statistical data from 1994 to 2022, this article has identified and analyzed the degree of impact of factors on Vietnam's overall Trade Balance, namely: gross domestic product of Vietnam; gross domestic product of Europe; bilateral real exchange rate; and the dummy variable D.

Based on the analysis above, the authors propose several policy implications for the government to improve Trade Balance, as follows:

Firstly, continue to implement a flexible exchange rate policy while enhancing the competitiveness of Vietnam's export and import goods.

Secondly, invest in and develop domestic production to enhance the competitiveness of inland goods and substitute imports.

Third, provide financial support policies for small and medium-sized enterprises, and support in the process of transforming into import-export enterprises in order to increase their competitiveness in the international market.

Fourthly, promote cooperation among export-oriented enterprises to strengthen currency exchange contract negotiations and mitigate difficulties arising from the exchange rate volatility.

Finally, promote high-quality products, increasing the competitiveness of Vietnamese exports in the world market.

THE NATIONAL LOGISTICS COMPETITIVENESS: THE CASE OF ASEM MEMBERS

Authors: Nguyen Dang Phuong Ngan¹, Tran Thi Le Chi¹, Nguyen Thi Quang Cam¹, Tran Tieu My¹

Mentors: Dinh Hoang Tuong Vi¹, Tran Duc Trung¹

ABSTRACT: *In the global business environment, the import and export activities of ASEM member countries play a pivotal role in their respective economies. Despite the emergence of new trends such as green logistics and digital transformation, the efficiency of the logistics industry has fallen short of expectations, as indicated by the lower Logistics Performance Index (LPI) rankings compared to other countries worldwide. The study undertook a comprehensive study employing both qualitative and quantitative methods to analyze secondary panel data for 14 countries from 2007 to 2018. The results revealed that the main factors impacting the logistics competitiveness of ASEM member countries include: (1) infrastructure; (2) labor force; (3) ease of arranging competitively priced international shipments; and (4) ability to track and trace consignments. These findings hold significant policy implications for ASEM members, offering valuable insights to enhance their position and active engagement within ASEM in both the short and long term.*

Key words: Logistics Performance Index, Logistics, Asia - Europe Meeting (ASEM).

1. INTRODUCTION

There are many different interpretations of logistics that approach the subject from various perspectives, leading to different content. Douglas et al. (1998) define logistics as “the process of delivering the right product to the right place, at the right time, under the right conditions, and at the right cost to the consumer”. Vu Thi Kim Hanh (2020) defines logistics as “a tool to link activities in the global value chain such as supply, production, distribution, and market expansion for economic activities”. According to Assoc. Prof. Dr. Doan Thi Hong Van & Pham My Le’s research, logistics is “the process of optimizing location and time to transport and store resources from the first point of the supply chain through the stages of production and distribution to the hands of the final consumer to meet consumer needs at a reasonable cost through a wide range of economic activities”.

In summary, there are many logistics concepts in Vietnam and around the world, and new logistics concepts emerged with the birth of industries, but Vietnamese law has yet to recognize a unified concept of logistics. However, logistics can be understood as the process of bringing products from the place of production to the consumer through different steps to optimize costs.

Le Thi Quynh Nhu (2017) stated that competitive capability is the ability to create a competitive advantage, expressed through internal resources including human resources, tangible assets, and intangible assets, through which core competencies must be created. The elements of logistics must be determined by the resources of the necessary infrastructure, technology, and workforce capacity, which are directly dependent on the institutional aspects (Arvis et al., 2018; Martí et al., 2014; Savvy, 2016). Accordingly, logistic competitiveness is the ability to create an advantage when performing logistics activities based on certain criteria, such as service quality, ability to carry out customs procedures. At the national level, logistics competitiveness is expressed through national resources such as the quality of education, human resources, and other national resources of that country.

Many researchers have used various indicators to assess a country’s level of logistics competition. D. Eggleton (1993) described the criteria to evaluate the effectiveness of logistics activities, which are employee satisfaction, customer satisfaction, and the company’s rate of return. However, the use of the term logistics

¹ University of Economics and Law, Vietnam National University Ho Chi Minh City.

efficiency at the national level refers to the national scope. Accordingly, the World Bank established the logistics efficiency and competitiveness index - LPI in 2007 to determine the efficiency of each country's logistics operations. This index is derived from a survey among freight forwarders, carriers, and carriers operating in the country. Accordingly, logistics factors affect national logistics efficiency (Keng Lin Soh, Wai Peng Wong, Chor Foon Tang, 2021). In addition, according to the connectivity efficiency of economic corridors analyzed through the World Bank's logistics report, the LPI is considered by researchers and practitioners as a unique tool to solve the link between logistics processes and international trade (Arvis et al., 2018).

Therefore, the objectives of the study include: (1) Determining the economic factors affecting the logistics competitiveness of ASEM member countries; (2) Analyzing the degree of influence of these factors on the logistics competitiveness of ASEM members; (3) Proposing solutions to improve the logistics competitiveness of member countries in ASEM based on the results of the analysis of influencing factors.

This study is breaking new ground in its empirical investigation of the connections between LPI and its underlying factors at a global level by utilizing a panel data approach. The research offers two significant contributions. Firstly, it enhances the frontier of knowledge in logistics research by incorporating P.E.S.T. analysis to explain how logistics is linked to national economic and social indicators, which can substantially extend previously published research findings. Secondly, the study's findings are essential for providing guidance to governments on how to foster, enhance, and integrate national social and economic policies to achieve global LPI.

The subsequent sections of this paper are structured as follows: Section 2 offers a review of prior research and discusses the conceptual framework employed in this study. Section 3 presents the empirical model, data, and econometric methods utilized in this research. Section 4 provides a critical assessment of the empirical findings, while the conclusion will be presented in Section 5.

2. LITERATURE REVIEW AND THEORETICAL FRAMEWORK

2.1. Literature Review

Logistics has become a research area that has received a lot of attention in recent years. However, the number of studies related to logistics performance and competitiveness is still limited.

The study "Factors affecting logistics performance in Asia - Some suggestions for Vietnam" by Tran Nguyen Hop Chau and Trinh Thuy Trang (2022) has shown that 5 out of 9 factors in the research model have a positive impact on the indicator of national logistics efficiency and competitiveness, including political stability, industrial share in GDP, per capita income, technology, and elements bordering the sea.

Besides, according to the study "Discussing Competitiveness of Vietnam Logistics Industry" by Vu Thi Kim Hanh (2020), factors including customs, infrastructure, service quality, inspection and tracking, timeliness, time and international shipments, have a beneficial impact on logistics efficiency.

According to the study "The major determinants of logistics performance in a global perspective: evidence from panel data analysis" by Wai Peng Wong and Chor Foon Tang (2018), factors such as infrastructure, technology, human resources, and education play an important role in improving logistics efficiency because the logistics industry cannot operate without these factors. In addition, the results also show that institutional quality factors, including political stability and corruption perception, also contribute to improving logistics capacity. Specifically, low corruption rates and high political stability will help improve logistics efficiency, thereby enhancing national logistics capacity.

The studies of Birol Erkan (2014), Daniel Y. Lee et al (2017), Burmaoglu Serhat, and Sesen Harun (2021) all have some similarities with the research results of Wong and Tang (2018). All of these studies reveal the importance and influence of infrastructure on logistics competitiveness. However, according to Y. Lee et al (2017), besides infrastructure, the government's priority industrial development policy, information network structure, and the growth of the logistics market also have a significant impact on national logistics performance.

According to Burmaoglu Serhat and Sesen Harun (2021), besides infrastructure (including transport infrastructure and information technology), other factors also positively affect logistics competitiveness, such as customs, inspection and tracking, timeliness, and international shipments. However, infrastructure and customs are the two most important factors to be enhanced to improve the country's logistics competitiveness. Additionally, the research of Ona Graina Rakauskien et al. (2022) shows that institutions are considered a foundation for economic corridors to have a positive impact on national logistics performance and competitiveness.

Lastly, the conclusions of Samet Guner and Erman Coskun's (2012) study also highlighted factors influencing the logistics competitiveness of 26 OECD member nations, including GDP, political risk, human development, and democracy. Political risk is specifically evaluated using factors including political stability, regulation quality, government quality, the weight of the masses' voice, and government accountability.

2.2. The P.E.S.T Analysis

P.E.S.T analysis was introduced by Aguilar in 1967 to assess the influence of factors in the macroenvironment on the development of an industry. The acronym "P.E.S.T" stands for political, economic, socio-cultural, and technological factors that exert both direct and indirect influence on businesses operating in any industry, relating to the macro-environment (Ward & Rivani, 2005; Mohamed et al., 2010). These factors are:

P (Political): Including political and legal factors relevant to the particular industry.

E (Economics): Including economical factors relevant to the study of a particular industry.

S (Sociocultural): Socio-cultural factors impact people's perceptions.

T (Technological): Including technological factors for the business industry.

According to Pulaj and Kume (2013), P.E.S.T analysis is a strategic tool that allows businesses to assess the external environment from a panoramic perspective, offering a comprehensive understanding of the industry. It is a vital instrument for tracking trends and changes occurring in the external context. In other words, P.E.S.T factors encompass uncontrollable elements that can either present opportunities or pose threats to firms and industries.

Peng and Nunes (2007) proposed that P.E.S.T analysis serves two primary functions. The initial function involves examining the status or situation of a specific company or industry, while the second function entails assessing the viability of broad management solutions within a business setting. P.E.S.T analysis is described as a method for recognizing and assessing external opportunities and threats, thereby enabling organizations to establish distinct missions, formulate strategies, attain long-term goals, and devise policies for achieving annual objectives. Various studies have applied P.E.S.T analysis in different sectors. For example, Darkow (2010) used the P.E.S.T method to analyze the logistics industry. Similarly, Lao and Jiang (2009) conducted P.E.S.T analysis on online payment services, and Yingfa and Hong (2010) examined e-government using P.E.S.T analysis.

P.E.S.T analysis has certain limitations. According to Lynch (2012), compiling an exhaustive list of factors would yield insignificant results and demonstrate a lack of serious consideration in the strategic management process. Furthermore, Burt et al. emphasized that the absence of interrelationships among variables poses challenges in comprehending how these factors influence the environment. On the other hand, Gracht and Darkow (2010) found that employing P.E.S.T analysis enables more accurate predictions for unexpected situations and can be considered a valuable foundation for strategy development. This finding aligns with Lynch's (2012) study that, despite its reliance on previous experiences, P.E.S.T analysis can be employed as a forward-looking forecast.

Within the scope of the research, the authors select a group of political, economic, socio cultural and technological factors. In the context of this study, the political element is political stability, while the economic factor is GDP growth and the social factor is the labor force. The ability to track and trace, ease of arranging prices, and infrastructure are technological factors. These factors affect the logistics industry in both short-term and long-term aspects. Hence, businesses should consider these factors when making an investment decision.

2.3. Theoretical Framework

Political Stability (PS)

Political stability is a crucial indicator for evaluating a country's institutional quality (Kaufmann, Kraay, and Mastruzzi, 2010). According to Tran Nguyen Hop Chau and Trinh Thuy Trang (2022), a country's level of political stability reflects the certainty and steadiness of its governmental policies. Additionally, Wong and Tang (2018) state that a stable political environment demonstrates the sustainability and integrity of the current government regime, which in turn promotes economic activities, including logistics.

H₁: Political Stability has a positive impact on the country's logistics performance and competitiveness index LPI.

GDP Growth (GDPG)

The International Monetary Fund (IMF) defines GDP as the total monetary value of final products and services produced in a country during a specific time period. The growth of GDP is a crucial indicator of the economy's health and is considered a criterion for assessing a country's economic development. According to Li et al. (2010), logistics capacity and economic growth are interconnected. Mohammad Reza's research findings (2013) further establish a close relationship between logistics and economic development. Logistics performance and economic growth have a mutually reinforcing relationship (Sipos and Bizoi, 2014). In other words, the growth of the national economy promotes and improves logistics efficiency, and vice versa. Therefore, there is a positive correlation between GDP growth and a country's logistics competitiveness.

H₂: GDP growth has a positive impact on the country's logistics performance and competitiveness index LPI.

Labor Force (LABOR)

The World Economic Forum (2014) defines labor resources as the availability and skill set required for workers to perform their duties effectively. Nguyen Thi Thuy Dung and Ngo Nu Mai Quynh's (2020) research indicates that the labor force factor is the most significant determinant of logistics capacity for businesses and the country as a whole. Moreover, according to Wai Peng Wong and Chor Foon Tang (2018), a well-functioning labor market is crucial for the sustainable development of the national economy.

Sustainable development leads to increased trade, exports, and competitiveness, resulting in an improved logistics efficiency index (LPI) for the country. Therefore, the labor force factor has a synergistic impact on the logistics competitiveness of the country.

H₃: Labor force has a positive impact on the country's logistics performance and competitiveness index LPI.

Ability to track and trace consignments (TRACK)

The World Bank defines the ability to track, trace, and locate international shipments (Track & Trace) as one of the essential factors in analyzing a country's logistics competitiveness through the LPI index. An effective Track & Trace system will improve the management of logistics networks, thus enhancing the country's logistics competitiveness. Studies by Burmaoglu Serhat & Sesen Harun (2021) and Vu Thi Kim Hanh (2020) indicate a strong correlation between the ability to track, trace, and locate international shipments and a country's logistics competitiveness. Thus, the capacity to track, trace, and locate international shipments positively impacts a country's logistics competitiveness.

H₄: Ability to track and trace consignments has a positive impact on the country's logistics performance and competitiveness index LPI.

Ease of arranging competitively priced international shipments (PRICE)

The World Bank defines the ease of arranging competitively priced international shipments as one of the factors used to analyze a country's logistics competitiveness through the LPI index. The ease of arranging competitively priced international shipments enables businesses and the national economy to save costs in the logistics chain by streamlining production and business processes, thereby enhancing the country's logistics competitiveness. Vu Thi Kim Hanh's (2020) research indicates a direct correlation between easier arrangements at competitive prices and a country's logistics competitiveness. Therefore, the ease of arranging competitively priced international shipments has a positive impact on a country's logistics competitiveness.

H₅: Ease of arranging competitively priced international shipments has a positive impact on the country's logistics performance and competitiveness index LPI.

Infrastructure (INF)

According to Daniel Y. Lee (2017), infrastructure is a crucial factor in evaluating logistics performance at the macro level. Furthermore, there is a positive correlation between logistics and infrastructure capacity, including seaports, railways, roads, and information technology (Burmaoglu Serhat, Sesen Harun, 2021). Beysenbaeven (2018) further states that investment in infrastructure has a close relationship with logistics efficiency, contributing to improving a country's logistics competitiveness. Studies by Vu Thi Kim Hanh (2020), Wai Peng Wong and Chor Foon Tang (2018), and Birol Erkan (2014) also show a strong link between LPI and infrastructure. Thus, the infrastructure factor has a positive impact on a country's logistics competitiveness.

H₆: Infrastructure has a positive impact on the country's logistics performance and competitiveness index (LPI).

The above discussion on determinants is closely related to the P.E.S.T. analysis. The P.E.S.T. Analysis explains the macro factors, including political, economic, sociocultural, and technological factors, that would sustain a country's logistics competitive performance.

In the context of this study, the macro variables are infrastructure, labor, and political stability. These are expected to improve logistical competitiveness to benefit the national economy by attracting businesses

and eventually increasing the GDP (Hanouz, Geiger, and Doherty 2014). Based on the P.E.S.T. analysis, we develop a conceptual framework, as presented in Figure 1, to assist and rationalize the specification of our model to understand the behavior of LPI.

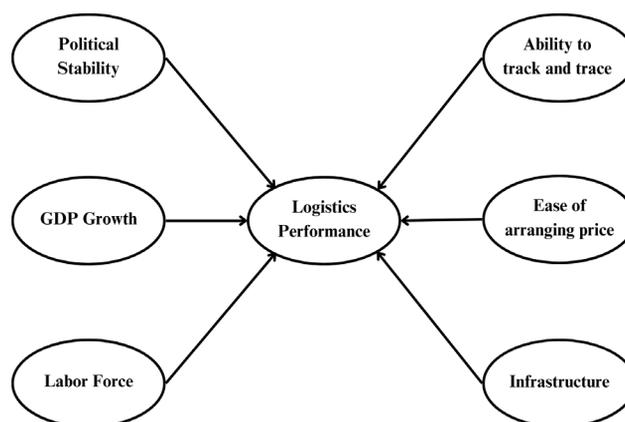

Figure 1. Conceptual framework for logistics performance.

3. DATA AND RESEARCH METHOD

3.1. Data

The data in the research paper belongs to secondary data and was collected from the years 2007, 2010, 2012, 2014, 2016, and 2018. The choice of countries and sample period is mainly determined by the availability of data. The LPI index released by the World Bank is updated every two years, in even years (except 2007) and the last time in 2020, while other indicators such as customs clearance efficiency and border management are updated to 2018. Therefore, after considering, in order to avoid incomplete input data affecting the research results, the research team decided to choose the data set from 2007, 2010, 2012, 2014, 2016, and 2018 so that the research results create consistency and high accuracy. Data on LPI factors, including ability to track and trace consignments, ease of arranging competitively priced international shipments, political stability, labor force, and GDP growth, were obtained from the biennial Logistic Performance Index (LPI) Reports and the World Governance Indicators of the World Bank. The data on the competitiveness index to measure the efficiency and availability of infrastructure was collected from various publications of the Global Competitiveness Reports by the World Economic Forum. All data were transformed into natural logarithms to standardize the measurement and minimize the heteroskedasticity problem. The descriptive statistics of the variables under investigation are displayed in Table 1.

3.2. Research methodology

Regression Model (Pooled OLS)

The Pooled OLS model is the simplest, most rudimentary approach to panel data. Gujarati & Porter (2009) assume that the regression coefficients (intercept and slope) do not change in space and time. Furthermore, the independent variables are strictly exogenous. A variable is said to be strictly exogenous if it does not depend on the past, present, and future values of the random error.

Fixed-effects model (FEM)

The fixed effects regression model, which is an extension of the classical linear regression model, is given by:

$AND_{it} = b_1X_{it1} + b_2X_{it2} + \eta_i + \epsilon_{it}$ where $u_{it} = \eta_i + \epsilon_{it}$. The error of the classical linear regression model is separated into two components, including: (1) the ν component represents unobservable factors that differ between subjects but do not change over time, (2) the ϵ component, which represents unobservable factors that vary between subjects and change over time.

There are two methods used to estimate the parameters of the fixed effects model, including: (1) regression of minimum dummy variables (fixed effects Least-Squares Dummy Variable (LSDV), with each dummy variable representing each subject of the sample, (2) Fixed Effects Estimator

Random effects model (REM)

Considering the economic relationship with the dependent variable Y, the two observable explanatory variables X1 and X2, and one or more unobservable variables Panel data includes N subjects and T time points, (NxT) of observations. The random effects model is written as follows:

$AND_{it} = b_1X_{it1} + b_2X_{it2} + \eta_i + \epsilon_{it}$ ($i = 1, 2, \dots, N$ and $t = 1, 2, \dots, T$), where the classical error is divided into two components, including: (1) the ν component represents unobserved factors that differ between subjects but do not change over time. In which $\eta_i = \alpha_0 + \omega_i$ ($i = 1, 2, \dots, N$) includes the uncertainty component α_0 and the random component ω_i . (2) Ingredients represent unobservable factors that vary between subjects and change over time.

Selections of Pooled OLS, FEM and REM model

The selection of a suitable model Pooled OLS, FEM, or REM is verified on the basis of the F-test, the Breusch-Pagan LM test, and the Hausman test.

(1) Selecting the Pooled OLS or FEM model: The FEM fixed effect estimate was verified by Gujarati (2009) by the F-test with the hypothesis:

H0: All coefficients β are zero

H1: Is there at least one non-zero coefficient β

(2) Selecting a Pooled OLS or REM model: The REM random effect estimate was tested by Baltagi (2008) using the Breusch-Pagan Lagrange Multiplier method (Breusch-Pagan LM Test) with the hypothesis:

H0: All coefficients β are zero

H1: Is there at least one non-zero coefficient β

(3) Selection of FEM or REM model: Hausman test (1978) is used to select FEM or REM model (Baltagi, 2008; Gujarati, 2004) with the hypothesis:

H0: The estimates obtained from the two methods are not different.

H1: The estimates obtained from the two methods are distinct.

Generalized Least Squares method

To achieve efficiency for the model, the GLS (Generalized Least Squares) method was applied. According to Nguyen Thi Lien Hoa and Bui Thi Bich Phuong (2014), using the FGLS method helps control phenomena related to autocorrelation and variable variance. The model will be estimated by the GLS method, and the errors from the final result will be used to estimate the variance matrix and covariance of the error. Using this matrix, the results will be converted back to the original variables, allowing for estimation of the parameter values of the model.

4. RESULT AND DISCUSSION

4.1. Result

In this section of our study, we will analyze and discuss the outcomes obtained from our LPI model, after providing an explanation of the model specification, data, and panel data estimation procedures used in our research.

Table 1. Summary of descriptive statistics.

Variables	Mean	Std. Dev.	Min	Max
ln(LPI)	1.267	0.126	0.989	1.441
PS	0.315	0.870	-1.65	1.496
GDPG	4.296	2.944	-1.25	14.52
LABOR	64.683	6.005	50.357	78.563
ln(TRACK)	1.284	0.126	0.975	1.472
ln(PRICE)	1.236	0.096	1.02	1.398
ln(INF)	1.609	0.234	0.992	1.902

Table 2 presents the estimated outcomes for three models: POLS, REM, and FEM. Before critically evaluating the coefficients, we must select an appropriate model. Diagnostic tests in the second part of Table 2 show computed R-squares ranging from 0.9598 to 0.9765, indicating a good fit for the data across all models. This observation is supported further by the overall F-test. The computed R-squares indicate that over 90% of the variation in the behavior of LPI can be explained by the explanatory variables, regardless of the estimation model used. The signs of the estimated coefficients are mostly consistent across all models. These findings demonstrate that our LPI model is appropriately specified and deserves further analysis.

Subsequently, we conducted three significant specification tests to determine the most appropriate model for further analysis. Table 2 shows the results of the specification tests, indicating that the null hypothesis associated with the POLS are rejected by the outcome of the Poolability test, and therefore, at a significance level of 1 percent, the FEM is deemed more appropriate for our study. Additionally, the findings of the Hausman test indicate that the null hypothesis associated with the FEM is more reliable and efficient compared to the REM. Based on these specification test results, it can be concluded that the coefficient estimates obtained from the POLS and REM are inconsistent and biased, rendering the results obtained from these models invalid. Consequently, the results from the FEM should be utilized for analysis. Nevertheless, we identify that the FEM is susceptible to heteroskedasticity issues, which have the potential to encounter bias when drawing statistical inferences. In order to tackle this concern, we have taken steps to re-estimate the model utilizing the Generalized Least Squares (GLS) method. The outcomes of this re-estimation can be observed in the final column of Table 2.

Table 2. The results of the logistic performance panel regression model.

Variables	POLS	FEM	REM	GLS
PS	0.005 (0.038)	-0.011 (0.012)	0.008* (0.005)	0.003 (0.002)
GDPG	-0.0007 (0.001)	-0.0007 (0.001)	-0.0008 (0.001)	-0.0006 (0.0005)

LABOR	0.0005 (0.0004)	-0.0002 (0.001)	-0.0005 (0.0005)	0.0008** (0.0003)
ln(TRACK)	0.533*** (0.043)	0.398*** (0.041)	0.514*** (0.043)	0.562*** (0.032)
ln(PRICE)	0.365*** (0.047)	0.345*** (0.041)	0.365*** (0.047)	0.353*** (0.033)
ln(INF)	0.106*** (0.020)	0.046** (0.022)	0.098*** (0.021)	0.113*** (0.018)
Constant	-0.0715* (0.042)	-0.275** (0.094)	-0.033 (0.049)	-0.125** (0.042)
Diagnostic tests				
Observations	84	84	84	84
R-squared	0.9765	0.9598	0.9763	
Overall F-test	533.47***	74.32***	2146.95***	4856.11***
P – value	0.0000	0.0000	0.0000	0.0000
Poolability test (POLS and FEM)	5.58*** [0.0000]			
Hausman test (FEM and REM)			61.33*** [0.0000]	
Heteroskedasticity test		384.68*** [0.0000]		

*Note: The symbols ***, ** and * represent the level of significance at 1%, 5% and 10% respectively. The values in parentheses (.) indicate the standard error, while the values in square brackets [.] represent the p-values.*

Consistently as anticipated, the findings align with our initial expectations, indicating that the estimated coefficients positively influence LPI (Logistic Performance Index). Furthermore, these coefficients exhibit statistical significance at conventional levels of significance (i.e., 1%, 5%, and 10%). We observe that LPI is influenced by input factors, specifically the level of infrastructure and the percentage of labor force participation. These factors are crucial for enhancing LPI, as the logistics industry relies on them for efficient operations. A 1% increase in infrastructure and labor force participation would result in approximately a 0.113% and a 0.0008% improvement in LPI, respectively.

In addition to the input factors, two other variables, namely the ease of arranging competitively priced international shipments (PRICE) and the ability to track and trace consignments (TRACK), play significant roles in explaining LPI behavior. The estimated coefficients for TRACK and PRICE are 0.562 and 0.353, respectively. This implies that a 1% increase in TRACK and PRICE, on average, leads to a 0.562% and a 0.353% improvement in LPI, respectively. It is evident that the ease of arranging competitively priced international shipments (PRICE) and the ability to track and trace consignments (TRACK) are important determinants of LPI behavior.

4.2. Discussion

Our findings highlight the importance of input factors such as infrastructure and labor force in supporting the logistics process and enhancing LPI. These results align with the perspective of Guner

and Coskun (2012), who also emphasize the effect of economic inputs on logistics competitiveness. The findings also validate the perspective expressed by Wong and Chor Foon Tang (2018), who argue that an efficient labor market is essential for the long-term growth of the national economy. They have stated that sustainable development leads to enhanced trade, exports, and competitiveness, ultimately resulting in a higher logistics efficiency index (LPI) for the country. However, this is not the complete picture, as our findings reveal that improving the ease of arranging competitively priced international shipments and the ability to track and trace consignments are crucial for enhancing logistical competitiveness. This is because a higher level of ease in arranging competitively priced international shipments and a stronger ability to track and trace consignments can significantly improve efficiency and ensure sustainable LPI. In fact, Vu Thi Kim Hanh (2020) and Burmaoglu Serhat & Sesen Harun (2021) also support this notion, noting that a better ease of arranging competitively priced international shipments and an enhanced ability to track and trace consignments can enhance national logistics competitiveness.

Hence, while infrastructure and labor can positively influence LPI, their impact is contingent upon the local government's and logistic companies' ability to improve the ease of arranging competitively priced international shipments and the ability to track and trace consignments within the national logistics system.

5. CONCLUSION

This study examines the key factors that have an impact on the behavior of LPI using unbalanced panel data from 14 countries. The empirical findings suggest that countries that possess resources such as infrastructure and labor, as well as capabilities such as the ease of arranging competitively priced international shipments and the ability to track and trace consignments, are capable of improving their logistics processes and thereby successfully enhancing their national logistics competitiveness. Nevertheless, it is crucial to acknowledge that although these inputs are essential, they are not adequate on their own to achieve a significant overall improvement in LPI.

The policy implications of the findings suggest that the ease of arranging competitively priced international shipments and the ability to track and trace consignments play a critical role in determining macro-level logistic competitiveness. To enhance the ability to track and trace consignments, it is recommended that ASEM member countries focus on improving the quality of transport and information infrastructure. Measures such as digitization and automation can be implemented to streamline processes, reduce processing time, and enhance efficiency by minimizing errors. Moreover, to improve the ease of arranging competitively priced international shipments, ASEM member countries should utilize electronic data interchange (EDI), which facilitates seamless data connectivity between businesses. By adopting EDI, trade-related data can be efficiently exchanged, leading to smoother logistics operations. Additionally, stakeholders in the logistics industry and governments should ensure the availability and accessibility of all trade-related resources. This includes investing in necessary infrastructure, promoting collaboration between industry players, and implementing supportive policies. These efforts are crucial for enhancing competitiveness and sustaining superior LPI within the ASEM region.

This research makes two important contributions. Firstly, it expands the existing knowledge in logistics research by incorporating P.E.S.T. analysis, which examines the connections between logistics and national economic and social indicators. This integration significantly enhances our understanding of the subject and extends the scope of previously conducted research. Secondly, the findings of this study serve as a valuable basis for assessing and analyzing the logistics competitiveness of a country. They provide economic researchers and strategic planners with valuable insights into the competitiveness of a nation's

logistics sector. These insights are crucial for guiding governments in fostering, enhancing, and integrating national social and economic policies to achieve global logistics competitiveness. In summary, the research findings contribute to the body of knowledge in logistics research and provide important guidance for policymakers aiming to promote and strengthen their country's logistics sector, thereby improving national competitiveness on a global scale.

However, the present study has two limitations that can serve as opportunities for future research on the same topic. Firstly, in terms of data, the study relied on available datasets from various sources, such as the World Bank, the World Economic Forum, and other resources. However, it is important to note that certain specific details may not have been updated during the course of the investigation. Additionally, there may be limitations in the proactive generation of information and incomplete data sources. Moreover, disparities in data collection methods across countries can potentially impact the study's results. Secondly, in relation to the scope of the research, the study encounters challenges in terms of the availability of measurement standards for evaluating logistics competitiveness across ASEM region countries. This lack of standardized measurement may result in the research findings not providing comprehensive coverage of all aspects related to logistics and competition. Furthermore, it is crucial to acknowledge that the study primarily focuses on a select number of ASEM member countries, which implies that the results and recommendations may not be universally applicable to all ASEM members. These limitations indicate potential areas for further investigation, such as addressing data gaps and inconsistencies, developing standardized measurement standards for logistics competitiveness, and broadening the scope of analysis to include a more comprehensive range of ASEM member countries. By addressing these limitations, future research can contribute to a more robust understanding of logistics competitiveness and its implications in a broader context. Further research could expand the analysis by incorporating the dynamics of logistics competitiveness through the utilization of the dynamic panel GMM estimator. Nonetheless, this approach would necessitate the availability of ample and suitable data to facilitate accurate estimation. Despite these limitations, our findings have provided a comprehensive explanation for LPI behavior.

AN ANALYSIS OF FOREIGN DIRECT INVESTMENT AND SUSTAINABLE DEVELOPMENT IN DEVELOPING COUNTRIES FROM 1990 TO 2019

Author: Cao Man Nhi¹

Mentor: MBA Hoang Thi Que Huong¹

ABSTRACT : This research is carried out to investigate the impacts of foreign direct investment (FDI) on three pillars of sustainable development in 32 developing countries. The three pillars include economic growth, income distribution, and environmental quality. The research relies on annual data from developing countries from 1990 to 2019. Throughout researching and testing data process, the panel-corrected standard errors (PCSE) method is executed. Results show that FDI promotes economic growth in developing countries, but creates income inequality and more CO₂ emissions to the environment. Besides the main variables of the research, other variables such as per capita energy consumption (EN) and domestic investment (DI) also affect sustainable development in developing nations. The research also proposes recommendations for developing countries to promote sustainable development paths.

Keywords: Foreign direct investment (FDI), sustainable development, economic growth, income distribution, environmental quality, developing countries.

1. INTRODUCTION

According to the International Monetary Fund (IMF), investments which are to establish enterprises in other economies and to build long-term relationships and returns for the direct investors and host countries, are called Foreign Direct Investment (FDI). FDI has been receiving significant attention worldwide and is considered an important factor of impressive economic growth in a wide range of developing nations (Anwar and Lan, 2010). According to The United Nations Conference on Trade and Development (UNCTAD) (2021), developing countries have received a larger amount of FDI inflows, an increase of 30% in 2021. FDI has played a significant role in providing investment capital and promoting export growth over time. It also has created a more comprehensive range of diversity and competition in the market (Anwar and Lan, 2010). In Africa, foreign investment is considered one of the primary sources of funds; thereby, these countries execute many attractive policies to attract FDI (United Nations, 2005). However, FDI also brings risks for the host countries in the industrialization process. In fact, FDI enterprises may become big players in the host developing nations and push local companies out of the market. Moreover, FDI companies can take advantage of weak regulation and bring capital back to developed countries (Jones, 1996). There are also many FDI corporations taking advantage of the lax environmental law and posing dangerous threats to the natural environment and human life. Notably, multinational corporations are manufacturing companies with large scale of production. This causes serious problems to the environment (Bora, 2002). More importantly, FDI may also worsen the income inequality gap in many countries. Thus, the impacts of FDI on host developing economies are still controversial.

On the other hand, according to the UNCTAD (2014), FDI is considered one of the potential factors to boost sustainable development. Sustainable development means “development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (the World Commission on Environment and Development, 1987). Munasunghe (1993) and Elkington (1997) defined

¹ University of Economics and Law, Vietnam National University Ho Chi Minh City.

sustainable development in three main focuses, which are economic, social, and environmental factors. Duran et al. (2014) shared the same view that sustainable development includes three main components of economic, ecological, and human factors. Meanwhile, Lan (2014) and Sauvart and Mann (2017) pointed out sustainable FDI includes five main dimensions, economy, social development, environmental management, institution quality and labor skills. In fact, there are studies on the impacts of FDI on individual aspects of sustainable development worldwide and in developing countries. According to Blomstrom & Kokko (1996), FDI enhances the productivity of economic growth locally. Nga and Huong (2017) conducted research about “green FDI”. They demonstrated that green FDI can promote sustainable economic growth. Ahmad et al. (2019) conducted a study on how FDI inflow can reduce the poverty rate in South Asian and Southeast Asian countries. Meanwhile, Nguyen and Trinh (2008) concluded that the FDI and international integration are the main cause of unequal income distribution in urban and rural areas of Vietnam. By contrast, Kaulihowa and Adjasi (2017) and Ucal et al. (2015) revealed an opposite finding on FDI and income inequality with Nguyen and Trinh (2018). The study showed that FDI can contribute to decrease the income inequality in Turkey and Africa. Meanwhile, Ngoc, Le, and Duy (2019) showed that FDI and human capital contribute to positive impacts on labor productivity in Vietnam, which implies that the labour force is encouraged to enrich their knowledge and skills and the government should plan in detailed to boost human capital. Furthermore, Bakhsh et al. (2017) and Sargunesi (2018) showed FDI could worsen CO2 emissions in Pakistan and Turkey respectively.

In terms of studies on the total point of view for all sustainable development factors and FDI, there are just few studies. Ridzuan et al. (2017) researched FDI and sustainable development in Singapore. The research showed that economic growth and environmental quality will be improved by FDI, but FDI worsens the income equality in this country. Robi and Shunsuke (2018) studied the relationship of economic growth and sustainable development in Indonesia. Tien et al. (2020) figured out that FDI and economic growth have a positive relationship in the middle of Vietnam. However, FDI corporations tend not to abide strictly to environmental law in this region. Overall, studies so far in developing countries have not been profoundly conducted in terms of combined pillars or dimensions of sustainable development and FDI. Specifically, the impacts of FDI on sustainable development of all social, environmental, and economic factors of a large number of developing nations have not been pointed out clearly and altogether. Moreover, most of studies are conducted in a single location or region. There has been little research of FDI and three pillars of sustainable development in many developing countries. Thus, this research is executed to fill these research gaps with an aim to figure out the relationship and impact of FDI on three main pillars of sustainable development in 32 developing countries and give recommendations to promote sustainable development in developing nations.

2. THEORETICAL FRAMEWORK

2.1. Foreign direct investment and economic growth

Dunning & Lundan (2008) showed that FDI contributes to economic development by building new companies, recruiting more workers, and reducing unemployment. Pegkas (2015) used two regression models of Full Modified Ordinary Least Square (FMOLS) and Dynamic Ordinary Least Square (DOLS) to investigate the impacts of FDI on economic growth of European countries from 2002 to 2012. The research also proposed a positive relationship between FDI and economic growth in these countries. Sunde (2016) researched how export and FDI inflows affect Africa’s economic growth from 1990 to 2014. By utilizing the Bound estimation, the author found out that FDI and export contribute to positive economic growth in

African countries. Ridzuan et al. (2017) showed that FDI contributes positively to the economic growth of Singapore through the autoregressive distributed lag estimation technique. Tien et al. (2020) conducted research on how FDI affects economic growth in terms of sustainable development in the middle of Vietnam. There are five main impacts examined, including economics, society, environment, institutions, and labour from surveying 194 FDI companies in the middle of Vietnam and using a Likert scale with 5 levels and the descriptive statistics method to analyze. The study shows FDI has positive impacts on economic growth. Overall, most of the existing studies of the relationship between FDI and economic growth are positive. Researchers showed that FDI contributes to the economic development for host nations.

2.2. Foreign direct investment and income distribution

Ridzuan et al. (2017) show that FDI brings negative effects on income equality in Singapore. There is also a research of Hyungsun and Miguel (2017) on the relationship of FDI and income distribution in 7 countries in Southeast Asian (Laos, Cambodia, Indonesia, Thailand, Philippines, Malaysia, and Vietnam). The authors used a sample period between 1990 to 2013. The result showed income equality decreases if FDI inflows increase. Anwar & Lan (2010) also pointed out that big cities in Vietnam tend to attract more FDI, thus creating unequal distribution of FDI among Vietnam through examining the two-way linkages of economic growth and FDI among provinces in Vietnam from 1996 to 2005. On the other hand, there are studies showing that FDI can reduce income inequality in the long run. Specifically, Figini and Gorg (2011) demonstrated that although increases in FDI would cause rises in income inequality, this effect can reduce if FDI continues to increase in developing nations. Ucal et al. (2015) also showed FDI can reduce the income inequality in Turkey with ARDL estimation technique. Kaulihowa and Adjasi (2017) also showed the same finding that FDI decreases income inequality in 16 African countries in the long run with higher economic growth. In addition, Quoc et al. (2021) conducted a study to clarify the impacts of FDI and income inequality in Vietnam using the Generalised Method of Moment model from 2012 to 2018. The research shows that FDI has a negative impact on income inequality. The expansion of FDI can increase income inequality and income inequality increases as the Vietnam economy develops. However, when human resources develop and economic governance improves, income inequality will improve. Overall, in terms of FDI and income distribution, there have been both positive and negative relationship.

2.3. Foreign direct investment and environmental quality

Mihaela (2014) studied the relationship between FDI and sustainable development in terms of the environment in 6 countries in Europe (Sweden, Slovakia, Poland, France, Spain, and Greece). The research showed that the hypothesis of pollution haven does not work and if FDI focuses on environmental sectors, it will have positive impacts on sustainable development. Huiming et al. (2016) figured out that FDI and CO₂ emissions have a negative relationship. It means that economic growth contributes to less CO₂ emissions in ASEAN-5. Similarly, Wu and Li (2011) revealed that increases in FDI do not mean that the level of pollution will rise in China. The authors claimed that FDI enterprises will bring advanced technologies and encourage transfers within the country towards better technologies, which in turn boosts production efficiency and reduces pollution. By contrast, Tien et al. (2020) stated that FDI harms the environment as FDI enterprises tend to bring old technology to the host countries and are careless about protecting the environment. Trinh and Quoc (2017) relied on the Leontief and Ghosh systems to calculate the greenhouses gas emissions when economic growth increases in Vietnam. The study showed the higher economic growth, the higher level of CO₂ emission. Overall, previous studies have showed both positive and negative impacts of FDI on CO₂ emissions in many countries worldwide.

3. RESEARCH METHOD

From previous research and analysis, the research relies on three main dependent variables with three main research models based on the research of FDI and three main pillars of sustainable development of Ridzuan et al. (2017) in Singapore. First is the model of economic growth with the dependent variable being real gross domestic product per capita (GDP) and other independent variables are foreign direct investment (FDI), the total labour force (LAB), gross fixed capital formation (DI), and trade openness (TO). Second, is the model of income distribution with Gini coefficient (GINI) as a dependent variable. GINI is the index to measure income distribution in the population invented by Corrado Gini. It can be measured by ranges from 0 to 1 or percentage. A higher number means a higher income distribution gap. Other independent variables are GDP, DI, FDI, and TO. Third, is the model of environmental quality. CO₂ is the main dependent variable and GDP, FDI, per capita energy consumption, kg of oil equivalent (EN), and TO are independent variables. All variables will be used under log-linear form (LN).

3.1. Model of economic growth

The production function framework of Cobb-Douglas is applied with three variables of capital, labour, and FDI as follow:

$$Y_t = f(K, L, FDI) \quad (1)$$

In which:

Y: real output

K: capital

L: labour

FDI: foreign direct investment inflows

This standard function then was extended further by Lucas (1988), Romer (1986), and Rebelo (1991) by adding the model of endogenous growth. This theory confirmed that both the amount of investment and the efficient use of investment affect the development of a country in the long run. Thus, this research is based on the equation of Ridzuan et al. (2017) to build a suitable equation from equation (1) and this equation is also logged as follow:

$$\text{LNGDP}_t = \beta_0 + \beta_1 \text{LNLAB}_t + \beta_2 \text{LNDI}_t + \beta_3 \text{LNFDI}_t + \beta_4 \text{LNTO}_t + \varepsilon_t \quad (2)$$

In which:

GDP: real gross domestic product per capita

LAB: total labour force

DI: gross fixed capital formation (domestic investment)

FDI: foreign direct investment inflows as a percentage of GDP

TO: the sum of export and import amount over GDP

According to Sahoo and Mathiyazhagan (2003) and Ridzuan et al. (2017), because FDI has a positive relationship with economic growth, it is added to the equation. Similarly, through previous research on the relationship between FDI and GDP, two variables also show a positive relationship (Dunnung and Lundan, 2008; Tien et al., 2020; Anwar & Lan, 2010; Pegkas, 2015; Sunde, 2017; and Vy, 2021). The control variable of LAB is also added to control GDP and avoid variable biases (Ridzuan, et al., 2017). In terms of DI which means domestic investment, it was invented by Barro in 1999 and had positive impacts on economic growth. Moreover, TO is a criterion to evaluate the trade openness for the economic growth of an economy. TO is considered to have a positive relationship with economic growth (Balasubramanyam et al., 1996).

3.2. Model of income distribution

The standard income distribution model was developed by Mah (2003):

$$GINI_t = f(Y_t, Y_t^2, FDI_t, TO_t) \quad (3)$$

In which:

GINI: Gini coefficient

Y & Y²: per capita income and per capita income square

Based on the research of Ridzuan et al. (2017), Y² will be removed not to violate the Kuznets Curve in the following equation:

$$LNGINI_t = \alpha_0 + \alpha_1 LNGDP_t + \alpha_2 LNDI_t + \alpha_3 LNFDI_t + \alpha_4 LNTO_t + \varepsilon_t \quad (4)$$

In which:

GINI: Gini coefficient

GDP is projected to have either negative or positive effects on income distribution (Ridzuan et al., 2017). Other variables also have both negative and positive effects on GINI. DI is considered as a positive effect on GINI (Mah, 2003). However, according to supporters of the neoclassical theory, GINI and DI have the opposite effect (Ridzuan et al., 2017). Moreover, on one hand, GINI and FDI are considered to have a negative relationship (Ridzuan et al., 2017; Anwar & Lan, 2010; Hyungsun and Miguel, 2017; Nguyen et al., 2020). On the other hand, Figini and Gorg (2011) and Quoc et al. (2021) expect positive impacts of FDI on GINI. In terms of TO, TO is predicted to have a positive relationship with GINI (Dependency Theory).

3.3. Model of environmental quality

The model of environmental quality is relied on the model by Shahbaz et al. (2013):

$$CO_{2t} = f(Y_t, F_t, E_t, TR_t) \quad (5)$$

In which:

CO₂: emissions metric ton per capita

Y_t: real GDP per capita

F_t: financial development

E_t: energy consumption per capita

TR_t: trade openness per capita

Based on the research of Ridzuan et al. (2017) of sustainable development in terms of environment and FDI in Singapore, the equation is adjusted in log as follow:

$$LNCO_{2t} = \varphi_0 + \varphi_1 LNGDP_t + \varphi_2 LNFDI_t + \varphi_3 LNE_t + \varphi_4 LNTO_t + \varepsilon_t \quad (6)$$

In which:

EN: per capita energy consumption, kg of oil equivalent

CO₂ emissions are considered a serious factor contributing to the greenhouse effect when more than 60% of greenhouse gas is from CO₂ emissions (Ozturk and Acaravci 2010). Moreover, according to Ridzuan et al. (2017), there have been hot debates surrounding the topic of CO₂ emissions and their impacts on the environment, global warming, sustainable energy and orientations toward sustainable development. Therefore, CO₂ emission is chosen to discuss and give a further evaluation to the research world. Overall, it is expected that CO₂ emissions and GDP have a positive relationship. FDI, on the one hand, has both negative and positive effects. If FDI enterprises bring green and modern technology to the host countries or focus on environmental factors, FDI and CO₂ will have negative relationship (Mihaela, 2014 and Ridzuan et al. 2017). By contrast, FDI and CO₂ will have positive effects if FDI companies do not focus on

environmentally friendly factors (Marian et al., 2016 and Tien et al., 2020). TO is also added to the equation as it may bring negative impacts on the environment (Antweiler et al., 2001). Finally, EN is also discussed in the equation to define its effects on environmental quality. It is forecasted to have a positive relationship with CO₂ (Ang, 2007; Hailiciouglu, 2009; Ridzual et al., 2017).

3.4. Research hypothesis

Based on previous research on the relationship among variables, there are hypothesis drawn for each model as follow:

- Economic growth model:

H1: Foreign direct investment is expected to have impacts on economic growth in developing countries.

- Income distribution model:

H2: Foreign direct investment is expected to have impacts on Gini coefficient in developing countries.

- Environmental quality model:

H3: Foreign direct investment is expected to have impacts on CO₂ emissions in developing countries.

3.5. Research data

There are 32 developing countries investigated in this research (Argentina, Bangladesh, Belarus, Brazil, Bulgaria, Chile, China, Colombia, Ecuador, Egypt, India, Indonesia, Iran, Jordan, Malaysia, Mexico, Morocco, Nepal, Nigeria, Oman, Pakistan, Peru, Philippines, Poland, Romania, Russia, South Africa, Sri Lanka, Thailand, Uruguay, Vietnam, and Zimbabwe). They are on the list of 152 developing countries provided by World Data based on the definition of IMF. The reasons why these developing countries are chosen are due to the availability and sufficiency of data sources. The time series is based from 1990 to 2019 to have a large panel enough for analysis. Data is extracted from the World Bank (2023), The World Development Indicator (2023), Vietnam General Statistics Office (2023), and the Global Consumption Income Project (2015).

4. RESULTS AND DISCUSSION

4.1. Results

Firstly, Stata 16.0 software is executed to describe basic information of all researched variables. **Table 4.1.1** below demonstrates mean, standard deviation, minimum, and maximum of variables. The lowest mean is detected from LNCO₂ variable of 0.7534 and the standard deviation is 1.0920, whereas the highest value of mean is LNDI, at 23.9405 with a standard deviation of 1.6425. Overall, the standard deviation among variables ranges from 0.1379 to 2.3761. Ranges are not big, even smaller than means. This means that there is not much difference in researched variables of all countries.

Table 4.1.1: Overall descriptive analysis of researched variables.

Variable	Mean	Standard. Deviation	Minimum	Maximum	Observations
LNGDP	7.8457	1.0896	4.5718	10.1155	960
LNCO ₂	0.7534	1.0920	-3.0382	2.8406	960
LNGINI	3.8209	0.1379	3.2268	4.0308	960
LNLAB	16.7089	1.4700	13.2390	20.4757	960
LNFDI	21.1397	2.3761	9.2103	26.3963	960
LNTO	4.0258	0.5216	2.6213	5.3955	960
LNEN	6.9505	0.8128	4.7443	8.8341	960
LNDI	23.9405	1.6425	18.5616	29.4418	960

Source: Stata 16.0 analysis

Secondly, five statistics tests to choose suitable regression models will be conducted. The first test is cross-sectional dependence which is made to choose a suitable test for stationarity. If the panel data is cross-sectional dependent, second-generation unit root test (CIPS) will be executed to test for stationarity. By contrast, if the panel data does not have cross-sectional dependence, stationarity tests such as Levin-Lin-Chu, Breitung, IPS or Fisher will be performed. For this section, cross-sectional dependence Pesaran test is executed. The null hypothesis is “There is no cross-sectional dependence”. All p-value of three models is less than 1% (see **Table 4.1.2** below). Thus, H0 is rejected. This mean that there is cross-sectional dependent test.

Table 4.1.2: Results of cross-sectional dependent test.

Cross-sectional dependence test		
H0: There is no cross-sectional dependence		
Models	p-value	Conclusion
Economic growth model	0.0000	cross-sectional dependence
Income distribution model	0.0058	cross-sectional dependence
Environmental quality model	0.0000	cross-sectional dependence

Source: Stata 16.0 analysis

Because there is cross-sectional dependence, the second test of CIPS for stationarity will be performed (see **Table 4.1.3** below). The null hypothesis for this test is “There is non-stationarity. The results show that variables stop at both I(0) and I(1). I(0) means at the level, while I(1) means at first difference. LNFDI, LNTO, and LNGINI stop at I(0), whereas LNGDP, LNLAB, LNDI, LNC02, and LNEN stop at I(1).

Table 4.1.3: Results of stationarity test.

CIPS stationarity test							
H0: There is non-stationarity.							
Models	Variables	Levels	Result	Variance	Levels	Results	Final results
Economic growth model	LNGDP	-1.494	NS	d.LNGDP	-4.570	S	I(1)

S: Stationarity							

Source: Stata 16.0 analysis

If independent variables are correlated, estimation might be biased. Thus, the third test for multicollinearity of variables is carried out. The regression models are run, then test correlation and VIF are also conducted. **Table 4.1.4**, **Table 4.1.5**, and **Table 4.1.6** show the correlation of variables in economic growth, income distribution, and environmental quality model.

Table 4.1.4: Correlation of variable in economic growth model.

Variables	LNGDP	LNLAB	LNDI	LNFDI	LNT0
LNGDP	1				
LNLAB	-0.2067	1			
LNDI	0.4234	0.7726	1		
LNFDI	0.5137	0.5331	0.8011	1	
LNT0	0.1794	-0.4157	-0.231	-0.0189	1

Source: Stata 16.0 analysis.

Table 4.1.5: Correlation of variables in income distribution model.

Variables	LNGINI	LNGDP	LNDI	LNFDI	LNT0
LNGINI	1				
LNGDP	-0.0984	1			
LNDI	-0.0207	0.4234	1		
LNFDI	0.0244	0.5137	0.8011	1	
LNT0	-0.3251	0.1794	-0.231	-0.0189	1

Source: Stata 16.0 analysis.

Table 4.1.6: Correlation of variables in environmental quality model.

Variables	LNC02	LNGDP	LNFDI	LNEN	LNT0
LNC02	1				
LNGDP	0.7326	1			
LNFDI	0.3819	0.5137	1		
LNEN	0.9326	0.7155	0.2857	1	
LNT0	0.354	0.1794	-0.019	0.3365	1

Source: Stata 16.0 analysis.

Overall, there is a high correlation among variables, such as LNFDI and LNDI at 80.11%, LNGDP and LNCO2 at 73.26% or LNEN and LNCO2 at 93.26%. Therefore, it is important to check multicollinearity (see **Table 4.1.7** below). Mean VIF of the three models is from 1.86 to 3.15. These numbers are not large enough to cause multicollinearity. Thus, there is no multicollinearity.

Table 4.1.7: Mean VIF of economic growth, income distribution, and environmental quality model.

Variable	VIF	1/VIF	Variable	VIF	1/VIF	Variable	VIF	1/VIF
LNDI	5.24	0.191	LNDI	3.25	0.307	LNGDP	2.61	0.383
LNFDI	3.09	0.323	LNFDI	3.25	0.308	LNEN	2.28	0.439
LNLAB	2.96	0.338	LNGDP	1.45	0.691	LNFDI	1.4	0.716
LNT0	1.3	0.768	LNT0	1.22	0.817	LNT0	1.15	0.871
Mean VIF	3.15		Mean VIF	2.29		Mean VIF	1.86	

Source: Stata 16.0 analysis.

The fourth test for autocorrelation of variables will be proceeded. The null hypothesis is “There is no first-order autocorrelation”. P-value of the three models is less than 1%, thus, H0 is rejected. Therefore, there is autocorrelation among variables (see **Table 4.1.8** below).

Table 4.1.8: Results of Wooldridge test for autocorrelation.

Wooldridge test for autocorrelation		
H0: There is no first order autocorrelation		
Models	p-value	Conclusion
Economic growth model	0.0004	autocorrelation
Income distribution model	0.0000	autocorrelation
Environmental quality model	0.0000	autocorrelation

Source: Stata 16.0 analysis.

Final test is Heteroscedasticity with the null hypothesis of “There is no heteroscedasticity”. P-value off three models is less than 1%, thus, there is heteroscedasticity (see **Table 4.1.9** below for the results).

Table 4.1.9: Results of heteroscedasticity test.

Likelihood-ratio test		
H0: There is no heteroscedasticity		
Models	p-value	Conclusion
Economic growth model	0.0000	heteroscedasticity
Income distribution model	0.0000	heteroscedasticity
Environmental quality model	0.0000	heteroscedasticity

Source: Stata 16.0 analysis.

After testing, the panel data has almost disturbances. Therefore, according to Daniel (2007), Generalized Least Squares (GLS) regression and Panel-Correlated Standard Error (PCSE) regression are the most suitable. GLS is used if observation variables are less than time series ($N < T$). And PCSE will be executed with a larger panel scale. In this research, there are 32 countries and 30 years investigated ($N > T$). Thus, PCSE is more suitable.

Based on the results (see **Table 4.1.10** below), in the economic growth model, all four variables of LNLAB, LNDI, LDFDI, and LNT0 are statistically significant as p-values are less than 5%. In terms of income distribution model, there is only LNDI variable not having statistical significance. In the model of environmental quality model, all variables are statistically significant as p-values are less than 5%. R-squares of three model are high. For the economic growth model, LNLAB, LNFEDI, LNDI, and LNT0 can explain 93.59% of the variation for LNGDP. The model showed that both LNFEDI and LNDI have positive relationship with LNGDP. By contrast, LNT0 shows the opposite impact on LNGDP. However, this is not the main variable, thus, it is not significant. Therefore, in this model, the main independent is LNFEDI and it has positive effects on economic growth. This aligns with the research’s hypothesis. In the model of income distribution, LNT0 and LNGDP have a negative relationship with LNGINI. By contrast, LNFEDI shows a positive relationship with LNGINI. This result is up to author’ expectation. Moreover, R-squares of this model is 0.9773. This means that independent variables of LNGDP, LNFEDI, and LNT0 can explain 97.73% of variation for LNGINI. In the model of environmental quality, all variables have a positive relationship with LNCO2. In which LNE0 has the strongest impact on LNCO2. Increases in LNFEDI and LNGDP also make LNCO2 increase. These results align with the research hypothesis. Furthermore, LNT0 affects LNCO2 positively, which is logical with the result of LNCO2 and LNFEDI. When FDI increases, it means TO also increases.

Table 4.1.10: Results of PCSE regression.

Economic growth model

5. DISCUSSION

From the research's result in the economic growth model, foreign direct investment (FDI) has positive impacts on GDP in developing countries. When the amount of FDI inflows increases, GDP per capita also increases. Specifically, if there is 1% increase in FDI inflows, GDP per capita will rise by 2.1%. This means that FDI will rise GDP per capita of developing countries. The result is suitable with previous research of Dunnung & Lundan (2008); Anwar & Lan (2010), Pegkas (2015); Sunde (2017); Ridzuan (2017); and Tien et al. (2020). In this model, however, LNFDI contributes a small proportion to economic growth in developing countries, whereas LNDI shows a considerable positive impact on LNGDP. As when domestic infrastructure is improved, it will create effectiveness and efficiency in production, transportation and distribution. It is implied that to promote economic growth, foreign investment one of contributors, but the main factor needs to come from the country itself to make more domestic investment to improve the infrastructure and facilities. As for LNT0 and LNLAB, they are considered to have negative relationship with LNGDP. Moreover, LNLAB has negative impacts on LNGDP. This can be explained that when the total labour increases, but there are no sufficient jobs in the economy for employees, the labour force market will become more competitive and there are more unemployed people. This affects the real gross domestic

products per capita. However, this not the main variable of this research, thus, further studies need to be carried out to have deeper insights.

In the income distribution model, LNFDI has shown the positive relationship with LNGINI. When LNFDI increases by 1%, LNGINI then increases by 0.38%. This result aligns with Ridzuan (2017), Anwar & Lan (2010), Hyungsun and Miguel (2017), and Nguyen et al. (2020). This means that when a developing country receive more FDI, the income inequality will rise at the same time. According to Lee and Vivarelli (2006), FDI enterprises or multinational corporations tend to seek high-skilled and quality labor force, thus boosting the income gaps among levels of labour. Moreover, Nguyen at el. (2020) explained that FDI tends to focus on big cities in urban areas instead of rural areas, thus, creating the income gap within a nation. However, Quoc et al. (2021) revealed if there are policies to develop human resources and distribute FDI reasonably, FDI will help to reduce income inequality. By contrast, LNGDP shows negative impacts on LNGINI. The higher GDP per capita, the lower Gini coefficient. In fact, incentives or increases in salary will create more motivation for the labour force to work harder, which increases GDP per capita and therefore, reducing the income inequality.

In the environmental quality model, all the independent variables are statistically significant and have positive relationship with LNCO2. These results similar with previous research of Antweiler et al., (2001); Ang, (2007); Hailiciouglu, (2009); Wu and Li (2011); Mihaela (2014); Huiming et al. (2016); Bakhsh et al. (2017); Ridzual et al., (2017); and Sargunesi, (2018). In which LNEN has the highest correlation values with LNGINI. This means that 1% increase in LNEN will create 111.19% increase in LNCO2. According to Ang, (2007) and Hailiciouglu, (2009), when the economy is growing, the energy consumption will also increase, thus adding more CO2 emissions. FDI and TO also worsen CO2 emissions when LNFDI and LNTO increase by 1%, LNCO2 will rise by 5.03% and 13.51% respectively. This means when a developing country is more open to imports and exports and FDI will increase, which causes increases in CO2 emissions. As many of FDI enterprises or multinational corporations invest in production or heavy industries in developing countries. Or they may bring old and out-of-date machines, equipment and technology and take advantage of legal gaps or lax regulations.

Overall, when combining all three pillars of sustainable development (economic growth, income distribution, and environmental quality) in 32 researched developing countries, it can be said that FDI promotes economic growth in these countries. However, there are also needs for other improvements such as domestic investment to attract more FDI and sustain a long-term growth. On the other hand, FDI causes increases in Gini coefficient and higher CO2 emissions in these developing countries. Therefore, from 1990 to 2019, FDI in 32 researched countries has not contributed to the comprehensive sustainable development due to its negative impacts on income distribution and the environment.

Table 4.1.11: Conclusions of research hypothesis.

Hypothesis	Conclusion
H1: Foreign direct investment is expected to have impacts on economic growth in developing countries.	Positive
H2: Foreign direct investment is expected to have impacts on Gini coefficient in developing countries	Positive
H3: Foreign direct investment is expected to have impacts on CO2 emissions in developing countries	Positive

There are needs to take action towards sustainable development in these countries. Firstly, in terms of economic growth, developing countries should continue to focus on attracting more FDI inflows through open economic policies and create favourable conditions to FDI projects. Moreover, it is vital to have strict policies on taxes and control well financial statement of these FDI enterprises to ensure long-term economic growth. Furthermore, domestic investment should be focused on to enhance the infrastructure and facility

capability for the development to have competitive advantage in attracting FDI. This can be developments of road structure, bridges, subways, distribution warehouses, and industrial zone scales. Secondly, in terms of income distribution, the government should have policies to distribute FDI capital evenly across all the regions. This creates more equal job opportunities for all employees to approach and work for multinational companies. Moreover, educational programs should be executed to enhance the workforce capability and productivity. In addition, if the governments tend to promote economic development in remote areas, it is necessary to promote education and technology skills in these regions for the local. This does not only help to distribute foreign investment widely and to narrow the income gap, but this also promotes economic growth at the same time. Thirdly, in terms of environmental quality, the governments should investigate and evaluate the effectiveness of exiting FDI enterprises. The authorities should check operating processes, industrial disposal treatment, and business products of these enterprises carefully to make sure that all of them are safe and meet up with the standard requirements. Moreover, it is also important to fix and adjust stricter rules regarding industrial wastes and policies to protect the environment. Strict measures should be applied for those who violate the rules. Furthermore, for new FDI projects, the governments should prioritize and make favourable conditions for green FDI such as investments in advanced and modern technology, equipment and infrastructure which are environmentally friendly. It is also necessary to put limitation on mining or heavy industries which cause serious effects on the environment. Moreover, raising people's awareness about environmental problems is also urgent. When they are aware of problems such as climate changes, plastic waste, CO₂ emissions, greenhouse effects, they will consume wisely and choose sustainable-material products.

Besides positive contributions to the topic of FDI and sustainable development, this research still poses some limitations. Firstly, the paper uses secondary data from website which are publicised by individual countries. Thus, author could not fill in missing data blanks. Secondly, this research ignores the impact of recent events which have caused serious consequences in terms of economic, environmental, and social factors. The time series is from 1990 to 2019, which remove 2020, 2021, and 2022. These three years witnessed significant changes and serious damages of Covid-19 pandemic, Ukraine-Russia war, Suez channel blocking. Thus, the reseach fails to analyse and provide deeper insights of how these disruptions affect FDI and sustainable development. This will be a recommendation for further research to investigate in these factors.

6. CONCLUSION

Impacts of FDI and three pillars of sustainable development (economic growth, income distribution, and environmental quality) are examined in this research through data collected from 32 developing countries from 1990 to 2019. The results demonstrate that FDI inflows contribute to economic growth of developing countries. However, it is FDI inflows which cause environmental and social problems. They are increasing in income distribution gaps and CO₂ emissions disposed. Thus, it can be concluded that FDI inflows do not promote sustainable development in developing countries on the total point of view. Besides FDI inflows, the findings also show that not only FDI can contribute sustainable development path of developing country, but also domestic investments on infrastructure and facilities bring positive impacts on economic growth. Moreover, energy consumption per capita is considered a culprit of CO₂ emission rises. Therefore, it is imperative for governments in developing countries to execute policies which help to promote sustainable development. One of them is investing in domestic structure, combined with improving educational levels among their citizens, and launching campaigns to raise people's awareness of environmental problems. When domestic infrastructure is improved and education levels are upgraded for

most of citizens, countries can attract more FDI inflows and have equal income distribution. Furthermore, when people are well-educated in general levels and in terms of environment as well, they become more aware and have smart choice of consumption. For example, they might opt for green and sustainable products. Thus, this encourages both domestic and FDI enterprises change products to adapt to customers' demands. All of these, in the end, will lead to comprehensive sustainable development.

IMPACTS OF ECONOMIC GROWTH, FOREIGN DIRECT INVESTMENT AND RENEWAL ENERGY ON AIR POLLUTION: EMPIRICAL STUDIES IN SOME EAST ASIAN COUNTRIES

Authors: Trinh Trong Quyen¹, Nguyen Nhu Quynh¹, Le Thi Bang Nhan¹

Mentor: Dr. Ngo Ngan Ha¹

ABSTRACT: *This study uses FE (fixed effect method) and RE (random effect method) methods and applies panel data to analyze the impact of economic growth, foreign direct investment, and renewable energy on air pollution in East Asia in the period 2000 - 2021. In order to choose the best estimation method for the gravity model (expanding the study of Hausman & Taylor, 1981), the authors also inherit and use the Hausman-Taylor test to analyze and evaluate the results of the research model. Empirical research results show that economic growth and renewable energy have an impact on increasing air pollution. Meanwhile, foreign direct investment has the effect of reducing CO2 emissions in these countries. Based on the research results, the study proposes some policy implications to reduce air pollution in East Asian countries.*

Keywords: *Economic growth, foreign direct investment, renewable energy, environmental pollution, East Asia*

1. INTRODUCTION

Air pollution is one of the most challenging environmental problems facing countries. Air pollution levels remain dangerously high in many parts of the world. New data from the World Health Organization (WHO) shows that nearly the entire world population (99%) breathes air containing high levels of pollutants. According to the World Health Organization (WHO), there are 7 million premature deaths from exposure to air pollution globally each year.

East Asia is one of the regions with high economic growth and has become the most dynamic and innovative development region in the world. However, the downside of rapid economic growth is that these countries are facing air pollution problems. Facing this situation, along with many countries in the world, East Asian countries have joined the Glasgow Climate Agreement (COP26) with a commitment to reduce CO2 emissions by 45% by 2030 compared to 2010 levels and to zero by 2050. To achieve the above goal, countries in East Asia have developed action plans to realize the goals of COP26. However, on the way to that goal, countries in East Asia face the paradox that economic growth in most of these countries is based on fossil energy, causing air pollution. As well as attracting foreign direct investment capital has contributed greatly to economic growth and development, but in some countries, this region is putting pressure on the air environment. Experts have recognized that it is necessary to exploit renewable energy sources to reduce pressure on the atmosphere. Understanding the relationship between economic growth, foreign direct investment, renewable energy, and air pollution will help countries in East Asia develop the most appropriate policies to accomplish their target of COP26. Stemming from the above meaning, the study of the topic: “Impact of economic growth, foreign direct investment and renewable energy on air pollution: Empirical studies in some East Asian countries” is necessary.

2. THEORETICAL FRAMEWORK

2.1. Overview of air pollution

2.1.1. The concept of air pollution

Environmental pollution is a concept defined by many scientific disciplines. From a biological perspective, this concept refers to the state of the environment in which its chemical and physical parameters are changed for the worse. From an economic perspective, environmental pollution is an unfavorable change to the living environment in terms of physical, chemical, and biological properties that can cause immediate or long-term harm to the health of humans, animals, plants, and other living conditions.

In Vietnam, from a legal perspective: “Environmental pollution is the change of environmental components that do not conform to environmental technical regulations and environmental standards, causing adverse effects on humans and living organisms” (Clause 8, Article 3 of the Law on Environmental Protection 2014).

It can be seen that the most common of the above definitions of environmental pollution is the change of environmental components in a bad direction, which is detrimental to humans and organisms.

The atmosphere is the collection of all the gases that surround us. Air is responsible for providing life for all living things on earth, including humans. That is very important for the survival and development of all living things on Earth. Air pollution is a large change in the composition of the air due to the presence of foreign substances leading to unclean air or causing unpleasant odors, and reduced vision when looking at a distance. The state of air pollution is a topical issue of most concern worldwide.

2.1.2. Causes of air pollution

UNEP (2022) has pointed out some causes of air pollution as follows:

- *Natural causes*

- Air pollution from volcanic eruptions: Volcanic eruptions bring a large amount of nutrients to the soil. However, large amounts of methane, chlorine, and sulfur gas generated during volcanic eruptions cause serious air pollution.

- Wildfires: These fires will produce a huge amount of Nitrogen Oxide. Moreover, forest fires also release a large amount of smoke and ash into the air.

- Wind is an indirect cause of pollution: Not a direct cause, but the wind is also an indirect cause of air pollution. The wind is the vehicle that carries dust, and harmful gases from factories, natural disasters, etc. far and wide. This causes the pollution to spread rapidly.

- Air pollution from storms: Storms will produce large amounts of CO_x and fine dust, which increases the pollution in the air.

In addition to the above causes, the decomposition of animal carcasses, ocean waves, or natural radiation are also causes of air pollution.

- *Caused by human activities*

Humans are the victims of environmental pollution, but humans are also the main agents of environmental pollution. Many daily human activities contribute to air pollution.

- Industrial and agricultural production activities

This is the main cause, causing pain for the community and the state, not only in Vietnam but also in many developing countries. Smoke and dust from the exhaust pipes of factories and factories in industrial

zones darkened the sky. They emit CO₂, CO, SO₂, Nox, and some other organic substances, with extremely high concentrations. These industrial zones not only pollute the air environment but also pollute the water environment, causing “cancer villages” to be formed. Acid rain is also the result of industrial production activities that do not treat waste properly. The abuse of pesticides, fertilizers, or activities of burning straw, stubble, burning forests for farming are also causes of air pollution.

- Transportation

This is the biggest cause of air pollution today. With a huge number of vehicles constantly moving, the emissions from these vehicles are also terrible. Especially, for old cars, and poor mechanical systems, the higher the emissions. Vehicles release toxic substances into the air such as CO, VOC, NO₂, SO₂,... with extremely high and continuous concentrations. This cause is second only to industrial activities when the amount of emissions from vehicles discharged into the environment is very large.

- Infrastructure construction activities

Construction activities of high-rise buildings, high-rise apartments, or bridges always bring heavy air pollution. When transporting materials, even if carefully covered, dust will be scattered into the environment and cause pollution. Not to mention, in cases where it is not covered, materials will be dropped onto the road, causing danger and producing a huge amount of smoke and dust that can hinder vehicles traveling together on the road.

Besides, there are many reasons such as garbage collection, daily activities of people, defense activities, etc.

2.1.3. Effects of air pollution

Air pollution causes great harm to the natural world, the economy and to people. UNEP (2022) pointed out the following basic harms:

- Effects of air pollution on animals and plants

Air pollution causes great harm to animals and plants. Hazardous compounds (SO₂, NO₂, CO, H₂S, lead, etc.) can cause airway obstruction in animals. Accordingly, it reduces the immune system as well as the metabolism. Fruit trees are often very sensitive to changes in the environment. Fruit trees exposed to HF compounds can cause mass defoliation.

Hazardous chemicals present in polluted air can cause acid rain. Acid rain has the ability to kill beneficial microorganisms in the soil and destroy crops. Acid rain also changes the quality of water in rivers, streams, and lakes. Chemical compounds are also capable of combining with water present in the air. At the same time, following the rain, these compounds also seep into the ground, causing irreversible harm. This can cause mass death of animals and plants. Toxic chemicals also have the ability to seep into the food chain causing poisoning, polluting the water environment, and harming aquatic organisms.

- Harm to humans

Effects on human health are the most serious consequences of air pollution. It makes the rate of people suffering from respiratory diseases, cancer, and infertility, ... increasing. With the current era of industrialization, rapid development makes the need to use means and tools to simplify people's lives more and more. This has been causing an increase in the rate of smog in the air. Every day, people have to inhale a huge amount of dust pollution. Causes negative effects on the lungs, respiratory tract, and eye diseases. It also causes skin diseases, hair loss, baldness, etc.

- Consequences of air pollution on the economy and society

Air pollution causes many negative economic and social impacts. The physical and chemical factors of the environment are changed. The economy also suffers more damage when it comes to spending capital

to improve the living environment for people. In addition, when the environment is polluted, it will also have a direct impact on human tourism and shopping activities.

2.2. The relationship between economic growth, foreign direct investment, renewable energy, and air pollution

• The relationship between economic growth and air pollution

Most of the studies on the relationship between economic growth and environmental pollution in general and air pollution in particular aim to test the appropriateness of the environmental Kuznets Curve (EKC). The EKC hypothesis posits that the relationship between economic growth and environmental degradation is characterized by an inverted U-shaped curve. Accordingly, economic growth is not a threat, but a means to improve the environment in the future. Specifically, environmental pollution increases in the early stages of economic development, but after a certain income milestone, environmental quality improves and the level of waste decreases. In the process of development, economic growth spurs an increase in demand for a clean environment to achieve a higher standard of living. At this stage, the processes of clean production, clean consumption, and the use of environmentally friendly products are given priority.

The impact of economic growth on air pollution is studied through the impact of economic growth on CO₂ emissions. The empirical study of Ahmed, K., Rehman, M., & Ilgan, O. (2017). shows that urbanization increases CO₂ emissions but to a certain extent, then this increase will reduce emissions in Indonesia during 1971 - 2014. Qichang, X., Junxian, L. (2019) found that the nonlinear effect of economic growth on CO₂ emissions follows an inverted U-shaped pattern, CO₂ emissions tend to increase in the early stages of economic expansion and then decrease as China's economy grows. An empirical study by Tran, T.M., et al (2022) using the VAR model and variance decomposition to test the impact between CO₂ emissions, foreign direct investment, and economic growth in Vietnam shows a positive relationship between CO₂ emissions and economic growth with an impact rate of 17.4%. However, this study only tests the one-way causal relationship from GHG emissions to economic growth. The empirical study of Soytaş, U., Sari, R., & Ewing, B. T. (2007) suggests that in the long run, growth increases pollution in the United States from 1960 - 2004. At the same time, the empirical finding of Salahuddin et al (2015) shows that growth stimulates CO₂ emissions in the member countries of the Gulf Cooperation Council during the period 1980 - 2012. Meanwhile, Ahmed et al. (2017) concluded that income has a negative impact on environmental degradation in five South Asian countries for the period 1971 - 2013.

• The relationship between foreign direct investment and air pollution

Theoretically, the impact of FDI on the environment can be positive or negative. According to the argument of the “pollution hiding place” hypothesis raised and developed by Brian, C., & Taylor, S (1994), negative effects occur when FDI inflows increase emissions to the environment. Similarly, Golub et al. (2011) argue that liberalization without policies and measures to protect the environment will gradually become a competitive tool among developed countries to attract FDI. Many empirical studies also provide evidence that FDI enterprises significantly increase CO₂ and SO₂ emissions in China (Cole et al., 2011), Turkey (Kihcarslan and Dumrul, 2017); a 1% increase in FDI inflows increases pollution by 0.04% in Latin American countries (Sapkota and Bastola, 2017); in both the short and long term, an increase in FDI has the effect of increasing CO₂ emissions, and conversely, an increase in CO₂ also has an effect of increasing FDI wages (Tran, T.M, 2022).

In contrast, some scholars support the “pollution halo hypothesis”, the impact of FDI on the environment can also be positive. FDI enterprises are usually developed corporations in the world, production processes, application of advanced technologies, new, cleaner, and energy-saving technologies. Therefore, the harmful

environmental impact of FDI enterprises does not last forever (Asghari, M., 2013). The empirical study of Ngonadi et al. (2020) also shows that FDI inflows reduce CO₂ emissions in sub-Saharan Africa in the period 2004 - 2015 by means of generalized moment regression. Research by Tang and Tan (2015) also supports this hypothesis by showing that increased FDI contributes to a decrease in CO₂ emissions.

- *The relationship between renewable energy and air pollution*

Energy is considered the lifeblood of the economy, and the most important tool for the socioeconomic development of a country (Sahir, H., & Qureshi, H., 2007). Energy can be classified into fossil energy and renewable energy. In particular, some energy sources such as fossil fuels and coal pollute the environment while renewable energy helps clean the environment (Bennett and Zaleski, 2001). Agreeing with Leonard, B., & Pierre, Z., (2001), Bekun et al. (2019) also argue that renewable energy consumption can help improve environmental quality, and fossil fuels can lead to the decline of a country's environmental portfolio. However, Bilgili et al. (2016) with panel data of 17 OECD countries for the period 1977-2010, through the FMOLS, DOLS method, concluded that renewable energy consumption has a negative impact on CO₂ emissions. Thus, the research literature on the relationship between renewable energy and CO₂ emissions shows rather conflicting results.

3. RESEARCH METHODS

3.1. Research methods and models

In order to understand the impact of economic growth, foreign direct investment, and renewable energy on air pollution in some East Asian countries, it is possible to apply the pooled estimation method – the POOLED method, the fixed effect method (FE) and the random effect method (Random Effect – RE). The POOLED method helps to increase the number of observations but ignores the differences between the research subjects. In practice, this has certain limitations when applied to analyzing the effects of economic growth, foreign direct investment, renewable energy, and environmental pollution in some East Asian countries by countries in the region. These countries have differences in per capita income, foreign direct investment attracts, etc. To overcome this drawback, the authors use FE and RE methods. In order to choose the best estimation method for the gravity model (expanding the study of Hausman & Taylor, 1981), the Hausman-Taylor test method has been developed, which is the most suitable method to compare and choose between FE and RE methods (Egger, 2005). In this study, the authors also inherit and use the Hausman-Taylor test to analyze and evaluate the results of the research model.

To analyze the impact of economic growth, foreign direct investment, and renewable energy on air pollution in some East Asian countries, with the help of STATA 15, the proposed regression model for the study is as follows:

$$CO2_{it} = \beta_0 + \beta_1 \cdot GDP_{it} + \beta_2 \cdot FDI_{it} + \beta_3 \cdot RENEW_{it} + \epsilon_{it}$$

Where “i” is representative of the countries studied in the panel data, $i = 1 \dots 9$; t is the study period, $t=2000 \dots 2021$. At the same time, to “smooth” the research data, the variables GDP, FDI, and RENEW are taken logarithmically. From the results of the above model estimation, to evaluate the received model, the study uses the following tests: Wooldridge autocorrelation test, and Wald test of variable variance.

3.2. Research data

The data used in the study were compiled from the databases of the websites: The World Bank Development Indicators Database (<https://data.worldbank.org/>) and Our World in Data (<https://ourworldindata.org/>) on factors affecting air pollution in some countries in East Asia in the period 2000 - 2021.

Table 1. Variables used in the research model

Variables	Describe	Source
CO2	CO2 emissions per capita	Our World in Data
GDP	Gross domestic product per capita	The World Bank Development Indicators Database
FDI	Foreign direct investment capital	The World Bank Development Indicators Database
RENEW	Renewable energy (% primary energy)	Our World in Data

Source: Authors' synthesis

4. RESULTS AND DISCUSSION

4.1. Situation of air pollution in East Asia

There are different views when considering the concept of East Asia. According to common understanding, from a geographical or ethnic perspective, East Asia (or Greater East Asia, Far East) is a concept to refer to a sub-region located in the East of Asia. In this geographical and geopolitical perspective, the region includes the countries and territories of China, Japan, Korea, Hong Kong, Macau, Mongolia, North Korea, and Taiwan.

The concept of East Asia including Southeast Asia and Northeast Asia is a widely used understanding today. East Asia is seen as a product of regional integration, an extension of the concept of East Asia in the usual sense but plus Southeast Asia. This interpretation comes from an initiative of Malaysian Prime Minister Mahathir Mohamad. He was the first person to officially promote the concept of East Asia including the member countries of ASEAN and Northeast Asia. The Chiang Mai Initiative (1997) was the result of a currency swap agreement by 13 countries to prevent further crises in the future. On that premise, economic relations have been increasingly consolidated through a series of Ministerial Meetings, Summits... With these developments, ASEAN+3 cooperation has been called East Asia more often and clustered. from East Asia is also understood in a broader sense

ASEAN+3 is considered one of the most important and fast-growing, dynamic economic regions in the world, but at the same time, it is also assessed by experts and scientists as an area with an alarming level of air pollution. China is now one of the world's largest CO2 emitters, accounting for 27% of all greenhouse gas emissions worldwide.

Table 2. CO2 emissions per capita of some countries in East Asia in the period 2015 – 2021

Unit: tons

Country	2015	2016	2017	2018	2019	2020	2021

Source: Our World in Data

Air pollution has had serious consequences in East Asian countries. In Indonesia, it is recorded that every year in this country, 123,753 people die from air pollution, about 60,040 people die from water

pollution, and 32,850 people die from exposure to emissions. This is due to many different reasons, but one of them is the deforestation rate of 40% in the past 50 years. In China, with the largest population in the world, along with many business and manufacturing activities, the country has to live in a state of extremely toxic fine dust, with extremely high CO2 content.

In the face of alarms about CO2 emissions and disasters caused by extreme weather, countries in East Asia have all made efforts to reduce CO2 emissions, but the results are different from country to country. The past years, although still at a high level, have seen encouraging progress in the direction and speed of CO2 reduction in China, Korea, Malaysia, and Thailand. Some of the economies that have not experienced consistent performance and lag in carbon emissions reductions over the past decade are Indonesia and Japan. Meanwhile, some economies such as the Philippines and Vietnam are coal-dependent developed countries and are still far from the destination of reducing CO2 emissions.

Recognizing the alarming levels of serious air pollution, countries in East Asia have joined the Glasgow Climate Treaty (COP26). COP26 has resulted in rapid and significant reductions in CO2 emissions, including a 45% reduction in CO2 emissions by 2030 from 2010 levels and to zero by mid-century, “taking into account different national circumstances.” However, what factors need to be adjusted to achieve the above goal requires careful study by countries.

4.2. Results of empirical research on the impact of economic growth, foreign direct investment, renewable energy, and environmental pollution in some countries in East Asia

4.2.1. Descriptive statistics

Table 3. Descriptive statistics of quantitative variables

Variable	Obs	Mean	Std. dev.	Min	Max
CO2	198	5.727131	3.813936	.6658252	12.96844
LOGGDP	198	3.835885	.5806941	2.596139	4.862096
LOGFDI	198	.7632582	.26796	-.6151807	1.514421
LOGRENEW	198	.595302	.5660603	-.7531611	1.383965

Source: Analytical results of the author's team

Table 3 presents statistical results describing the mean, standard deviation, minimum and maximum values of the variables used in the study. From the results of descriptive statistics, it is shown that the variables in the estimated model all collect enough data with 198 observations. The highest CO2 emissions were in Korea (in 2018) and the lowest in Vietnam (in 2000). Meanwhile, gross domestic product per capita GDP is highest in Singapore (in 2021) and lowest in Vietnam (in 2000). For foreign direct investment, FDI was highest in Singapore (in 2019) and lowest in Indonesia (in 2000). Finally, renewable energy consumption is the highest in Vietnam (in 2017) and the lowest in Singapore (in 2000).

4.2.2. Determine correlation coefficient and test for multicollinearity

The study conducted correlation analysis by making a matrix of correlation coefficients of the variables, presented in Table 4, showing that the Pearson correlation coefficient between pairs of variables ranges from 0.0627 to 0.8617. Which, the variables LOGGDP and LOGFDI have a positive effect on CO2 and LOGRENEW has a negative effect on CO2. Besides, the low correlation coefficient between the pairs of independent variables also contributes to further confirming the fit when multicollinearity will be less likely in the research model. Thus, the results of the above correlation analysis are consistent with most previous studies in the world and in line with the author's expectations during this research period.

Table 4. Correlation coefficients between variables

	CO2	LOGGDP	LOGFDI	LOGRENEW
CO2	1.0000			
LOGGDP	0.8617	1.0000		
LOGFDI	0.0627	0.2093	1.0000	
LOGRENEW	-0.5856	-0.6050	-0.4633	1.0000

Source: Analytical results of the author's team

Table 5. Multicollinearity Test

Variable	VIF	1/VIF
LOGRENEW	1.94	0.515422
LOGGDP	1.59	0.627507
LOGFDI	1.29	0.777446
Mean VIF	1.61	

Source: Analytical results of the author's team

Multicollinearity is a phenomenon in which the independent variables in the model are linearly correlated with each other. The study was conducted to test the hypothesis that there is no multicollinearity phenomenon by using the VIF criterion with the results presented in Table 5 showing that the VIF of all independent variables is less than 2, so the model does not have multicollinearity.

4.2.3. Analysis of regression results

Table 6. Model estimation results

CO2	FEM (1)	REM (2)
LOGGDP	1.962001*** (5.432152)	2.589748*** (7.628461)
LOGFDI	-1.795683*** (-3.205220)	-1.978631*** (-3.480478)
LOGRENEW	0.971858* (1.968775)	0.076333 (0.169535)
_Cons	-1.007 (-0.80)	-2.742** (-1.99)
Hausman Test	Chi2 (3) = 18.31 Prob > chi2 = 0.0004	
Modified Wald test	Chi2 (9) = 4043.61 Prob > chi2 = 0.0000	
Wooldridge Test	F(1, 8) = 0.085 Prob > F = 0.7787	

Note: *, **, *** show statistical significance at 10%, 5%, and 1%, respectively, and t statistics in parentheses

Source: Analytical results of the author's team

Next, the study applies regression methods on panel data, including the Fixed effects model (FEM) and Random effects model (REM). The results show that the Fixed effects model (FEM) regression method is more suitable due to the Hausman test with $\text{Prob} > \text{chi}^2 = 0.0004 < 0.05$. Wald test on the phenomenon of variance in the model shows that $\text{Prob} > \text{chi}^2 = 0.0000 < 0.05$, so we conclude that the model does not have variable variance. Wooldridge test shows that the model also does not have autocorrelation because $\text{Prob} > F = 0.7787 > 0.05$. After estimating the model by the FEM method and verifying that the model has no defects, we obtain the results of the research model:

$$\text{CO2} = -1.007 + 1.962 * \text{LOGGDP} - 1.796 * \text{LOGFDI} + 0.972 * \text{LOGRENEW}$$

With the dependent variable being CO2 emissions, after using the FEM method, we obtain the following research results:

First, economic growth has a positive impact on CO2 emissions. The results show that, in the absence of other factors, increased economic growth will increase CO2 emissions into the environment. This result is consistent with the study of Soytaş, U., Sari, R., & Ewing, B. T. (2007) and Salahuddin, M., Gow, J., & Ilgan, O. (2015). This is explained by the fact that in the past time, in order to achieve the goal of rapid economic growth in a short time, countries in the East Asia region have used outdated technologies in production as well as used a lot of fossil energy in the production process and caused air pollution.

Second, foreign direct investment has a negative impact on CO2 emissions. The results show that holding other factors constant, increasing foreign direct investment will reduce CO2 emissions into the environment. This is consistent with the empirical research of Asghari (2013), Ngonadi et al (2020), and Tang, C., Tan, B. (2015). In recent years, the Governments of East Asian countries have made adjustments in policies to attract foreign direct investment. These countries have switched from attracting width to attracting in-depth, prioritizing FDI flows with high science and technology content. That has contributed to improving the production process of enterprises and reducing CO2 in the environment.

Third, renewable energy has a positive impact on CO2 emissions. The results show that holding all other factors constant, an increase in renewable energy consumption will increase CO2 emissions into the environment. This result is consistent with the study of Bilgili et al (2016). In fact, in recent times, East Asian countries have developed renewable energy and used renewable energy in production. However, the development of renewable energy also affects the air environment. Building and assembling wind turbines, for example, requires hundreds of tons of materials – steel, concrete, fiberglass, copper, as well as neodymium and dysprosium used in permanent magnets. All of this activity releases carbon emissions.

4.4. Policy implications

From the above research results, the study proposes a number of policy implications to reduce environmental pollution as follows:

First, efforts to implement green growth goals. Economic growth has a great impact on environmental pollution. To reduce environmental pollution, green growth is a solution that many countries around the world are aiming for. East Asian countries need to move towards green growth through greening industrial production, developing a circular economy in agriculture; implement green consumption and green lifestyle. In which, the government completed the financial policy framework for green growth. Develop a policy framework for national budget allocation and management for the implementation of the Green Growth Strategy. In addition, completing the financial policy framework (including: Taxes, fees, subsidies, funds, sanctions, green criteria, sustainable development for listed companies on the stock exchange) promote the implementation of the Green Growth Strategy; Develop a mechanism to support the private sector in the preparation and implementation of green growth projects.

Second, continue to attract green FDI. East Asian countries need to continue to maintain the policy of attracting FDI in-depth. In particular, implementing preferential policies for investors using advanced production technologies to minimize environmental pollution in the production process. At the same time, to ensure the reduction of environmental pollution in industrial parks and export processing zones, the Government should strengthen the inspection and supervision of waste treatment in these areas. In particular,

the Government needs to develop and promulgate criteria, standards and regulations on exploitation and use of natural resources and environmental protection in attracting and using FDI. Environmental requirements and environmental impact assessments should be given top priority. Upgrading environmental standards to serve as a basis for not accepting projects that do not encourage investment (such as textile dyeing using old technology...). Always ensure the principle of not attracting FDI at all costs; not attract projects that have the risk of destroying natural resources and the environment

Third, develop renewable energy rationally. The important role of renewable energy development to replace fossil energy in production cannot be denied because renewable energy is effective in reducing environmental pollution. However, in the process of developing renewable energy, it is necessary to ensure that the construction and implementation of renewable energy projects and works do not affect CO₂ emissions into the environment. To develop renewable energy, Vietnam needs to apply appropriate mechanisms and policies such as: (i) Apply economic and financial incentives and support policies to promote the development and use renewable energy to solve the problem of shortage of primary energy sources and supply energy to rural areas; (ii) Establish a mechanism and use market measures to attract capital from all economic sectors to develop renewable energy, and at the same time contribute to improving the technical level of renewable energy technology, promote the development of the renewable energy equipment manufacturing industry, constantly improve competitiveness, move towards the renewable energy industry, under the support through government policies, soon achieve large scale for development.

5. CONCLUSION

Air pollution is a top concern of countries in the world in general and countries in East Asia in particular because of the harm it brings to the biological world, people, and economic development in countries. Therefore, understanding the factors affecting air pollution in East Asian countries to propose appropriate solutions for these countries. The research quantifies the impact of economic growth, foreign direct investment, and renewable energy on air pollution. Research results show that economic growth and renewable energy have a positive impact on air pollution; foreign direct investment has a negative impact on air pollution. From the above results, the study has proposed three groups of solutions. However, in order to implement the above solutions, efforts of the Government, businesses, and people are required.

Although the study has achieved certain results, the scope only considers the factors of economic growth, foreign direct investment, and renewable energy affecting air pollution, not other factors such as urbanization level, institutional environment, etc. Besides, another limitation of the study is the number of observations of the model. It can be seen that, for panel data, the number of observations of 09 countries is not an ideal number of observations. Therefore, the next development direction is to analyze more factors affecting air pollution and add the number of research countries.

ANALYZING THE IMPACT OF CLIMATE CHANGE FACTORS ON VIETNAM FRESH FRUIT EXPORT

Authors: Tran Hanh Quyen¹, Vu Thi Hoa Mai¹, Tran Thanh Thao¹, Pham Thi Lan Anh¹

Mentor: Doan Nguyen Minh¹

Abstract: Despite being highly important, fresh fruit export in Vietnam is exceptionally sensitive to climate related changes and can be negatively influenced by altered environmental factors. This study analyzes the impact of climate changes on Vietnam's fresh fruit export using Auto-regression distributed lag (ARDL) estimator. The results support a negative relationship between elevated temperature and fresh fruit export in both long and short run, while higher CO₂ and precipitation level is associated with larger export volume in the short-run, but show no significant influence in the long run. A set of recommendations is also drawn out based on the regression results

Keywords: Climate change, Fresh fruit export, ARDL estimation, Vietnam

1. INTRODUCTION

Fresh fruit production and export is a vital sector for Vietnam's agriculture industry, with diverse fruits grown in all regions thanks to favorable natural conditions. Vietnam currently exports fruits to over 40 markets, with China being the largest partner, followed by the US, EU, and South Korea. The export of key fruits, including mango, rambutan, coconut, dragon fruit, and pomelo, is showing strong growth, and Vietnam is expanding its export market to countries in Asia, Europe, America, and Africa. (Journal of Science and Technology in Forestry and Agriculture, October 2017).

Natural conditions such as soil, climate, rainfall, and water sources greatly affect the growth and development of crops, impacting productivity, quality, and export supply. Favorable conditions lead to high yields, while unfavorable conditions have negative effects. (Journal of Science and Technology in Forestry and Agriculture, October 2017).

The relationship between climate and trade has long been considered based on the relationship of trade activities that influence the increase or decrease of greenhouse gas emissions as well as the impact of increasing/reducing greenhouse gases on trade activities. Vietnam ranks high in vulnerability to the impacts of climate change and has been selected by the United Nations as a country to conduct typical research on climate change and human development (Vu Huy Hung, 2021).

The impact of climate change on Vietnam's trade will be most evident in sectors such as agricultural exports in general or fresh fruit exports in particular which are highly sensitive to climate change. Export turnover of these industries is at risk of decline due to decreased production volume and tightening regulations on emission standards. (Vu Huy Hung, 2021)

Research dedicated to evaluating the impact of climate change on fresh fruit export in specific country contexts is abundant. However, the differences in estimation methods and data collection often lead to results' heterogeneity. The main objective of this study is to utilize a holistic estimation method based on the ARDL model to assess the relationship between climate change and fresh fruit exports in Vietnam in both the short term and long term. The estimation results then act as a basis for recommendations aiming at harmonizing the relationship between climate change and fresh fruit exports in Vietnam.

2. LITERATURE REVIEW

Environmental pollution and the effects of climate change have caused quite a bit of concern in recent decades, and a lot of research has been conducted to identify the influencing factors and evaluate them. their potential consequences. However, in this study, we limit the research overview to the effects of climate change on agriculture, and especially the effects related to fresh fruits.

Agriculture is one of the most vulnerable sectors to climate change. There has been quite a lot of research done to evaluate impacts of climate change on agricultural production. Based on the time series data from 1984 to 2017, (*Shakeel Ahmad et al., 2020*) highlighted the situation of the agriculture sector of Pakistan and empirically analyzed the short-run and long-run impact of Chinese foreign direct investment, climate change, and CO₂ emissions on agricultural productivity and causality among the variables. The ARDL model and Granger Causality test were employed to find out the long-run, short-run, and causal relationships among the variables of interest. The result showed that climate change and CO₂ emissions have a negative impact on the agricultural growth of Pakistan both in the short-run and long-run. Using the same research method, (*Yasemin Dumrul, Zerrin Kilicarslan, 2017*), (*Mohammed Shuaibu et al., 2020*) also showed different effects of temperature and rainfall on agriculture in Turkey and Nigeria in short and long term.

In addition to the overview studies on agricultural production, many specific agricultural commodities have also been studied on the direct effects of climate change, such as: (*Pervez Zamurrad Janjua, Ghulam Samad, Nazakatullah Khan, 2013*), (*Abbas Ali Chandio, Ilhan Ozturk, Habibullah Magsi, 2019*), (*Abbas Ali Chandio, Korhan K, Gokmenoglu, Fayyaz Ahmad, 2021*), (*Muhammad Nasrullah et al., 2021*), (*Inayatullah Jan, Muhammad Ashfaq, Abbas Ali Chandio, 2021*), (*Abbas Ali Chandio et al., 2022*),...

(*Pervez Zamurrad Janjua, Ghulam Samad, Nazakatullah Khan, 2013*) used the ARDL model and annual data from 1960 to 2009 to evaluate the impact of global climate change on the production of wheat in Pakistan. The results of estimation reveal that global climate change doesn't influence the wheat production in Pakistan. Also studying the effects of climate change on wheat production, (*Abbas Ali Chandio, Korhan K, Gokmenoglu, Fayyaz Ahmad, 2021*) reported that CO₂ emissions and temperature have a negative impact on wheat production in both the long and short term. In contrast, rainfall had a positive effect on wheat production in both cases.

(*Abbas Ali Chandio, Ilhan Ozturk, Habibullah Magsi, 2019*) explored the linkage between CO₂ emissions, average temperature, cultivated area, consumption of fertilizer, and rice production in Pakistan. The annual time series data from 1968 to 2014 were used to enhance the validity of the empirical outcomes. The ARDL bounds testing approach is applied to explore the effects of climate change on rice production. The main fruitful outcomes of this study are that rice production in Pakistan is positively affected by the CO₂ emissions in both long-run and short-run.

(*Inayatullah Jan, Muhammad Ashfaq, Abbas Ali Chandio, 2021*) study investigates the impacts of climate change on yield of selected cereal crops (wheat and maize) in the northern climatic region of Khyber Pakhtunkhwa province of Pakistan for the period 1986–2015. The empirical findings reveal that average precipitation has a significantly positive impact on yield of both crops in long- as well as short-run. The results further reveal that the effect of average minimum temperature on both crops is insignificant in long-run. However, the short-run effect of average minimum temperature is significantly positive on yield of maize crop but insignificant on yield of wheat crop. In long-run, an increase in average maximum temperature negatively affects crop yield. In short-run, however, it positively affects the yield of wheat and maize crops.

In Vietnam, there have been quite a few studies on the effects of climate change on agricultural production. (*Thai Minh Tin, Vu Van Long, Tran Hong Diep and Vo Quang Minh, 2018*) conducted research on the application of multi-criteria analysis in assessing the effects of climate change on agricultural production in the coastal provinces of the Mekong Delta, Vietnam. In the study of the impact of climate change on the productivity of some key agricultural products in the Red River Delta, (*Nguyen Dang Khoa, Nguyen Dinh Bau, 2022*) with OLS estimation with empirical model based on data for the period 2005 - 2020 has examined the impact of temperature and rainfall on the yield of key agricultural products including rice, maize and sweet potato. The results showed that the average annual temperature increase will have a negative effect on maize and sweet potato production, but it won't affect rice yield. Rice production may yield lower yields if the weather is higher than normal when cultivated in the cold months (Winter-Spring crop). On the other hand, the warming of the winter months is beneficial for sweet potato production. The experimental results also show that an increase in average monthly rainfall has a negative effect on rice yield; however, increased rainfall in less rainy months (dry season) is beneficial for maize production.

Besides, there have also been a number of studies on the impact of climate change on agricultural trade. Studying on the effects of climate change on agricultural trade in Central Asia, (*Xiaohua Yu, Hengrong Luo, Hanjie Wang & Jan-Henning Feil, 2020*) used Kazakhstan as an example to empirically analyze the effects of climate change on the grain trade by including them as determinants in the gravity model. The results of the study suggested that climate changes in Kazakhstan, measured by rainfall and temperature, could increase wheat, rice and maize imports, while decreasing wheat exports.

In general, studies in Vietnam and around the world have just only studied the effects of climate change on agricultural products and mainly on agricultural production. Many studies on the export of agricultural products have been published, but very few studies have shown the impact of climate change on this activity, and especially there have been no studies involved in this topic on fresh fruit. Therefore, the research team decided to carry out the study “Research on the effects of climate change on fresh fruit exports in Vietnam” on the basis of inheriting the achievements of previous studies and new findings on this issue in Vietnam.

3. CURRENT SITUATION OF VIETNAM FRESH FRUIT EXPORT TURNOVER AND WEATHER CONDITION

3.1. Current situation of fruit exports in Vietnam

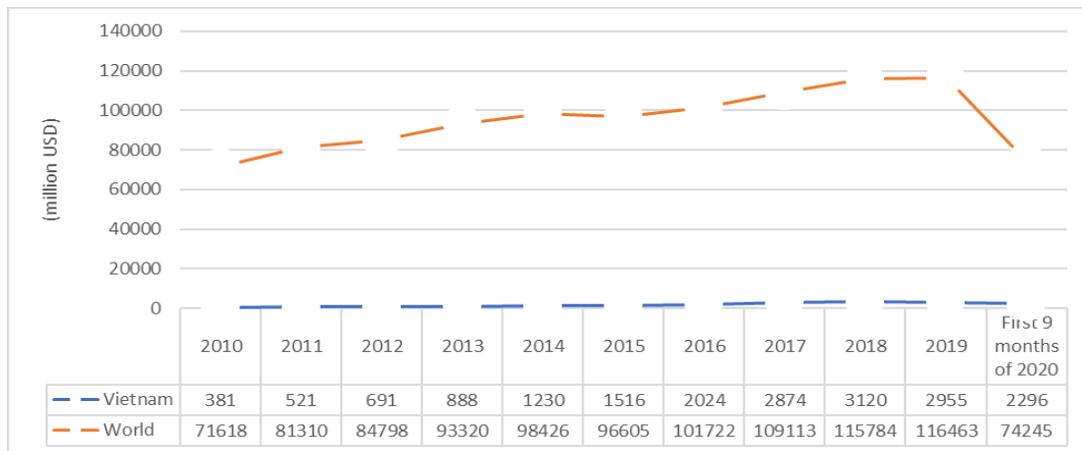

Table 3.1: Vietnam's and world's fruit export turnover.

Year	World (million USD)	Vietnam (million USD)	Proportion of Vietnamese fruit (%)
2010	97.399,5	405,5	0,42
2011	113.349,1	560,7	0,49
2012	117.208,0	746,1	0,64
2013	127.109,8	965,7	0,76
2014	131.777,8	1.340,1	1,02
2015	129.087,9	1.655,1	1,28
2016	134.441,3	2.214,9	1,65
2017	143.785,2	3.151,8	2,19
2018	151.822,7	3.437,1	2,26
2019	150.338,0	3.397,0	2,26
First 9 months of 2020	96.602,7	2.529,0	2,62

Source: Ministry of Agriculture and Rural Development

From 2010 to 2019, the global fruit trade experienced an average annual growth of 5.3%, with Vietnam’s fruit exports accounting for 80% of the total USD 3.26 billion of fruit and vegetable exports in 2020 despite the Covid-19 pandemic’s impact. However, Vietnam’s market share in the world is still small. Fresh fruits have a significantly higher market share than processed fruits in the global fruit export turnover, and Vietnam’s export turnover for fresh fruits is USD 2.3 billion, accounting for 90.8% while processed fruits accounted for USD 0.2 billion, equivalent to 9.2%. (Table 3.2).

Table 3.2: Export turnover of fresh fruits of Vietnam compared to the world

Source: Ministry of Agriculture and Rural Development

Vietnam’s fresh fruit exports exceed the world average at 90.8%. However, their export faces challenges due to Vietnam’s relatively low capacity for preservation and processing and underdeveloped logistics. Fruit exports in Vietnam have potential and prospects, but face difficulties such as product quality management, unstable weather, competition, and insufficient research and development investment. With proper policies, management, and technology, Vietnam’s fruit production can grow strongly, sustainably, and expand further into international markets.

3.2. Current situation of Vietnam’s weather condition

The current situation of temperature change due to climate change in Vietnam

Vietnam has a high average temperature, ranging from 24-25°C. Climate change is causing an increasing trend in the average temperature.

Figure 3.1: Average temperature of Vietnam in the period of 2000-2021

Unit: °C - Source: Trading Economics

The average temperature of Vietnam has fluctuated but shows an increasing trend, with an average temperature of 24.79°C, 0.29°C higher than the temperature standard of 1970-2000, and gradually increasing over the decades

The average temperature across the country is increasing, resulting in prolonged droughts and heatwaves throughout the country. Droughts reduce crop yields, cause water shortages for irrigation, and even pose a risk of desertification, reducing the area available for cultivation and thus reducing the export of fresh fruits.

The current situation of precipitation change due to climate change in Vietnam

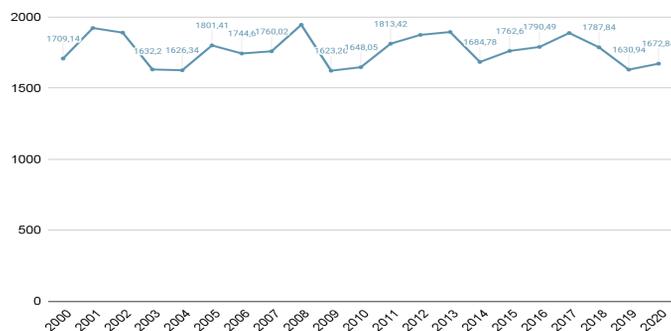

Figure 3.2: Average rainfall in Vietnam in the period of 2000-2021

Unit: mm - Source: WB

The average rainfall in Vietnam has slightly increased over the decades, with irregular fluctuations, averaging 1766.89mm in the period of 2000-2021. However, extreme weather phenomena are becoming increasingly complex, with signs of increasing frequency and scope of impact, as reported in the National Environmental Status Report for 2016-2020. By the end of the 21st century, annual rainfall may increase by about 5% compared to the 1980-1999 average, and sea levels may rise by an additional 75cm, according to the Ministry of Natural Resources and Environment.

Floods and rising sea levels will cause loss of arable land in agriculture. According to the Climate Change Scenarios released in 2020 by the Ministry of Natural Resources and Environment, the average sea level rise for the entire East Sea region by 2050 is projected to be 24 to 28 cm, leading to saltwater intrusion in coastal areas and a reduction in agricultural land area, thereby decreasing the export of fresh fruits from Vietnam.

The current situation of CO2 emission change due to climate change in Vietnam

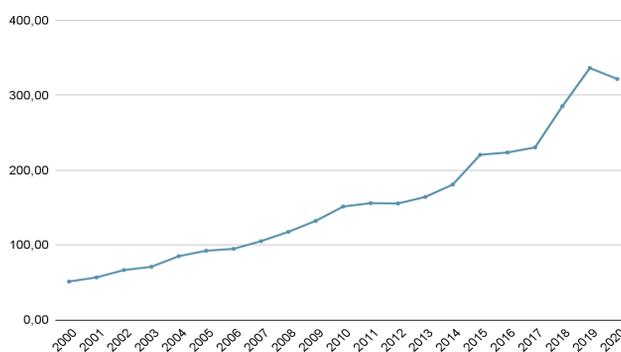

Figure 3.3: Total CO2 emissions of Vietnam in the period of 2000-2020

Unit: million tons - Source: WB

CO₂ emissions in Vietnam have rapidly increased over the years, rising 6.5 times from 51.21 million tons in 2000 to a high of 336.49 million tons in 2019. In the period of 2010-2020, the increase in CO₂ emissions was twice as high as the previous decade. In 2020, the energy sector (including transport activities) accounted for the highest percentage of CO₂ emissions at 62%, followed by the agricultural sector at 18%, the industrial process and product use at 14%, and waste at 5%. (MPI, UNDP, USAID 2022) (Department of Social and Environmental Issues - Ministry of Planning and Investment, 2022).

4. DATA AND ESTIMATION MODEL

4.1. Model

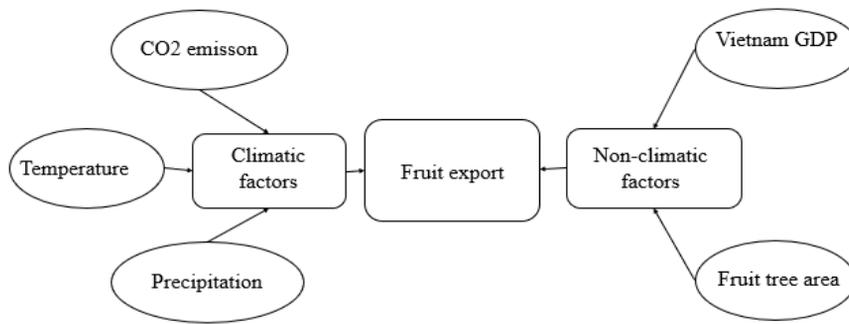

To determine the impact of climate change on fresh fruit export activities in Vietnam, the research team will observe and analyze three weather variables, including CO₂ emissions, temperature, and rainfall, as well as two non-weather variables, Vietnam's GDP and the area of fruit trees in the country. The division of variables into weather-related and non-weather-related ones is inspired by the study "Addressing the Long and Short-Term Impacts of Climate Change on Major Food Crop Production in Turkey" (Abbas Ali Chandio, Korhan K, Gokmenoglu, Fayyaz Ahmad, 2021). This division helps us identify the direct (weather-related) and indirect (non-weather-related) impacts of climate change, thereby providing the most accurate and objective analysis of the effects of climate change on fresh fruit export activities in Vietnam.

Regarding the selection of variables, the research team found that temperature, rainfall, and CO₂ emissions are the factors that directly affect fruit production yields. These variables are fundamental factors for assessing climate change and have been widely used in previous studies. However, the results of these studies have been inconsistent, with the same factor producing different positive and negative outcomes. For example, while a study on the impact of climate change and other factors on rice production in Korea by Muhammad Nasrullah and colleagues (2021) based on variables such as CO₂ emissions, average temperature, and rainfall showed that an increase in CO₂ emissions in Korea could significantly increase rice yields, a 1% increase in average temperature could increase rice yields by 1.16%, and a 1% increase in rainfall could reduce rice yields by 0.13%. In contrast, a study by Abbas Ali Chandio, Korhan K, Gokmenoglu, Fayyaz Ahmad (2021) on the long- and short-term impacts of climate change on major food crop production in Turkey showed that CO₂ emissions had a negative impact on wheat production in both the short and long terms, increased temperatures in Turkey had adverse effects on wheat production, and rainfall had a positive effect on wheat production. Therefore, the research team decided to choose these three variables to analyze and accurately evaluate the impact of climate change on fruit trees in Vietnam.

For non-weather-related variables, the area of fruit trees reflects the degree of environmental response and government policies to fruit production and demonstrates the production yield and export capacity of Vietnam. Vietnam's GDP helps evaluate some aspects of the country's fresh fruit export activities. When a country has a high GDP, it indicates a large production capacity, resulting in more exports. Therefore, selecting Vietnam's GDP is expected to have a positive impact on fresh fruit export activities in the country.

Factors such as drought and saline intrusion were not considered in this study because comprehensive data on these factors have not been collected and analyzed across the country. In addition, the measurement and evaluation methods for these factors are not yet standardized, making it difficult to analyze using the research model chosen by the authors.

This model shows the factors affecting the amount of fruits exports of Vietnam

To find the relationship between the dependent variable and the independent variable, the model is built based on the model of Pervez Zamurrad Janjua, Ghulam Samad, Nazakatullah Khan, (2013) Abbas Ali Chandio, Ilhan Ozturk, Habibullah Magsi, (2019) Shakeel Ahmad et al., (2020), Inayatullah Jan, Muhammad Ashfaq, Abbas Ali Chandio, (2021), Abbas Ali Chandio et al., (2022) as follows:

$$\ln XK_t = \alpha_0 + \beta_1 \ln Ttb_t + \beta_2 \ln Rtb_t + \beta_3 \ln KT_t + \beta_4 \ln DT_t + \beta_5 \ln GDP_t + \vartheta_t \quad (1)$$

In Eq. (1): XK denotes the fresh fruits export, Ttb represents the average annual temperature, Rtb is the average annual precipitation, KT is the total CO₂ emissions, DT is the fruit trees area, GDP stands for the total GDP of Vietnam, α_0 is the constant, $\beta_1, \beta_2, \beta_3, \beta_4, \beta_5$ represent for regression coefficients, t is time ($t = 2000, 2001, \dots, 2021$), and $\vartheta_t \vartheta_t$ is normal white noise.

4.2. Data

The study used yearly time-series data covering the period of 2000 to 2021. This includes data on average annual temperature, average annual rainfall, total CO₂ emissions, Vietnam's total GDP, which are collected from the World Bank organization (World Bank - WB), and the fruit tree area of Vietnam is collected from the General Statistics Office of Vietnam. The export value of fresh fruit products is gathered from Food and Agriculture Organization of the United Nations (FAOSTAT)..

4.3. Estimation method

This study uses Autoregressive Distributed Lag (ARDL) model to estimate the influence of the factors of average annual temperature (Ttb), average annual precipitation (Rtb), total CO₂ emissions (KT), fruit trees area (DT), total real GDP of Vietnam (GDP) to fresh fruit exports (XK) and find out the relationship between them.

The ARDL method proposed by Pesaran & Pesaran (1997) has several advantages. In cases where the sample size is small, this approach is more statistically meaningful than the Johansen cointegration technique for testing for cointegration. It is also suitable for achieving both short- and long-run elasticity in a small sample size and follows the least squares estimation (OLS). Additionally, if the authors cannot ensure the stationarity or non-stationarity properties of the data system, the I(0), I(1), or mutually cointegrated models are suitable for the ARDL procedure in experimental studies. However, it fails when I(2) is present in any variable.

The ARDL cointegration process consists of two steps:

Step 1: Bound test determines cointegration between variables. If the test results show that a merge exists, we move on to step 2. Otherwise, if there is no merge, the process is terminated and the ARDL model cannot be applied.

Step 2: Estimate long-run coefficients and short-run coefficients of ARDL and Error Correction Models (ECM).

For long-term numerical system estimation, we will use the OLS (Least Squares) method to compute the ARDL model on the database that was identified as merged in Step 1. Then, we estimate the system to shorten the time through error correction configuration (ECM). The ECM model helps to measure the rate at which the dependent variables adjust back to long-term equilibrium after each adjustment from the time deviation.

The end result is computational estimation and error correction modeling (ECM) systems, which enable cointegration analysis between variables and measure time and limit effects between them.

After finding out the relationship exists between the variables, the study uses Error Correction Model (ECM) to find the short-term dynamics and built under the following equation:

$$\Delta \ln XK_t = \alpha_0 + \beta_1 \ln Ttb_{t-1} + \beta_2 \ln Rtb_{t-1} + \beta_3 \ln KT_{t-1} + \beta_4 \ln DT_{t-1} + \beta_5 \ln GDP_{t-1} + \sum_{i=1}^p \gamma_i \Delta \ln XK_{t-i} + \sum_{j=0}^q \delta_j \Delta \ln Ttb_{t-i} + \sum_{j=0}^q \theta_j \Delta \ln Rtb_{t-i} + \sum_{j=0}^q \rho_j \Delta \ln KT_{t-i} + \sum_{j=0}^q \mu_j \Delta \ln DT_{t-i} + \sum_{j=0}^q \vartheta_j \Delta \ln GDP_{t-i} + \tau ECM_{t-1} + \varepsilon_t \quad (2)$$

Where: Δ represents the difference, τ is coefficient of ECM_{t-1} , representing the adjustment speed of the parameter, ECM is rate of adjustment to long-run equilibrium after a short-run shock.

5. RESULTS AND DISCUSSION

5.1. Research results

5.1.1. Unit root test

Table 5.1: Results of Augmented Dickey-Fuller

Variable	ADF
ln(XK)	0,8993
ln(XK)	0,0001***
ln(KT)	0,7666
ln(KT)	0.0010***
ln(Ttb)	0,0153
ln(Ttb)	0,0000***
ln(rtb)	0,0024
ln(rtb)	0,0000***
ln(GDP)	0,5886
ln(GDP)	0.0113**
ln(DT)	0,9099
ln(DT)	0.0184**

Source: Author's calculation

Note: This table shows the results of the Dickey Fuller test, the number showing the p-value of the test without the propensity parameter. ***, **, * represent significance at 1%, 5%, and 10%, respectively.

The test results of the enhanced Dickey-Fuller model (ADF) presented in Table 5.1 show that the variables ln(Ttb) and ln(Rtb) remain constant at the data level (I (0)) at significance level 1%. On the other hand, there is no fixed level of output data with factors such as ln(XK), ln(KT), ln(GDP) and ln(DT). However, when testing the stationarity of the data series in the form ln for the variables XK, KT, GDP and DT at the first difference at 5% significance level, the data series are stationary. Therefore, the data series of the variables are suitable for use in this study.

5.1.2. ARDL bound test

Table 5.2: Constraint F test results

Statistics F (Dependent variable: XK)	Level of significance	Important binding value (Pesaran et al., 2001)	
		I(0)	I(1)
20.675***			
	1%	4.29	5.61
	5%	3.23	4.35
	10%	2.72	3.77

Source: Author's calculation

Note: The numbers in parentheses are p-values: ***, **, * represent significance at 1%, 5%, and 10%, respectively.

The presence of cointegration between variables is tested using the binding test method. Accordingly, the results presented in Table 5.2 show that the estimated F-statistic value (20,675) is larger than the critical values of 1%, 5% and 10% respectively. Therefore, the results of the bound F test supported the rejection of the null hypothesis H0 of no co-integration, and at the same time indicated the existence of a long-term relationship between the variables. This implies that there is a cointegration between Vietnam's fresh fruit exports and other key determinants of the model. The existence of cointegration supports the analysis of short-term and long-term relationships of factors affecting fresh fruit exports in Vietnam.

5.1.3. Estimation of long-run and short-run coefficients of related ARDL (Long-run & Short-run)

Table 5.3: Estimated long-term outcomes using the ARDL model

Variable	ln(XK)	P-value	Standard error	t-Statistics
ln(KT)	-7.336**	0.177	4.475	-1.64
ln(Ttb)	-8.740*	0.067	39.543	2.50
ln(GDP)	5.695*	0.098	2.650	2.15
ln(Rtb)	37.380	0.395	41.843	0.89
ln(DT)	21.528	0.244	17.259	1.25
R ²	0.957			
R ² adjust	0.820			

Note: The P-values of the coefficients are reported in parentheses. The numbers in parentheses are p-values: ***, **, * represent significance at 1%, 5%, and 10%, respectively.

The results show that: the variable ln(KT) has a P-value of 0.177 greater than the 0.1 significance level, so the variable ln(KT) has no long-term impact on the variable ln(XK) means that the average emissions has no significant long-term impact on Vietnam's fresh fruit exports. Meanwhile, the other two variables ln(Ttb) and ln(GDP) have P-values of 0.067 and 0.098 respectively, less than 0.1 significance level; and has a positive elasticity coefficient, so the two variables mean annual temperature and total real GDP have a positive impact on fresh fruit exports in the long run with a confidence level of 10%. Surprisingly, variable proxied for rainfall level (Rtb) shows no significant relationship with the dependent variable

The variable ln(Ttb) has a P-value of 0.067 and a positive long-term elasticity coefficient of 98.740 with a confidence level of 10%, meaning that annual mean temperature is positive with the ability to export fruit, that is if the average annual temperature increases by 1%, the ability to export fruit will also increase by

98%. This can be explained that, in the long term, to adapt to changing temperatures, farmers are interested in switching to new production models and application of new varieties that are less affected by the weather. Moreover, when the temperature of the region increases, the demand for fruits to cool down will also increase, leading to an increase in exports in the long term, especially during the peak hot months of summer.

The variable $\ln(\text{GDP})$ has a P-value of 0.098, a long-run elasticity of 5.695 with a significance level of 10%, which means that the average real GDP has a positive effect on the amount of fruit exported, which means that on average, if Vietnam’s total real GDP increases by 1%, the amount of fruit exports will also increase by 5% in the long run. This can be explained by the fact that sustainable economic growth leads to the expansion of overall export capacity. As GDP increases, investments in infrastructure, transportation, and agricultural technology are improved, enhancing the productivity and efficiency of the agricultural sector. This can improve the quality and shelf life of fruits, enabling them to have a higher competitive advantage in the international market, thereby increasing fruit production and exports. Furthermore, over time, as the domestic market expands and stabilizes, exporters can seek opportunities in the international market to generate additional revenue. Exporters can target new markets and establish trade relationships with other countries by negotiating trade agreements with international partners. These trade agreements can help reduce trade barriers and create more favorable conditions for fruit exports. Accessing new markets and strengthening trade relations can expand the volume of fruit exports in the long term.

The variable $\ln(\text{KT})$ has a P-value = 0.177 greater than the 0.1 significance level, so the variable $\ln(\text{KT})$ has no long-term impact on the variable $\ln(\text{XK})$ meaning that the average emissions have no impact in the long run to Vietnam’s fruit exports. Recognizing that CO2 emissions are the main cause of climate change, many countries, including Vietnam, are increasingly aware and better prepared to deal with climate change-related issues. In the long term, Vietnamese businesses can adapt to climate change by adopting modern technologies and changing production methods to reduce environmental impact and enhance sustainability in the industry. For example, the use of automated irrigation systems and soil moisture sensors helps save water and ensure efficient water usage. Wastewater treatment technology can also be applied to treat and reuse wastewater from the fruit production process. The proper use of organic fertilizers, appropriate land and water management practices, and reducing the use of prohibited substances in the production process are other examples of measures that can be taken...

Table 5.4: Short-term results

Variable	Coefficient	P-value	Standard error	t-Statistics
$\ln(\text{KT})$	3.959**	0.013	.930	4.26
$\ln(\text{Ttb})$	-4.921**	0.003	6.747	-6.36
$\ln(\text{GDP})$	-1.954**	0.020	.521	-3.75
$\ln(\text{Rtb})$	2.860*	0.066	1.370	2.09
$\ln(\text{DT})$	1.856	0.191	1.313	1.41

Source: Author’s calculation

*Note: The P-values of the coefficients are reported in parentheses. The numbers in parentheses are p-values: ***, **, * represent significance at 1%, 5%, and 10%, respectively.*

All three variables $\ln(\text{KT})$, $\ln(\text{Ttb})$, $\ln(\text{GDP})$ are significant in the short run because they have a P-value of 0.013; 0.003; 0.020 respectively, which is less than 0.05 significance level. These results can be explained in detail as follows:

Although CO2 emissions are not significant in the long run, for the short-term model it still has a negligible impact. The short-run coefficient of CO2 emissions of 3.959 shows that a 1% increase in emissions on average results in a 3% increase in fruit exports. As international demand for fruits increases,

the production and export of fruits also increase. Strengthening fruit production activities to meet the demand can result in increased use of transportation and industrial processes, leading to increased CO₂ emissions. Therefore, in the short term, CO₂ emissions reflect the growth potential of the industry, and they are synchronized with export turnover.

Although mean annual temperature has a positive effect in the long term (Table 5.3), it has a negative effect on fruit exports in the short term with a short-term coefficient of -42.921. This shows that a 1% increase in the average annual temperature of Vietnam results in a 42% decrease in fruit exports in the short term. In fact, the increased temperature and prolonged heat have a significant effect on the flowering and fruiting of many crops, which not only reduces crop yield but also lowers fruit quality. The quality and design of the fruit do not meet export standards, thereby affecting the source of raw materials for processing and exporting. Moreover, in the short term, producers, especially farmers, have not adapted and responded in time, leading to a decrease in production, leading to a decrease in fruit exports. On the contrary, in the long term, producers research and apply varieties and models that can withstand heat, so the export volume also increases over time.

Similar to the variable $\ln(Ttb)$, the annual average GDP has the same effect in the long run but opposite in the short run with the short-run coefficient of -1.954. This suggests that if average annual GDP increases by 1%, exports fall by 1% in the short run. This can be explained by the fact that in the short term, when GDP increases, it affects the domestic economic conditions and the supply and demand in the domestic market. If the average per capita income is higher, it leads to increased consumer spending, thereby increasing domestic demand. As a result, meeting domestic demand becomes a priority, and the quantity of fruits for export may decrease in the short term. In another sense, short-term GDP growth can lead to an increase in the demand for domestic resources and materials, especially when production needs increase. If this demand cannot be met through domestic production, the country will have to import resources or products from other countries. This can lead to increased production costs and product prices, making the country's products more expensive in the international market and reducing its competitiveness. Additionally, short-term GDP growth can also create disparities among industries within the country. Some industries may develop faster and attract more investment, causing the country's export products to focus on specific items. This has a two-sided impact on the export of fruits in Vietnam, as rapid growth may lead to increased investment but also a decrease in export volume.

5.2. Discussion and recommendation

In short term:

An increase in temperature negatively affects exports in the short term, highlighting the need for solutions to mitigate the impact of climate change. Vietnam's average temperature increase is part of global warming, which requires collective efforts from all countries to reduce. However, the Vietnamese government can also implement policies as follows to address this issue.

First, encourage the use of clean and renewable energy. This not only helps to mitigate the temperature increase due to climate change but also helps to reduce production costs and mitigate the impact of climate change. The Vietnamese government has policies to prioritize the use of clean energy, but it is still limited in some farming areas due to investment costs and a lack of skilled labor.

Second, efficient energy usage is key for sustainable agriculture and fruit production. Advanced technologies such as drip irrigation, monitoring devices, and automatic control can minimize water usage and increase productivity. The Vietnamese government has set requirements for sustainable agriculture, but it requires closer coordination from businesses and farmers, as well as investment in new technologies to save and use water more effectively.

Third, recycling waste in agricultural and fruit production. Recycling organic waste from fruit production can produce natural fertilizers and energy, as well as other useful products like paper, packaging, and building materials. Although many farmers use this method to reduce waste and use resources sustainably, it is currently small-scale and self-initiated, and has not yet produced significant results. Businesses and governments need to invest in research to standardize and replicate these agricultural waste recycling models on a larger scale.

In long term:

Rising temperatures negatively affect short-term fruit exports due to their impact on crop quality and productivity. However, the results suggest that in the long term, fruit exports may increase due to adaptation, change, and innovation by the government, businesses, and people.

First, research new high-quality crop varieties with good adaptability to harsh natural conditions. In fact, many new crop varieties have been researched and tested in Vietnam. This has resulted in promising economic benefits, but challenges remain, including small-scale and scattered research efforts, inadequate infrastructure and technical services, and a lack of irrigation and cold storage facilities in some areas. Therefore, the government and businesses need to invest more in physical infrastructure during the research and application process, as well as collaborate with more developed countries in this field.

Second, applying scientific and technical advancements to agricultural production in Vietnam can improve productivity and quality. Businesses can learn from techniques used in developed countries but must also adapt them to suit local conditions. Many businesses have successfully implemented VietGAP standard intensive farming processes for various crops and utilized modern equipment and machinery to increase productivity and quality. However, the application of scientific and technological advancements to agricultural production in Vietnam is still primarily small-scale, and few agricultural businesses use high technology in their production. As a result, the quantity and quality of agricultural products produced are insufficient for competing in demanding markets. The government needs to have investment policies and incentives in this field, while businesses must cooperate and exchange experiences to develop sustainably together.

In addition, the results showed that GDP growth leads to long-term export increase. Thus, the government and businesses should enhance production and increase value-added in agriculture to contribute to GDP growth.

First, investment in infrastructure. This includes investment in agricultural infrastructure like irrigation, power systems, internal transport routes, and warehouses, which can transform agricultural production towards intensive cultivation and attract businesses to invest in agriculture. This can enhance transportation and production capabilities, facilitating the export of agricultural products and increasing GDP.

Second, encourage technology, capital, and labor transfer. This measure is crucial for enhancing Vietnam's fruit production and export capacity and strengthening its competitiveness and economic development. However, Vietnam faces challenges in this area, including unfavorable investment policies and administrative procedures that hinder investment and technology transfer, as well as a shortage of skilled labor in agriculture. The government needs to have effective policies to address these issues.

6. CONCLUSION

This study focuses on assessing the relationship between climate change and fresh fruit exports in Vietnam. Research data is time series data for the period 2000 - 2021 collected through the Statistical Yearbook of the General Statistics Office of Vietnam and the World Bank.

Analysis of fresh fruit export status, climate change issues and factors related to climate change affecting fresh fruit export in Vietnam. Studying and quantifying climate change factors affecting Vietnam's fresh fruit exports through the ARDL lagged autoregressive model proposed by Pesaran et al (2001).

The contour tests, ARDL tests and ECM tests show that mean emissions have no significant long-term impact on Vietnam's fresh fruit exports, and mean temperature and real GDP have an impact positive effect on fresh fruit exports in the long run. While CO₂ emissions are not significant in the long run, the short-term model does. Both annual average temperature and average annual GDP have a negative impact on fresh fruit exports in the short term, and a positive impact on the long term.

Finally, on that basis, the thesis offers solutions and recommendations to the Government, business and farmer in short term as well as long term based on the important policy implications of the variables in order to minimize the effects of climate change on fresh fruit exports. Vietnam. This study will continue to develop more extensive follow-up studies by adding to the empirical model other macroeconomic factors such as methane (CH₄), sea level rise and possible industrialization. exists a relationship with Vietnam's fresh fruit exports in both the short and long term.

RESEARCH THE IMPACT OF FREE TRADE AGREEMENTS (FTAS) ON EXPORT OF VIETNAMESE GOODS

Author: Pham Phuong Anh¹, Bui Thu Trang¹, Le Khanh Thao Chi¹, Pham Hoai Linh¹

Mentor: Doan Nguyễn Minh¹

Abstract: *The theory of international trade suggests that free trade agreements promote trade through the removal of tariff and non-tariff barriers, as well as creating a transparent foundation for trade through regulations on labor, investment, and intellectual property. However, practical studies show that the overlap and complexity of free trade agreements can also nullify the positive effects of these agreements or even bring about contradictory effects. Therefore, this article examines the impact of free trade agreements (FTAs) on the export of Vietnamese goods on the basis of data in the period from 2011 to 2021 based on the use of gravity model and PPML maximum estimation method to have a basis for proposing some solutions to improve Vietnam's export competitiveness. The results of the research show that the disproportionality in the impact of free trade agreements, while the agreements between ASEAN and Japan, Australia, New Zealand as well as the Vietnam Chile Agreement, the Trans-Pacific Progressive Agreement (CPTPP) have a positive impact on Vietnam's exports, the remaining agreements have no impact or negative impact on exports.*

Keywords: *FTAs, Vietnam Export*

1. INTRODUCTION

According to the World Trade Organization (WTO), more than 200 free trade agreements are now in effect, and Vietnam has signed 15 FTAs thus far. Vietnam is also one of the few nations in the Asia-Pacific region to have implemented three new-generation FTAs. It demonstrates that Vietnam is actively interacting more with other economies to present chances to increase competitiveness, foster economic development, and enhance people's lives.

Moreover, the data changes every year and is based on fluctuations in the world, along with the establishment of new FTAs as well as the increasingly complete old FTAs, leading to the impact of FTAs on exports of countries that are always up to date. As a result, ongoing research into the effects of free trade agreements is necessary because it is always changing.

In particular, FTAs are believed to have a positive impact such as according to the articles "Participation in FTAs brings many positive impacts to the Vietnamese economy (Ministry of Industry and Trade of the Socialist Republic of Vietnam 9/2020), New-generation free trade agreements (FTAs) to facilitate the development of production and business activities (Ministry of Industry and Trade of the Socialist Republic of Vietnam 1/2022) or Market expansion from FTA free trade agreements (VTV News 11/2022). However, many researchers think that overlapping FTAs can cause complexity, leading to businesses having difficulties in using or using inefficiently as well as not taking advantage of tariff incentives from FTAs. In addition, Vietnam is still dependent on traditional markets in the short term despite signing FTAs with numerous partners, or for agreements: the EVFTA, CPTPP, RCEP... Vietnamese businesses will focus on doing business primarily with big markets while less interested in the small market. From there, the FTA has the opposite effect or no impact. Therefore, further research is needed to assess the impact of free trade agreements on the economy to promptly propose solutions to promote the advantages brought by FTAs as well as to recognize the negative aspects to take appropriate preventive and remedial measures.

¹ Thuong Mai University.

Stemming from the urgency of the above issue, the research team decided to learn about the topic “Research the impact of free trade agreements on the export of Vietnamese goods”. The article uses statistics and data of the General Statistics Office, Worldbank, Database System of Industry and Trade to analyze and describe the situation of goods exports of Vietnam in recent years under the impact of FTAs. In addition, the research uses gravity models, the maximum PPML estimation method and data related to trade relations between Vietnam and 40 partner countries between 2010 and 2021 from data of the World Bank, Trademap, CEPII - GeoDist, WTO – RTA database... to assess the impact of FTAs on Vietnam’s goods exports. Based on the situation of Vietnam’s goods exports and the results of using the gravity model to assess the impact of free trade agreements, the group will make recommendations to help Vietnam make the most of its opportunities when participating in and signing such free trade agreements in the coming time.

2. OVERVIEW OF RESEARCH ON THE IMPACT OF FTAS

2.1. Relevant foreign studies on the impact of Free Trade Agreements (FTAs) on trade

Given the importance of free trade agreements, a significant number of studies have employed different methods to assess the impact of FTAs on international trade flows. Nguyen Thi Anh’s research (2020) used qualitative analysis to evaluate the impact of FTAs on international trade. By collecting and analyzing data, this research explored the factors and trends related to the impact of FTAs on international trade. Furthermore, there are comprehensive studies that use meta-analysis to synthesize findings from previous studies regarding the impact of FTAs on international trade, such as Smith’s research (2018). Although these studies do not directly address Vietnam’s goods exports in a specific period, they provide an overview of the impact of FTAs on international trade that can be applied to understand the impact of FTAs on Vietnam’s exports. However, these studies only indicate the general trends between FTAs and trade flows without fully estimating the direction and intensity of the impact of FTAs on trade flows.

To address this issue, several studies have applied estimation models to more accurately assess the impact of FTAs on international trade.

Prominently, Anderson and van Wincoop (2003) used the Gravity model to estimate the impact of FTAs on international trade flows and concluded that FTAs have a positive and significant effect. Baier and Bergstrand (2007) also applied the Gravity model and found that FTAs indeed enhance international trade among agreement members. Additionally, Fontagné and Freudenberg (2006) analyzed the vertical and horizontal components of trade in international trade relationships, providing an overview of the impact of FTAs on structural changes and trade flow directions. By combining these results, we can gain a better understanding of the impact of FTAs on exports and international trade. However, these studies only reveal general trends and have not estimated the specific intensity and direction of the impact of FTAs on trade flows.

2.2. Relevant research on the impact of FTAs on Vietnam’s exports

The research conducted by Tran Van Binh (2019) and the research by Le Quang Tien (2019) both focus on the impact of FTAs on Vietnam’s exports. While Tran Van Binh’s research utilizes a case study approach, Le Quang Tien’s research employs the Gravity model. Both studies use export data and economic indicators to measure the impact of FTAs on Vietnam’s export value and market share. The combination of the case study approach and the Gravity model provides a multidimensional view of the impact of FTAs on Vietnam’s exports, from understanding the specific impacts on the export structure to evaluating the overall value and market share of exports.

The studies by Nguyen Minh Quang and Nguyen Thi Hien also focus on the impact of FTAs on Vietnam's exports; however, they concentrate on different aspects of exports. Nguyen Minh Quang's research (2016) focuses on the impact of FTAs on Vietnam's export competitiveness. This research uses linear regression and evaluates the impact of FTAs on important factors such as product quality, technology, price, and delivery time. Additionally, the research provides proposals to enhance Vietnam's export competitiveness. On the other hand, Nguyen Thi Hien's study (2018) focuses on the impact of FTAs on Vietnam's export diversification. Using export data from 2000 to 2016 and employing linear regression, this research measures the impact of FTAs on the diversification of Vietnam's export products and identifies important factors influencing the diversification process.

There does not seem to be any research that comprehensively studies the impact of all FTAs on Vietnam's exports. This creates a research gap that needs to be addressed. Therefore, this article proposes the use of the gravity model to estimate the impact of FTA agreements on Vietnam's export value and provide recommendations for enhancing the competitiveness of Vietnamese businesses. By applying the gravity model, this research can provide detailed information on the impact of FTA agreements on Vietnam's export value. The gravity model allows for analyzing the interactions between economies in a global system, thereby assessing the benefits and impacts of FTAs on Vietnam's export sector. The results of the research will provide valuable information for government and businesses in strategic orientation and development planning regarding FTA information. Additionally, regulatory agencies and relevant organizations can utilize the research findings to construct supportive policies and further develop other FTAs, thereby increasing competitiveness in the domestic export market.

3. THE SITUATION OF GOODS EXPORT OF VIETNAM IN RECENT YEARS UNDER THE IMPACT OF FTAS

3.1. Status of signing and participating in FTAs of Vietnam until the end of 2021

Up to now, Vietnam has officially joined and signed 14 FTAs and currently 2 FTAs are in the process of negotiation. The fact that Vietnam has successfully negotiated and signed many FTAs with bilateral and multilateral trading partners has created many opportunities for economic growth and market diversification. Exporters and importers create jobs and raise incomes for domestic workers. Specifically, there are 3 FTAs bilateral agreement was signed Vietnam - Japan Economic Partnership Agreement (VJEPA - effective 2009), Vietnam - Chile Free Trade Agreement (VCFTA - effective 2014), Vietnam Free Trade Agreement - Korea (VKFTA - 2015); 6 multilateral FTAs include ASEAN Free Trade Area (AFTA - 1993), ASEAN - China Free Trade Agreement (ACFTA - 2003), ASEAN - Korea Free Trade Agreement (AKFTA - 2007), Economic Partnership Agreement the ASEAN - Japan Comprehensive Economic Partnership (AJCEP - 2008), the ASEAN - India Free Trade Agreement (AIFTA - 2010), the ASEAN - Australia and New Zealand Free Trade Agreement (AANZFTA -2010); and 5 FTAs are considered as new generation FTAs including: Free Trade Agreement of Vietnam - Eurasian Economic Union (VN-EAEU FTA -2016), the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP - 2019), ASEAN Free Trade Agreement and Hong Kong (China) (AHKFTA - 2019), Vietnam - European Union Free Trade Agreement (EVFTA - 2020), Vietnam - UK Free Trade Agreement (UKVFTA - 2021).

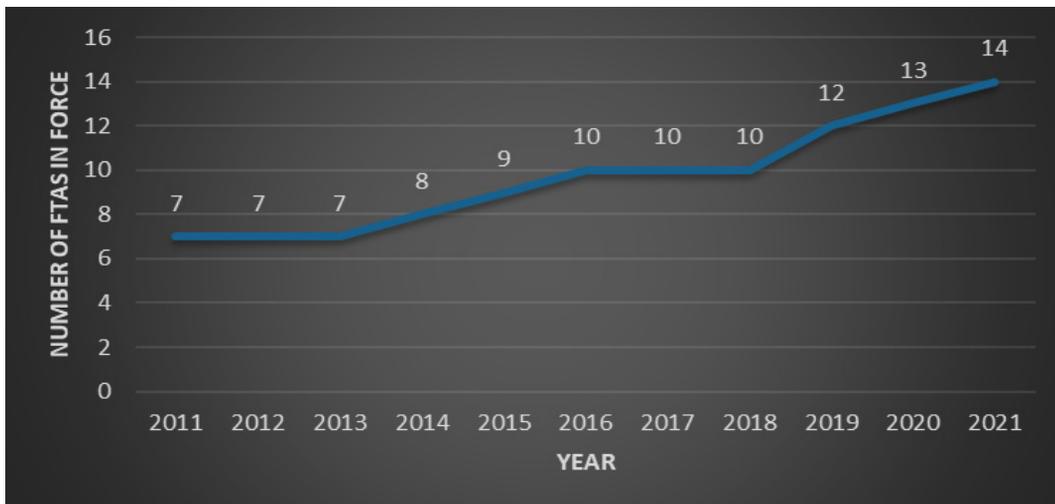

Chart 1. Number of effective FTAs that Vietnam has signed by year period 2011 - 2021

Source: VCCI

- **The FTAs Vietnam is negotiating include:**

The Free Trade Agreement between Vietnam and the EFTA (VN-EFTA FTA) (including 4 countries Switzerland, Norway, Iceland, and Liechtenstein) started negotiating in May 2012. Currently, this FTA is still in the negotiation process.

Free Trade Agreement between Vietnam and Israel (VIFTA): was started to negotiate on December 2, 2015, currently this FTA is still in the negotiation process.

Thus, countries that share many trade agreements with Vietnam can be mentioned as China, Japan, Korea, Chile, Australia, New Zealand, Brunei, Singapore and Malaysia.

3.2. Current status of export turnover of Vietnam

- **Exports**

In the period 2010 - 2021, Vietnam’s export turnover continuously increased. This trend coincides with the trend when participating in the free trade agreements of Vietnam. Statistics show that Vietnam’s total export turnover has increased from 72.24 billion USD in 2010 to 335.79 billion USD in 2021. Accordingly, export turnover is 4.65 times higher after 11 years. On average, during the whole period, Vietnam’s export turnover reached about 187.1 billion USD/year.

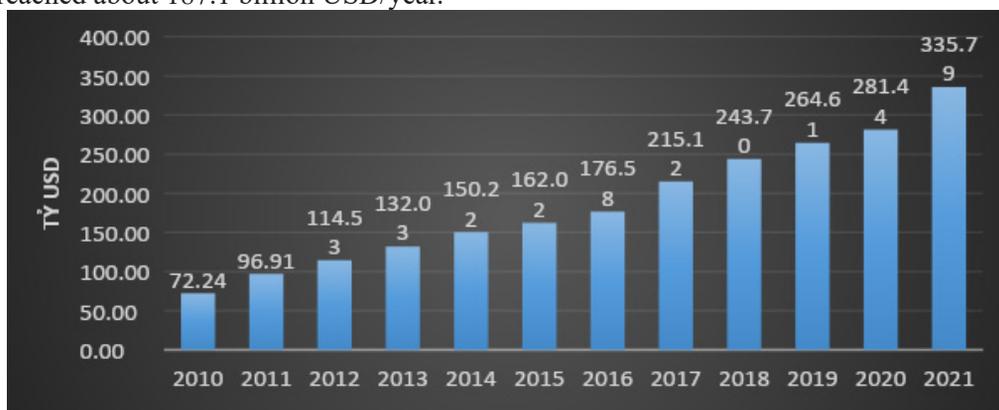

Chart 2. Export turnover of Vietnam over each year in the period 2010 - 2021

Source: Trademap

In terms of growth rate, export growth in the 2010-2021 period averaged 16.2 %/year. In recent years, the export of goods has changed markedly in terms of quality, reflected in the restructuring of export goods. Accordingly, the structure of goods has a positive shift among commodity groups and is directed toward the core of industrialization. Specifically, at present, the industrial goods group accounts for over 80%; followed by the group of agricultural products and aquatic products accounting for over 10% and the group of fuels and minerals accounted for just over 1% of total export turnover.

The proportion of Vietnam's exports through major export markets (US, China, Japan, South Korea) has generally grown markedly with the active participation and signing of bilateral and multilateral agreements. The US remained Vietnam's largest export partner between 2010 and 2021.

In 2010, the ASEAN Trade in Goods Agreement (ATIGA) took effect, bringing intra-regional trade relations to a new stage. In the period 2010 - 2021, exports between Vietnam and ASEAN countries have grown significantly, from 12.35 billion USD in 2010 to 86.33 billion USD in 2021, increasing 7 times. Free trade agreements in ASEAN also play an important role in this achievement. However, this agreement also brings certain difficulties, especially in the issue of competition for "unfair" goods. Specifically, for agricultural products, from 2018 to now, the domestic sugar industry has been under great pressure when Thai businesses have dumped, smuggled and cheated. Facing the above situation, the Ministry of Industry and Trade has imposed an anti-dumping tax on this item. WOMENIn general, the reduction of 1,706 tariff lines to 0% by 2015 of this agreement will affect the increase of import turnover and the trend of increasing import movement from ASEAN countries compared to other partners, while export turnover does not have many opportunities to increase dramatically under the impact of tariff liberalization because ASEAN 6 countries have completely cut tariffs for Vietnam to 0% since 2010.

In the EU market, in the 2010 period, exports to the EU were estimated at 9.73 billion USD, up 17.8% compared to 2009. This number increased gradually over the years and especially showed signs of a slight decrease in the period 2018 - 2020. This is explained because at this stage, Vietnam has to face a yellow card with our country's seafood industry, as well as the impact of the covid 19 pandemic. In 2020, the EVFTA agreement will come into force with many aspects. Vietnam's exports recorded impressive growth in the EU market (such as iron and steel by 73.9%; cameras, camcorders and components by 260%; machinery and equipment by 82.3%...). Some new products also have high growth to the EU market during this period such as rice, bamboo and rattan products, carpet sedge (increased by over 50%); ceramic and porcelain products (increased by over 25%); a group of vegetables and fruits, electrical wires and cables (increased by more than 15%)...

So, after joining new-generation free trade agreements such as CPTPP, AHKFTA, UKVFTA, EVFTA, Vietnam's export turnover has grown significantly, exports have been significantly higher than in previous years in markets where Vietnam has signed FTAs.

4. RESEARCH METHOD

4.1. Research model

Introduced in the 1960s, the gravity model has gradually become a useful tool for estimating, explaining and evaluating issues related to international trade. In the course of the history of research, gravity models have been developed both theoretically and practically applying very popular estimation. The traditional gravity model can be expressed by the following equation:

$$X_{ij} = \frac{Y_i E_j}{d_{ij}^2}$$

Where X_{ij} represents the volume of trade or labor flow between i and j , Y_i is the total value of manufactured goods of i , E_j is the total demand of country j for goods or labor, and d_{ij} is the geographical distance between two countries i and j .

The more complete of the above model is the structural gravity model. This model has provided a solution to the problem of multilateral trade barriers, and gradually became a popular tool in the analysis, evaluation and policy of trade in the multinational international trade environment. Therefore, in order to assess the impact in a complete way as well as increase the reliability of the estimation results, the research team will use a structural gravity model to assess the impact of FTAs on Vietnam's commodity exports. Specifically, use a model with a linear log form as follows:

$$\ln PX_{VN,j} = \beta_0 + \beta_1 \ln GDP_{jt} + \beta_2 \ln GDP_{VN,t} + \beta_3 \ln(IMP_{VN,j}) + \beta_4 \ln(DIST_{VN,j}) + \beta_5 \text{Contig}_{VN,j,t} + \beta_6 \text{FTA}_{VN,j,t} + \varepsilon_{VN,j,t}$$

In which $PX_{VN,j}$ is the value of the commodity flow from Vietnam to importing country j ; GDP_{VN} and GDP_j are the nominal gross domestic product of Vietnam and the partner country j represents the trade index, $IMP_{VN,j}$ is the value of the flow of goods exchanged to the country importing Vietnam from the country exporting j ; $DIST_{VN,j}$ is the economic center distance between the two countries of Vietnam and j ; $\text{Contig}_{VN,j}$ is a binary variable value that will be equal to 1 if Vietnam and j share the same border and vice versa is zero. These are all common variables and are often used in modeling.

$\text{FTA}_{VN,j}$ is a vector consisting of a set of dummy variables representing a binary variable value that will be equal to 1 if Vietnam and j share a free agreement and vice versa equal to 0. FTAs (15 fake variables including AFTA, ACFTA, AKFTA, AJCEP, VJEP, AIFTA, AANZFTA, VCFTA, VKFTA, VN-EAEU FTA, CPTPP, AHKFTA, EVFTA, RCEP, UKVFTA) have an impact on Vietnam's exports. This is a mandatory key variable in the model because the research paper focuses on the impact of FTAs on Vietnam's commodity exports; e is the natural logarithmic base; ij is assumed to be the standard distribution error term.

4.2. Maximum Likelihood Poisson Pseudo-Maximum Likelihood (PPML) Estimation Method

PPML model was recommended by Silva, Tereyro (2006) where the dependent variable of the gravity model will be transformed into a phi log function. Specifically, the gravity model equation estimated using PPML takes the form:

$$X_{VN,j,t} = \ln GDP_{jt} + \ln GDP_{VN,t} + (1 - \sigma) \ln t_{VN,j,t} - (1 - \sigma) \ln - (1 - \sigma) \ln + \varepsilon_{VN,j,t}$$

Using PPML to estimate commercial data has the following benefits:

Firstly, PPML provides consistent and efficient results when the model has the appearance of price variables that exhibit fixed effects. The above characteristic is of high importance when gravity models based on the theoretical background of trade often must have the appearance of variables that represent the fixed impact of importers and exporters (Shepherd, 2012).

Secondly PPML automatically considers the points of observation when the trade flow is zero, this feature of PPML allows these data to be considered without having to be removed or replaced as in OLS estimation. Thus, allowing commercial data to be estimated without the problem of selection bias.

Thirdly, PPML estimation allows the result to be estimated in the form of elasticity (percentage change), although the independent variable of the PPML-estimated gravity model will be in the non-log function $X_{VNj,t}$, but the results of the gravity model will still be analyzed in the form of elasticity, making it easier to identify the research results.

Finally, PPML estimation solves the problem of variance changes appearing in commercial data.

4.3. Research data

Data used in the model include Vietnam's export and import turnover to 40 countries collected from the World Integrated Trade Solution data source of the World Bank (World Bank) and Trade map, Data on the gross domestic product (GDP) collected from the World Development Indicator database of the World Bank (World Bank). The distance variable between the two countries, DIST is defined as the physical distance from the capital both VN to country j and the data collected from the GeoDist database is calculated and provided by CEPII. The Contig common border variable also has data collected from the GeoDist database calculated and powered by CEPII. Data on trade relations between Vietnam and partner countries through free trade agreements are obtained from the WTO RTA database.

5. ASSESS THE IMPACT OF FTAS ON VIETNAM'S COMMODITY EXPORTS.

5.1. Research results

Lnexp	Robust	
	Coefficient	P-value
Lndist	-0.129	0.000
Lnimp	0.018	0.044
lrgdp1	0.304	0.000
lrgdp2	0.398	0.000
Contig	0.371	0.000
ACFTA	-0.591	0.000
AKFTA	-0.028	0.303
AJCEP	0.767	0.000
VJEPA	-0.927	0.000
AIFTA	-0.187	0.000
AANZFETA	0.055	0.006
VCFTA	0.262	0.000
VKFTA	0.002	0.872
VNEAEUFTA	-0.169	0.005
CPTPP	0.039	0.047
AHKFTA	-0.032	0.303
EVFTA	0.004	0.881
UKVFTA	-0.038	0.026

Table 1: Evaluate impact of factors on Viet Nam's export turnover.

Observing 18 variables which affect Vietnam's export in the 2010 – 2021 period. The research paper divides variables into 4 main groups. The first group includes control variables, namely: Lndist, Lnimp, lrgdp1, lrgdp2, Contig. The second group consists of bilateral free trade agreements which are VJEPA, VCFTA, VKFTA. The third group comprises multilateral free trade agreements ASEAN+, including: AFTA,

ACFTA, AKFTA, AJCEP, AIFTA, AANZFTA. And the last group involves new generation agreements, namely: VNEAEUFTA, CPTPP, AHKFTA, EVFTA, RCEP, UKVFTA.

The study shows that there are 4 variables which are not statistically significant. They are AKFTA, VKFTA, AHKFTA, EVFTA. There are 6 negative variables, including: Indist, ACFTA, VJEP, AIFTA, VNEAEUFTA, UKVFTA and 8 positive variables, namely: lnimp, lrgdp1, lrgdp2, Contig, AJCEP, AANZFTA, VCFTA, CPTPP.

The ASEAN Free Trade Area – AFTA is eliminated because the multicollinearity happens between AFTA and ASEAN+ FTAs. Moreover, RCEP - Regional Comprehensive Economic Partnership Agreement is also excluded from the study due to its entry into force on January 1, 2022 while the study focuses only on the impact of trade agreements on Vietnam's exports in the period 2010 - 2021.

5.2. Discussion

True to the gravity model theory, the variable distance has an inverse effect on Vietnam's exports, implying that means the longer the distance is, the lower the export turnover achieves. Specifically, the distance between Vietnam and partner markets increases by 1 kilometer, Vietnam's exports to that market decrease by -0.13%. According to World Bank data in 2020, the East Asia and Pacific market includes countries such as China, South Korea, and Japan,... accounting for 44.4% - This is the region with the largest export market share of Vietnam while further afield such as Latin America and the Caribbean accounts for 2.86% or the Middle East and North Africa accounts for only 2.34% of Vietnam's export turnover.

Meanwhile, the growth of import turnover positively affects Vietnam's export turnover. When import turnover increases by 1%, export turnover will increase by 0.018% due to Vietnam's outsourcing export structure. According to the Economic Investigation of the General Statistics Office of Vietnam, the whole country has 1740 enterprises carrying out processing goods activities with foreign countries and the export turnover of goods after processing accounts for more than 18% of the total export turnover of goods.

Additionally, Vietnam's total domestic product and the total domestic product of partner countries bring positive impacts on Vietnam's exports in tandem. In detail, Viet Nam's GDP grows 1% leads to 0.31% growth of its own export turnover while the GDP of partner countries increases by 1% sort to the 0.4% increase of Viet Nam's export turnover. These are happened because the augmentation of partner countries' GDP rises foreign purchasing demand while the growth of Viet Nam's GDP strengthens supply capacity. The demand meets supply ability that motivates the increase of Viet Nam's export. When the huge import demand meets the ability to supply large export goods, it will promote each other and directly affect Vietnam's export turnover.

The geographical border between Viet Nam and partner countries promotes Viet Nam's export to this country 1.88 times more than other geographical non – border countries. This is explained by the fact that Vietnam and neighboring countries mainly exchange goods based on road transport, while road infrastructure between countries are well-invested as well as customs clearance is quite convenient. Moreover, Vietnam's partnerships with bordering countries are based almost exclusively on the goals of peace, stability, cooperation and development. Such as the Association of Southeast Asian Nations - ASEAN and the ASEAN Economic Community - AEC, the friendly cooperation between Vietnam and China, the friendship between Vietnam and Laos,....

Through the VCFTA, Vietnam's exports to Chile increased by 0.22%. Chile is committed to a greater degree of openness to Vietnamese goods. Accordingly, 83.54% of the total tariff lines will be eliminated as soon as the Agreement comes into effect, accounting for 81.8% of Vietnam's export turnover to Chile

in 2007, this commitment determines that by 2029, Chile will eliminate most of the flows from Vietnam, accounting for 99.62% of the tariff and equivalent to 100% of Vietnam's export turnover to Chile in 2007. VCFTA is one of the new, comprehensive FTAs, with a highly broad cooperation framework but also very flexible in cases, facilitating bilateral trade. Beside that, Chile is a potential export market for Vietnam and a hinge to expand Vietnam's product exports to the South American market.

Prior to VJEPA, economic relations between the two countries were implemented on the legal basis of the AJCEP signed in 2008. VJEPA was signed to enhance trade exchanges between the two countries based on VJEPA's tariff-free commitments to diversify items, especially Vietnamese exports. Specifically, in the mentioned commitment, Japan will eliminate tariffs for 96.45% of total tariff lines in the Tariff for Vietnamese goods by the end of the roadmap 2026. However, the VJEPA has a negative impact on Vietnam's exports because the duplication of the same trading partner in the two agreements, making it difficult to choose to apply a suitable one. Moreover, Japan is an extreme strict market, goods exported to this market are strictly controlled, so if Vietnamese goods do not meet the requirements, they will be refused import and circulated in the Japanese commodity market.

Before signing VKFTA, Vietnam and South Korea had trade cooperation through the AKFTA. In order to bring into full play the potential of trade and investment exchanges, Vietnam and Korea continue to sign bilateral free trade agreements and officially implement them from 12/2015. Established after 8 years, VKFTA offers more incentives in both the fields of goods, services and investment. However, according to experts at the "Seminar on the application of the Vietnam – Korea Free Trade Agreement", Vietnamese enterprises have not yet taken advantages of incentives to boost exports to the Korean market. Specifically, the proportion of enterprises using C/O to take incentives from VKFTA is only 15%. In addition, it is also impossible to eliminate external factors such as the Covid epidemic, supply chain disruptions,... Therefore, the impact of VKFTA had no meaning to Vietnam's exports in this study.

The ACFTA between ASEAN and China has a negative impact on Vietnam's exports with a coefficient of -0.59. In essence, ACFTA is an old agreement with low quality, rigid regulations on C/O origin for enterprises. In addition, the market between Vietnam and China has many similarities, so although ACFTA has also made changes to make the agreement more comprehensive, the reduction of trade tariffs, the removal of tariff barriers caused Chinese goods to flood into the ASEAN market or more specifically, the Vietnamese market created trade competition between products of Chinese enterprises and Vietnamese enterprises. Currently, China is the largest trading partner but also the market where Vietnam has the biggest trade deficit.

In term of AIFTA, Vietnam's export turnover to India is -0.19%. According to commitments in the agreement, many advantageous export items of Vietnam are on India's sensitive list, which means there is a slow tariff reduction roadmap, such as textiles and garments, footwear, plastic products, machinery, equipment and spare parts. There are some items such as seafood, vegetables, processed foods, textile products, means of transportation... again in the exclusion category, i.e. India has not committed to reducing taxes. In addition, when we open under the Agreement, because our export structure and India have many similarities, there will be many goods, industries or sectors that have to compete with imports, many businesses have to reduce production or dissolve due to incompeteability.

AANZFTA is the most comprehensive free trade agreement that ASEAN has signed with dialogue partners, expanding deeply with the goal of comprehensive integration of 12 economies, so the increasingly diversified products, the expanded cooperation and investment framework has a direct impact on Vietnam's ability to export goods to the Australian market and New Zealand. The multilateral agreement between

Australia, New Zealand and ASEAN is shown on the statistical table with a favorable impact and boosts Vietnam's export turnover to Oceania 2.56 times more than other countries.

Japan is one of Vietnam's most important and long-standing partners. While the VJEPA variable has a negative impact, AJCEP has a positive impact with coefficient of 0.767 because compared to VJEPA, AJCEP has more favorable rules of origin for Vietnamese enterprises to access to the Japanese market and the application of the agreement will be based on export needs to take advantage of tax incentives or take advantage of preferential origin of Business.

The AKFTA agreement has no impact on Vietnam's exports. The reason is the proportion of enterprises taking advantage of incentives from AKFTAs is still very limited, causing the trade balance with export value to increasingly tilt in favor of Korea. In addition, Korea protects domestic goods, in spite of preferential tariffs, Vietnam's exports, especially agricultural products, are very strictly inspected, so exports are limited while agricultural products are one of Vietnam's main export .

Member countries in the Eurasian Economic Union, but Russia, have a very low import turnover from Vietnam, moreover, Vietnamese enterprises have not taken advantages of opportunities as well as made good use of the incentives of the agreement as well as exploited this open market. Therefore, through the VNEAEUFTA, Vietnam's exports decreased by 0.17%.

Meanwhile, the EVFTA and AHKFTA agreements have no significance in this study. The above agreements came into force for a relatively short time, so they did not show a clear impact while the impact of the agreement often lags behind the implementation, so EVFTA and AHKFTA need more time to record export growth of markets. In addition, in recent years, political instability along with policy changes from Beijing have been changing the economic and social development of this special zone. Especially since June 30, 2020, when China applied the National Security Law to Hong Kong. Because Hong Kong's political sensitivities coincide with the agreement's entry into force, it is unlikely to have a tangible impact on Vietnam's exports.

In contrast, it is also a new agreement, which was just active in May 2021 but the UKVFTA has shown its impact with a coefficient of -0.04. The United Kingdom of Great Britain and Northern Ireland is one of Vietnam's most important economic partners, so the opportunity to grow exports of Vietnam's sectors to this market is huge. The UK officially withdrew from the EU in 2020 caused a backlog of trade demand between Vietnam and the UK. The UKVFTA agreement was born and inherited all the principles of EVFTA is an opportunity to promote exchange, especially the export of Vietnamese goods to this market. The active time of the agreement is very short compared to the time limit of the study, so the impact of the agreement represents an adverse impact on Vietnam's exports.

Similarly, CPTPP is a new generation multilateral agreement, signed and took effect in January 2019. CPTPP countries commit to completely eliminate from 97% to 100% of import tariff lines for goods originating from Vietnam, depending on the commitments of each country. With the active participation of many countries in the agreement, detailed commitments to delve into a number of issues such as non-tariff measures, tariff barrier removal, transparency implementation as well as a wide exchange market, high demand and diversity, although it has a relatively short validity period, the CPTPP agreement has recorded a positive impact on Vietnam exports with a coefficient of 0.04.

6. RECOMMENDATIONS TO PROMOTE VIETNAM'S EXPORTS UNDER THE IMPACT OF FREE TRADE AGREEMENTS

6.1. Recommendations to the Government

Firstly, the negative impact of the distance variables and the positive impact of the border common variable proved that the Vietnamese government should continue to actively promote and invest in the

development of road infrastructure and facilities and promote the convenience of customs clearance to promote relations between countries in the same region or countries sharing borders with Vietnam.

Secondly, the government needs to improve the market forecasting capacity to have a close orientation and direction with the actual situation to create coordination between sectors and levels to help prepare well the basic conditions in the country as well as the strategy, methodical, clear when signing FTAs. Strengthen communication for businesses about Vietnam's commitments and the commitments of partners in FTAs to improve and overcome the problem of businesses not understanding the commitments, and requirements or not taking advantage of FTA incentives such as AKFTA, VKFTA, VJEPA,...

Finally, the adverse impact of AIFTA in the research has also shown that Vietnam should make an offer to the two countries to open the market for vegetables, seafood, processed foods...and sign a bilateral free trade agreement between Vietnam and India to facilitate the import and export of agricultural products between the two countries.

6.2. Recommendations to business

Firstly, the estimated results show that the total domestic output of Vietnam and the importing country has a positive effect on Vietnam's goods exports. Therefore, it can be seen that the development of the production capacity of Vietnamese enterprises, promoting the volume of manufactured goods is very necessary. In addition, businesses also need to actively expand export markets, focusing on markets with large GDP. To do this, businesses need to collect information about the requirements of the potential market, as well as about the needs and tastes of consumers in these markets.

Secondly, bilateral free trade agreements such as VJEPA, VCFTA, and VKFTA have different impacts. For VJEPA, this agreement has the opposite effect. The actual benefits from the tariff reduction of the VJEPA are limited, the level of preferential leverage is lower than in other FTAs. However, this is also a comprehensive agreement on trade in goods, services, investment and economic cooperation, so Vietnamese enterprises should actively promote the export to Japan of goods that Vietnam has advantages and enjoys many incentives in the VJEPA Agreement. For VCFTA, this agreement has a positive impact on Vietnam's exports. In 2021, Vietnam will continue to be ASEAN's top exporter to the Chilean market and Chile's fifth largest trading partner in Asia, after China, Japan, South Korea and India. It can be assessed that this market is very open and Vietnamese enterprises must try to increase exports to this market based on meeting the requirements of Chilean products. Particularly for the VKFTA agreement, the results show that this agreement is not significant in research because the application of incentives is very limited and Vietnamese enterprises have not yet grasped the opportunity to apply the agreement while VKFTA is more expanded in the field of goods and services and investment than the AKFTA agreement established 8 years ago. Enterprises need to be more proactive in understanding information as well as mastering the rules of origin of this agreement.

Thirdly is the ASEAN+ agreements including ACFTA, AKFTA, AJCEP, AIFTA, AANZFTA. Contrary to the negative impact of VJEPA as mentioned above, AJCEP has a positive impact on Vietnam's commodity exports. This shows that Vietnamese enterprises should use more than AJCEP, apply preferential treatment under AJCEP lower than the VJEPA tax rate at the time of export or if using inputs from ASEAN countries to produce exported goods with origin following the AJCEP Agreement. Similarly, AANZFTA also gives positive results. However, these are difficult markets and require very high quality, so businesses need to continue to focus on diversifying goods, proactively sourcing raw materials, improve the quality and competitiveness of products to make the best use of this agreement. Of all the ASEAN+ agreements, only

the AKFTA agreement is not significant in this research. Although this agreement opens a smaller number of items than VKFTA, it has a C/O rule of origin with a higher percentage of VKFTA users and businesses are familiar with the rules in this agreement, but AKFTA is narrower and less expanded than VKFTA. Vietnamese enterprises should know how to use flexibly, choose to meet the criteria to be granted C/O in the form of AK or VK and improve the problem of applying limited incentives to imbalance the trade balance with the export value increasingly tilted towards Korea. In contrast to the above agreements, ACFTA and AIFTA have the opposite impact on Vietnamese exports. Like previous agreements, it is not only necessary for state policies but also for Vietnamese enterprises to grasp and better understand these two markets.

Finally, there are the new generation agreements. For example, China is no longer a pleasant market for agricultural exports and the ACFTA agreement has a negative impact as analyzed above, but with the signing of the Regional Comprehensive Partnership Agreement (RCEP) or the promotion of participation in the CPTPP agreement, it is expected that these agreements will facilitate economic cooperation between the two countries, besides, businesses need to have a clear and complete plan for goods to China, focusing on the types of products that China is in great demand from Vietnam such as tropical agricultural products, seafood... and at the same time carefully learn about changes in the quality regulations of the local market, diversify the main export channel to improve the efficiency of orders. Next, in order to take advantage of opportunities and increase exports, Vietnamese enterprises themselves need to make efforts to innovate themselves, proactively control and improve product quality combined with promoting sustainable economic development, a green economy to create conditions to meet standards, technical regulations or non-tariff barriers from the fastidious market - EU. This is because although the EVFTA is not significant in research due to its short validity period when looking at the scope of commitments (EVFTA not only refers to direct trade, but also to environmental, intellectual property, labor, trade and sustainable development, cooperation and capacity building issues), it can easily be seen that, besides opportunities, EVFTA brings many challenges. And Vietnamese businesses are facing difficulties when there are too many problems along with no experience in implementing the required agreements.

7. CONCLUSION

Based on the gravity model and PPML estimation, the authors calculate and collect relevant data. In order to assess the impact of Free Trade Agreements (FTAs) on Vietnam's exports, the collected dataset includes data related to trade relations between Vietnam and 40 partner countries over a period of time. The period from 2010 to 2021. The research has solved the following issues: System and clarify basic theoretical issues about Free Trade Agreements FTAs as well as factors affecting the export of Vietnam. these Agreements, as well as a theoretical analysis of the model used in this research. Analyzing the current situation of Vietnam's exports by industry and by market in the 2010-2021 period, we see that the export market is expanding, not only increasing in traditional markets but also exploiting new markets. potential and make effective use of FTAs. The findings of the research show that: AANZFTA, VCFTA, and CPTPP are shown on the statistical table with a positive effect, showing a positive impact on Vietnam's export turnover. ACFTA, AIFTA, UKVFTA negative effect on exports. Vietnam, when joining this agreement, exported less to the partner country. Particularly, the free trade agreement between ASEAN - Japan has a positive impact on Vietnam's exports, in contrast to the influence of this agreement, the VJEPA agreement with the participation of Vietnam and Japan has a positive effect on Vietnam's exports. reverse motion. Agreement VNEAEUFTA facilitates exchanges between countries, but in fact, it has a negative impact on Vietnam's export turnover. Agreements such as AKFTA, VKFTA, EVFTA, AHKFTA are not meaningful in this research. Finally, on that basis, the research offers solutions for the Government and businesses based

on the important policy implications of the variables to improve and enhance the effectiveness of free trade agreements. to Vietnamese exports.

RESEARCH ON FACTORS AFFECTING VIETNAM'S FRUIT AND VEGETABLE EXPORTS TO THE EU MARKET

Author: Nguyen Thi Linh Chi¹, Nguyen Van Du, Le Thi Que, Duong Thi Phuong Thao
Mentor: MSc. Truong Quang Minh

ABSTRACT: This study adopted a mixed-methods-based approach that is qualitative and quantitative research to analyze the factors influencing the export of fruits and vegetables from Vietnam to the EU market and their impact in the period of 5 years from 2017 to 2021. Through in-depth interviews with experts and processing data collected from 157 businesses, the results show that: Vietnam's fruits and vegetables exports to the EU market have been influenced by 5 factors. All 5 factors have a positive impact on export results and are in descending order of impact: (1) Characteristics of the EU market, (2) Export marketing strategy, (3) Characteristics of exporting business, (4) Characteristics of Vietnam's macro-environment and (5) Competitors. Based on these results, the study proposes some recommendations for both the Vietnamese government and exporters to boost the efficiency of the export of Vietnam's fruits and vegetables to the EU market.

Keywords: EU, export of fruit and vegetable, Vietnam.

1. INTRODUCTION

The export of agricultural products in general and the export of fruits and vegetables in particular is an important economic activity that affects many actors in the economy: farmers, vegetable and fruit exporters, intermediaries, and the economy. According to Balassa (1985), the export of agricultural products plays a very important role, such as: making an important contribution to a country's economic growth and development; creating more jobs and increasing incomes for workers; contributing to the improvement of the state's economic policy and management mechanism in accordance with international laws and practices;... Based on the advantages and potentials of geographical location, land, labor, climate and other ecological conditions, Vietnam can develop a sustainable, multi-industry ecological agriculture with a wide range of agricultural products and great export economic value. In particular, fruits and vegetables are one of the important commodities in Vietnam's agricultural industry, which has grown rapidly in export turnover over the years. The export value of Vietnam's vegetables and fruits has increased from 2.86 billion USD to 3.34 billion USD in the period 2012-2022. In the region, Vietnam is the third largest exporter of vegetables and fruits after the Philippines and Thailand, and Vietnam's fruit and vegetable products have been exported to many countries and territories (Agro Processing and Market Development Authority, 2019).

The EU is a very large fruit and vegetable import market, accounting for 45-50% of the fruit and vegetable volume world imports. Currently, the EU is Vietnam's 4th-largest fruit and vegetable export market. Vietnam's fruit and vegetable exports to the EU continuous growth in the period 2017 - 2021, with an average increase of 5% - 22% per year. Especially, the effect of the EU-Vietnam Free Trade Agreement (EVFTA) has brought great opportunities for Vietnam's fruit and vegetable. Accordingly, the EU is committed to opening up very strongly for Vietnamese fruits and vegetables: 94% of the total 547 tax lines on vegetables and fruit and vegetable products will be eliminated as soon as the Agreement comes into effect. The EVFTA also removes a number of trade barriers for Vietnam and helps Vietnam meet

¹ Thuongmai University.

international standards within the legal framework, environmental regulations and investment requirements. These incentives are considered to create a great advantage in prices for Vietnamese fruit and vegetable (especially in the competition for importing into the EU with countries that have strengths in vegetables and fruits that have not yet had an FTA with the EU such as China, Thailand, Malaysia, ...). However, the total value of Vietnamese fruit and vegetable exports to the EU only accounts for 0.15% (2017) and 0.22% (2021) of the total import turnover of vegetables and fruits in this market. This proportion shows that Vietnam's fruit and vegetable export turnover to the EU is low compared to Vietnam's export potential as well as the EU's import demand.

In previous studies, the competitiveness and efficiency of exporting agricultural products were often affected by a number of factors such as: characteristics of the foreign market (Lam Thanh Ha, 2021; Lina Cui, 2010), characteristics of the domestic market (Dinh Cao Khue, 2021), competitors (Pham Ngoc Y, 2019);... At the same time, the research team noted that there are still quite a few specific studies on the export activities of Vietnamese fruit and vegetable exporters to the EU in a systematic way as well as research works on the factors affecting the export of fruits and vegetables from Vietnam to the EU. Moreover, those studies mainly use the gravity model and there are not many studies using the enterprise survey method. This research approach to the direct survey of enterprises not only meets the research objectives but also can prove to be realistic and topical.

Thus, with the development potential of Vietnam's fruit and vegetable export sector, the export prospects when the EU-Vietnam Agreement (EVFTA) comes into effect and the number of relevant studies is not many, these show the urgency of the research problem. In-depth research and sufficient assessment of the factors affecting Vietnam's fruit and vegetable exports to the EU market will contribute to supplementing the research theoretical framework, and the research results can be used as a source of information valuable reference for policymakers, researchers, and Vietnamese fruit and vegetable exporters.

2. THEORETICAL FRAMEWORK

2.1. Literature review

Export performance is defined as the exporting result of a firm, or the extent to which the firm achieves its goals in exporting products to foreign markets (Ngo Thi Ngoc Huyen & Nguyen Viet Bang, 2020). Export performance is influenced by internal and external factors, corresponding to two theoretical approaches that underlie most research on export activity, namely: theoretical Resource Based View - RBV by Grant (1991) and industrial organization theory - IO by Michael Porter (1980).

The research based on the two theories RBV and IO is increasing. However, each research paper only mentions certain factors in each specific case. After an overview of related topics, the authors found that the factors affecting export activities may include: characteristics of the import market (Ngo Thi Ngoc Huyen & Nguyen Viet Bang, 2020); Pham Ngoc Y, 2019; Lam Thanh Ha, 2021; Lina Cui, 2010; Dinh Cao Khue, 2021; Pham Hoang Linh et al., 2019; Cemal Atici and Bulent Guloglu, 2014), characteristics of the domestic market (Ngo Thi Ngoc Huyen & Nguyen Viet Bang, 2020; Nguyen Thi Duong, 2012; Nguyen Quynh Hoa & Dinh Cong Hoang, 2020; Dinh Cao Khue, 2021; Puspitasari et al., 2021), characteristics of the business (Dinh Cao Khue, 2021; Lam Thanh Ha, 2021; Cao Minh Tri & Nguyen Luu Ly Na, 2018), export marketing strategies (Dinh Cao Khue, 2021; Lam Thanh Ha, 2021; Cao Minh Tri & Nguyen Luu Ly Na, 2018; Ghafoor et al., 2010) and characteristics of competitors (Nguyen Thi Duong, 2012; Pham Ngoc Y, 2019).

2.2 Hypothesis and research model

2.2.1. Characteristics of the EU market

The characteristics of the import market are commonly understood to mean threats and opportunities from this market for exporting commodities into it. Most of the studies highly appreciate and recognize that the characteristics of the importing country's market have a great influence on the export of agricultural products. According to Ngo Thi Ngoc Huyen and Nguyen Viet Bang (2020), the importance of foreign market characteristics is confirmed and assessed as having the greatest influence and impact on export activities. Affirming that in the condition that exporting enterprises are mostly small and medium-sized, and their ability to adapt to the global supply chain is still limited, a thorough study of the export market is one of the two urgent issues compared to the export market's remaining problems. When there exists a difference between the domestic environment and the export market, such as cultural, economic, geographical, and political differences, the greater the difference, the lower the export results of enterprises (Pham Ngoc Y, 2019). In this study, consumption market demand, consumer tastes (indigenous resident preferences), EU domestic production capacity, exchange rate, the population of the import market, and Geographical distance are considered to be the characteristics of the import market to where Vietnamese enterprises will export vegetables and fruits. Therefore, hypothesis 1 is built as follows:

H1: The characteristics of the EU market have a positive impact on Vietnam's fruit and vegetable exports to the EU market (+).

2.2.2. Characteristics of Vietnam's macro-environment

A macro-environment refers to the set of conditions that exist in the economy as a whole, which can affect the business's operations. When exporting enterprises have a close relationship with raw material suppliers, the support of the government, export associations, the environment can be favorable for export, the law for export activities Transparency will stimulate an increase in export (Ngo Thi Ngoc Huyen and Nguyen Viet Bang, 2020). National factors include factors on natural conditions for agricultural production, government mechanisms and policies, factors on the development of science and technology to production, preservation and transportation of agricultural products. is a factor affecting the production and export of agricultural products (Nguyen Thi Duong, 2012). Therefore, this study expects the export infrastructure, the cooperation of the management agencies to help businesses access export policies, the potential and advantages of developing fruit and vegetable production in Vietnam, the openness of the economy or the international economic integration and the scale of cultivation according to GlobalGap standards in Vietnam affects the research results. Hypothesis 2 is built as follows:

H2: Characteristics of Vietnam's macro-environment have a positive impact on Vietnam's export results to the EU market (+).

2.2.3. Characteristics of the exporting business

The characteristics of a business can be defined as the state of resources within it. Good resources and capability will provide exporting businesses with numerous opportunities to access and fulfill the demands of the import market (Dinh Cao Khue, 2021). In the context of strong trade liberalization today, businesses that want to maintain and develop export markets for goods in general and agricultural products in particular must have their own export strategy, including clear plans, specifically, which comes with risk tolerance and control ability (Ibeh, 2003). The ability of firms to export can also be expressed in terms of firm size (Beleska, 2014; Akyol & Akehurst, 2003; Constantine, 1996). Many studies have confirmed that

firm characteristics are correlated with export performance (Monteiro et al., 2019). In this study, the size and quality of capital, the size, and quality of labor, the ability to apply science and technology, export experience, image, and reputation of the enterprise are considered as the characteristics of the enterprise export. Hypothesis 3 is built as follows:

H3: Characteristics of the exporting business have a positive impact on Vietnam's export results to the EU market (+).

2.2.4. Export marketing strategy

The formula for how a business will compete, what are the goals and what policies will be needed to realize these goals are known as the marketing strategy. Export marketing strategy refers to the way in which companies respond to import market conditions by carrying out mixed marketing campaigns, including product, price, promotion, and distribution in international marketing field (Ngo Thi Ngoc Huyen & Nguyen Viet Bang, 2020). Export marketing strategy is also one of the factors affecting the export activities of agricultural products of enterprises. Tailoring marketing strategies to the requirements of foreign markets allows companies to satisfy customer requirements in export markets (Haddoud et al., 2018). In addition, studies by several authors show that firms' marketing strategies influence export performance (Cavusgil and Zou, 1994; Chen et al., 2016). In this study, enterprises participating in trade promotion fairs to promote their products, organize price-competitive promotional activities and use many different distribution channels to export or research trends in the market. The market's consumption of vegetables and fruits will be the characteristics of the export marketing strategy of Vietnamese enterprises exporting vegetables and fruits to the EU. Hypothesis 4 is built as follows:

H4: Export marketing strategy has a positive impact on Vietnam's fruit and vegetable exports to the EU market (+).

2.2.5. Competitors

Competitors are also one of the factors affecting the export of goods in general and agricultural products in particular. Competitors in this article are interpreted as countries that export similar or substituted Vietnamese fruit and vegetable products in the EU market. In the export market, exporters face competition not only for the product itself but also for various substitute products from both the domestic market and other exporting countries. The degree of competition in the export market can be expressed through the number and size of suppliers, prices, and non-price factors such as quality, product diversification, advertising, and reposting. In this article, competitor scores such as acceptance of sustainable competitors in products, frequency of competitor-specific new product introductions, sustainability-based competition industry sustainability, competitor supply capacity and price competition against competitor industry sustainable products are believed to have an impact on Vietnam's fruit and vegetable exports to the EU. Hypothesis 5 is built as follows:

H5: Competitors have a favorable impact on Vietnam's fruit and vegetable export results to the EU market (+).

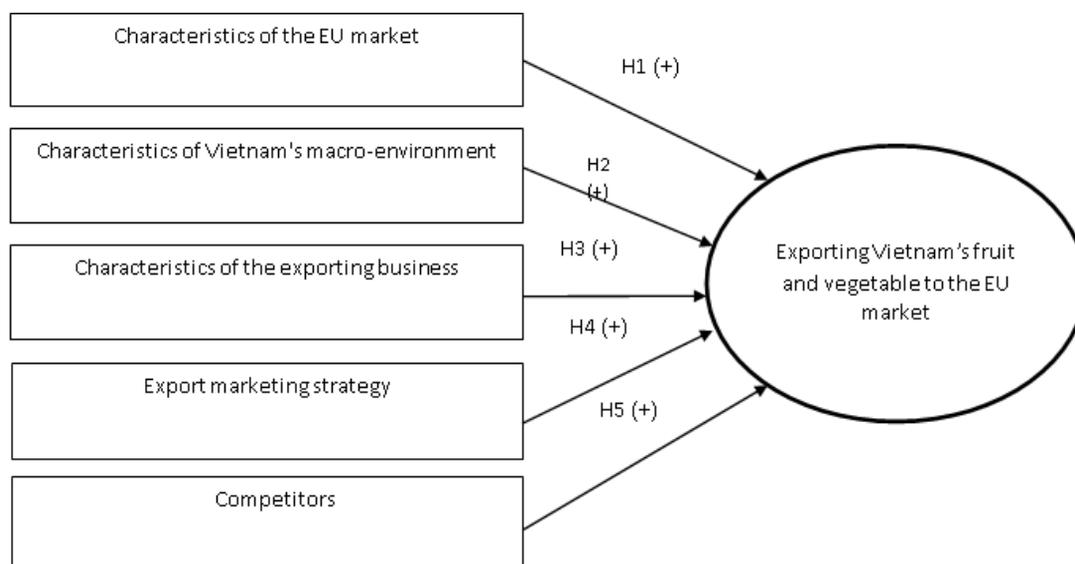

Figure 1. Expected research model

Source: Proposed by the authors

The variables in the research model are measured by the Likert scale with a scale from 1 to 5. The scale used to measure specific variables is as follows:

Table 1. The scale of the research

Factor	Code	Item	Reference
Characteristics of the EU market (F_NN)	NN1	EU consumers prefer tropical fruit and vegetable products	Ngo Thi Ngoc Huyen and Nguyen Viet Bang (2020); Pham Ngoc Y (2019); Lam Thanh Ha (2021); Lina Cui (2010); Dinh Cao Khue (2021)
	NN2	The EU's domestic production capacity of fruit and vegetables has not yet met the EU market demand	
	NN3	The rising exchange rate benefits Vietnam's exports	
	NN4	The large population of the EU creates a large market demand for exports	
	NN5	The geographical distance between Vietnam and the EU is convenient for exporting goods	
Characteristics of Vietnam's macro-environment (F_TN)	TN1	Export infrastructure (roads, factories, processing technology, ...) developed in favor of enterprises' exports	Ngo Thi Ngoc Huyen and Nguyen Viet Bang (2020), Dinh Cao Khue (2021)
	TN2	The effective coordination of management agencies helps businesses to access and understand export policies	
	TN3	Businesses receive more incentives when Vietnam actively integrates into the international economy by signing many bilateral and multilateral trade agreements and participating in international organizations, etc.	
	TN4	The growing scale of cultivation according to GlobalGap standards is a favorable condition for Vietnamese enterprises to export	
	TN5	The potential and advantages of developing fruit and vegetable production in Vietnam create favorable conditions for enterprises to export	
Characteristics of the exporting business (F_DN)	DN1	My business is able to mobilize and manage capital for export activities	Dinh Cao Khue (2021), Lam Thanh Ha (2021), Cao Minh Tri and Nguyen Luu Ly Na (2018)
	DN2	The workforce of my company has knowledge and experience in exporting vegetables and fruits to the EU	
	DN3	My business is equipped with technology for processing and exporting vegetables and fruits	
	DN4	My business has foreign investment capital	
	DN5	The image of my business has a reputation to enhance its position in the fruit and vegetable export market	

Export marketing strategy (F_CL)	CL1	My business regularly participates in trade promotion fairs to promote products and find strategic partners	Dinh Cao Khue (2021), Lam Thanh Ha (2021), Cao Minh Tri and Nguyen Luu Ly Na (2018)
	CL2	My business studies the EU markets fruit and vegetable consumption trends to create the best product adaptation	
	CL3	My business uses many different distribution channels to export the results to the EU market	
	CL4	My business regularly organizes promotional activities and competes on prices for exported vegetables and fruits	
Competitors (F_CT)	CT1	The increased intensity of competition will positively affect the adaptability of businesses and thereby increase their export results	Pham Ngoc Y (2019)
	CT2	The frequency of new product introductions creates motivation for my businesses to improve their products	
	CT3	My business improves the supply ability to compete with competitors' supply	
	CT4	The level that competitors adopt sustainable competition is high, which motivates my business to develop a strategy on Sustainable competition in this field	
	CT5	My business seeks to improve export prices to compete with other competitors' prices	
Exporting Vietnam's fruit and vegetable to the EU market (F_KQ)	KQ1	My business's profit from exporting to the EU has increased steadily	Pham Ngoc Y (2019), Lam Thanh Ha (2021), Cao Minh Tri and Nguyen Luu Ly Na (2018).
	KQ2	My business's export of vegetables and fruits to the EU has grown well	
	KQ3	My business is satisfied with the revenue from exporting vegetables to the EU market	

Source: Compiled by the author from research overview

3. RESEARCH METHOD

3.1 Data processing

The article uses mixed research methods: combining qualitative and quantitative research. The results obtained from the interviews help the research team to build the research model, hypotheses, and at the same time complete the survey form. Specifically, the research team built a semi-structured questionnaire to interview experts about the importance of factors affecting the efficiency of Vietnam's fruit and vegetable exports to the EU market. The interviews were conducted for the purpose of gaining deep insight into the current state of production, processing, logistics, and export of Vietnam's fruit and vegetable industry. The authors used the purposive sampling technique for the identification and selection of experts who would be able to demonstrate a wealth of experiences and profound understanding regarding of the research topic. There were 4 experts representing businesses, the Association of Fruits and Vegetables and the University of Economics participated in the interviews. The decision to select interviewees in this study is based on the research questions and relevant theoretical perspectives that informing our study. The average time of each interviews was two hours and taken place at the interviewee's offices. They provide valuable information about opportunities, challenges, market trends, and consumer preferences in both domestic and international markets. The answers were compared with results from previous studies done by domestic and foreign scholars, thereby helping the research team to more accurately identify the group of factors that are likely to affect the effectiveness of the study of fruit and vegetable export.

Then, the authors used a quantitative method. The results obtained from the previous qualitative interviews were used to build research models and hypotheses, and simultaneously to complete the survey

form. The survey questionnaire was sent on a large scale to Vietnamese enterprises that are exporting fruit and vegetable to the EU market. The list of survey samples was collected from the list of “Reputable exporters” published by the Ministry of Industry and Trade over the years, “Export information to the EU market - vegetables and fruits” by European - American market department (Ministry of Industry and Trade), list of members of Vietnam Fruit and Vegetable Association and from other personal relationships of the author. The number of samples is 157, which satisfies the condition that it is more than 5 times the number of observed variables.

3.2. Data collection

Secondary data is collected from direct sources (books, dissertations, research works stored in the National Library, the Library of the Thuongmai University, and the Library of the Hanoi Law University) and other online sources (websites of the General Statistics Office, General Department of Customs, UN Comtrade, Trademap, Eurostat, ...)

Primary data is collected by surveying enterprises in Vietnam that have export activities to the EU. The questionnaire was created on Google Form and sent to the selected firms from September 2022 to October 2022. The survey by questionnaire collected 157 valid survey sheets. Primary data were processed using SPSS 20 software.

4. RESULTS AND DISCUSSION

4.1. Results

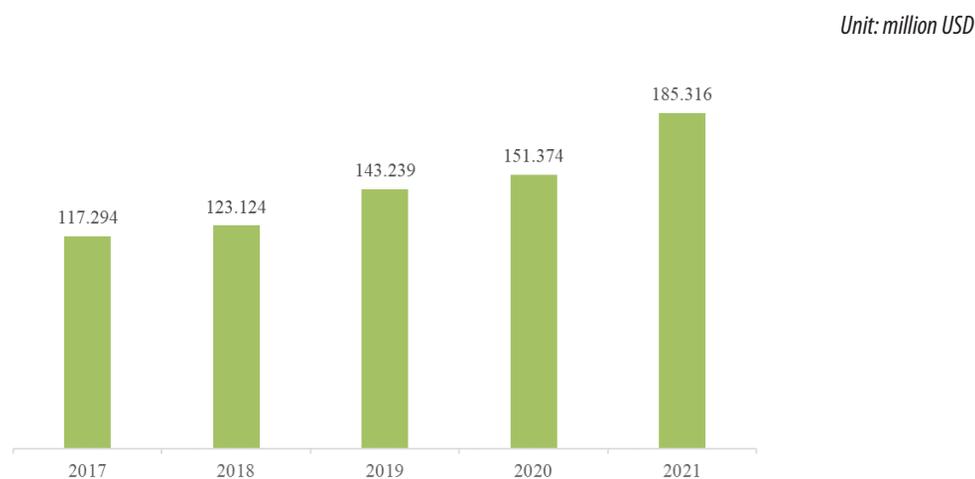

4.1.1. Actual situation of Vietnam’s fruit and vegetable exports to the EU market

4.1.1.1 Export turnover

EU is an extremely large fruit and vegetable import market, accounting for 45% to 50% of the world’s imported fruits and vegetables. Currently, the EU is Vietnam’s fourth largest fruit and vegetable export market. However, Vietnam’s vegetables and fruits exported to the EU are still mainly fresh and preliminarily processed products. The products that have been deeply processed are very few, so the added value is not high.

According to statistics from UN Comtrade, Vietnam’s fruit and vegetable exports to the EU achieved an average growth rate of 12.35% per year in the period 5 years from 2017 to 2021.

Figure 2. Fruit and vegetable export turnover of Vietnam to the EU market

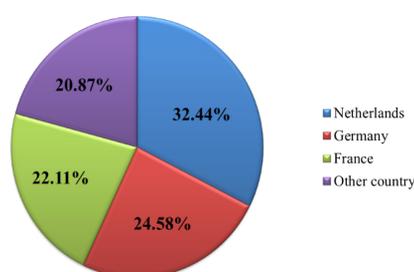

Source: Compiled and analyzed by the author

According to statistics of UN Comtrade, Vietnam's fruit and vegetable exports to the EU increased steadily in the period of five years from 2017 to 2021, averaging 5% to 22%. In 2017, Vietnam's vegetables and fruits exported to the EU reached 117.294 million USD, following by 2021 this figure has peaked at 185.316 million USD.

Vietnam's vegetables and fruits have been present in almost all EU member countries, of which the Netherlands, Germany, and France are the three largest export markets in the bloc, accounting for 32.44%, 24.58% and 22.11% respectively in 2021.

Figure 3. Structure of Vietnam's fruit and vegetable export market in the EU in 2021
(% by value of turnover)

Source: Compiled and analyzed by the author

4.1.1.2 Exported products

Table 2. Structure of vegetables and fruits exported from Vietnam to the EU by HS code

Unit: million USD

HS code	2017	2018	2019	2020	2021
HS 07 (Edible vegetables, certain roots and tubers)	15.041	12.852	15.172	14.700	16.987
HS 08 (Edible fruit and nuts; peel of citrus fruit or melons)	56.126	65.696	71.491	71.769	98.100
HS 20 (Preparations of vegetables, fruit, nuts or other parts of plants)	46.126	44.574	56.574	64.903	70.227

Source: Compiled and analyzed by the author

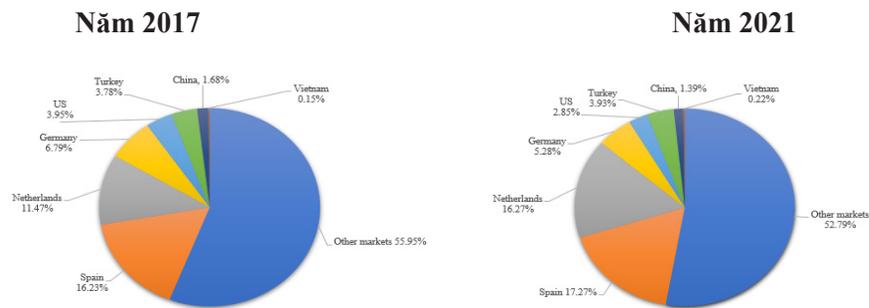

According to UN Comtrade, in 2021, Vietnam's fruit and vegetable exports to the EU market increased for all three groups of fruits and nuts; processed products and vegetables, in which processed products (HS code 20) raised the most by 5.3 million USD compared to 2020.

Export turnover of fruits and nuts from Vietnam to the EU in 2021 reached \$98 million, up 36.82% compared to 2020, accounting for 52.9% of the total export turnover of vegetables and fruits to the EU. In which, Vietnam increased exports of coconut, date, fig, pineapple, avocado, guava, mango and mangosteen products. In contrast, some items in the group of fruits and nuts exported to the EU decreased, such as dried apricots, prunes, apples, peaches, pears, papayas, tamarinds, pears.

For vegetables and fruits, export turnover to the EU in 2021 will reach 16.99 million USD, an increase of 15.58% compared to 2020. Vietnam focuses on exporting to the EU products such as corn, straw mushrooms, lemongrass, sweet potato, taro, chili, ...

4.1.1.3 Export market share

Figure 4. Market share of fruit and vegetable supplies in the EU (% by value)

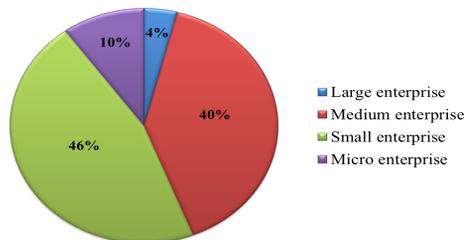

Source: Compiled and analyzed by the author

According to calculations from UN Comtrade data, Vietnam is one of the few markets where the EU recorded a high average growth rate of fruit and vegetable imports in the 2017-2021 period: 13.1%/year, from 117 million USD in 2017 to 185 million USD in 2021. The market share of Vietnam’s fruit and vegetable products in the total import value of the EU accounted for 0.15% in 2017, increasing to 0.22% in 2021. Although the value of EU imports of this item from Vietnam is still much lower than that of many other domestic and foreign markets, the high growth rate of imports shows that the fruit and vegetable industry in Vietnam is gradually meeting the EU’s consumption conditions and tastes.

4.1.2. The results of the analysis of influencing factors / Research results

4.1.2.1 Descriptive statistics

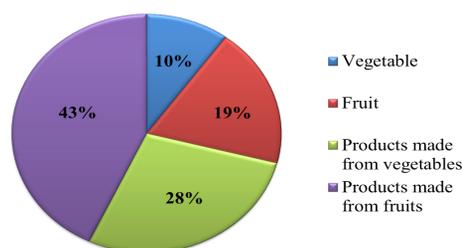

Figure 5. Statistics on the size of enterprises participating in the survey

Source: Data surveyed from enterprises

The results in 157 enterprises exporting fruits and vegetables to the EU market showed that there was a difference in the size of the enterprises: 46% of small enterprises participated in the survey, 40% of medium enterprises, 10% of micro enterprises and only 4% of large enterprises in detail.

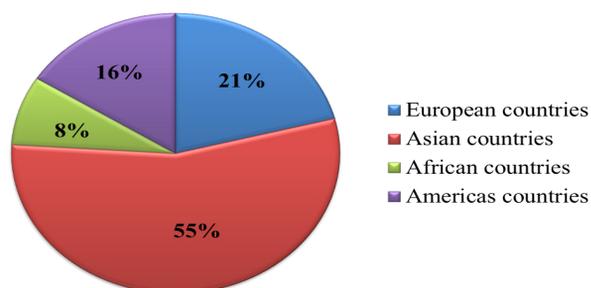

Figure 6. Proportion of the key export fruit and vegetable products to the EU market

Source: Data surveyed from enterprises

The majority of enterprises surveyed export processed fruit products (43%) and processed vegetable products (28%). Meanwhile, unprocessed vegetables and fruits are 10% and 18%, respectively.

Figure 7. Main competitors of Vietnamese fruit and vegetable exporters in the EU market

Source: Data surveyed from enterprises

Asia businesses were considered as the main competitors, accounting for 55%, following by Europe businesses (21%), Americas businesses (16%), and finally Africa businesses (8%).

4.1.2.2. Factors influencing to the export of fruits and vegetables from Vietnam to the EU market

a. Check the reliability of the scale

Table 3. Cronbach's Alpha accreditation results

Factors	Number of observed variables	Cronbach's Alpha	Smallest Correlation coefficient
Characteristics of the EU market (F_NN)	4	0.782	0.528
Characteristics of Vietnam's macro-environment (F_TN)	4	0.818	0.592
Characteristics of the exporting business (F_DN)	4	0.844	0.633
Export marketing strategy (F_CL)	3	0.8	0.618
Competitors (F_CT)	4	0.807	0.535
Exporting Vietnam's fruit and vegetable to the EU market (F_KQ)	3	0.858	0.705

Source: Data analyzed by SPSS 20

b. EFA discovery factor analysis results

Table 4. Rotated Component Matrix

Item	Component				
	1	2	3	4	5
DN2	.825				
DN3	.803				
DN5	.790				
DN1	.749				
TN1		.824			
TN3		.814			
TN2		.807			
TN4		.761			
CT2			.790		
CT1			.786		
CT5			.776		
CT3			.678		
NN1				.846	
NN3				.750	

NN4				.715	
NN2				.655	
CL2					.838
CL3					.827
CL1					.740

Source: Data analyzed by SPSS 20

The above matrix ensures the conditions of convergence value and discriminant value. No variable loads in both factors and no variable has no load factor, most of the load factor is greater than 0.5 so the research model remains the same.

c. Pearson’s correlation analysis

Table 5. Pearson correlation

		Correlations					
		F_NN	F_DN	F_CT	F_CL	F_TN	F_KQ
F_NN	Pearson Correlation	1	.250**	.476**	-.005	.025	.599**
	Sig. (2-tailed)		.002	.000	.947	.756	.000
	N	157	157	157	157	157	157
F_DN	Pearson Correlation	.250**	1	.215**	-.488**	.078	.313**
	Sig. (2-tailed)	.002		.007	.000	.334	.000
	N	157	157	157	157	157	157
F_CT	Pearson Correlation	.476**	.215**	1	.062	.183*	.518**
	Sig. (2-tailed)	.000	.007		.437	.022	.000
	N	157	157	157	157	157	157
F_CL	Pearson Correlation	-.005	-.488**	.062	1	-.007	.185*
	Sig. (2-tailed)	.947	.000	.437		.928	.021
	N	157	157	157	157	157	157
F_TN	Pearson Correlation	.025	.078	.183*	-.007	1	.355**
	Sig. (2-tailed)	.756	.334	.022	.928		.000
	N	157	157	157	157	157	157
F_KQ	Pearson Correlation	.599**	.313**	.518**	.185*	.355**	1
	Sig. (2-tailed)	.000	.000	.000	.021	.000	
	N	157	157	157	157	157	157
		**. Correlation is significant at the 0.01 level (2-tailed).					
		*. Correlation is significant at the 0.05 level (2-tailed).					

Source: Data analyzed by SPSS 20

The linear correlation between the independent variable and the dependent variable: All independent variables have sig. < 0.05 and $0 \leq r \leq 1$. This shows that the independent variables have a linear correlation with the dependent variable F_KQ with the degree of correlation through determination on r.

Linear correlation between independent variables: Most of the research expect sig. correlation between independent variables is greater than 0.05 or if sig is less than 0.05 then r is low. The results of running SPSS of the group found that the above conditions were satisfied. At the same time, no case of sig

was recorded. < 0.05 and Pearson correlation value > 0.7 , so there is little possibility of multicollinearity (Carsten F. Dormann et al., 2013).

d. Multivariable regression analysis

Table 6. Multivariable regression analysis results

Model	Unstandardized Coefficients	Standardized Coefficients	Collinearity Statistics	
	B	Beta	Sig.	VIF
Constant	-2.716		.000	
Characteristics of the EU market (F_NN)	.515	.435	.000	1.345
Characteristics of the exporting business (F_DN)	.354	.304	.000	1.474
Competitors (F_CT)	.196	.172	.005	1.388
Export marketing strategy (F_CL)	.412	.326	.000	1.369
Characteristics of Vietnam's macro-environment (F_TN)	.228	.291	.000	1.043
Sig value. F (Anova)	0.000			
Adjust R Square	59.5%			

Source: Data analyzed by SPSS 20

After analyzing the regression results, the model has an adjusted R² coefficient of 59.5% or the influence of the independent variable explains 59.5% of the variation of the dependent variable in the regression model.

The equation showing the results of Vietnam's fruit and vegetable exports to the EU market according to independent variables is as follows:

$$F_{KQ} = 0.435 * F_{NN} + 0.326 * F_{CL} + 0.304 * F_{DN} + 0.291 * F_{TN} + 0.172 * F_{CT} + e$$

4.2. Discussion

Among the factors affecting the export of fruits and vegetables to the EU market, the independent variable F_NN "Characteristics of the EU market" has the highest impact ($\beta = 0.435$), followed by F_CL "Export marketing strategy" exports" ($\beta = 0.326$), F_DN "Characteristics of the exporting business" ($\beta = 0.304$), F_TN "Characteristics of Vietnam's macro-environment" ($\beta = 0.291$), F_CT "Competitors" ($\beta = 0.172$). Beta coefficients are all positive, so these independent variables all have a positive effect on the dependent variable.

This shows that in the context and conditions in Vietnam, the findings in our study are similar to the research results of Ngo Thi Ngoc Huyen and Nguyen Viet Bang (2020), Lina Cui (2010), Dinh Cao Khue (2021) on characteristics of the foreign market; Ngo Thi Ngoc Huyen and Nguyen Viet Bang (2020), Dinh Cao Khue (2021) on characteristics of the domestic market; Dinh Cao Khue (2021), Lam Thanh Ha (2021), Cao Minh Tri and Nguyen Luu Ly Na (2018) on characteristics of the exporting business; Dinh Cao Khue (2021), Lam Thanh Ha (2021), Cao Minh Tri and Nguyen Luu Ly Na (2018) on export marketing strategy; Pham Ngoc Y (2019) on competitors.

From the analysis above, the author put forward recommendations to boost the efficiency of Vietnam's fruit and vegetable exports to the EU market:

4.2.1. For exporters

- (1) Invest in development and application of technology for production lines

Enterprises need to actively invest and apply production lines, continuously innovate technology to have high quality products to meet import standards into the EU market. In addition, it is necessary to apply closed technology right from the selection of varieties, planting, harvesting, production and to storage and transportation.

(2) Establish a sustainable competitive strategy for enterprises

Before products are imported into the EU, they must be irradiated and processed to ensure quality. All these implementation costs are borne by Vietnamese enterprises, thus increasing export prices, making it difficult to compete with similar exporting countries in the region. Therefore, businesses need to find ways to overcome this situation by building a competitive strategy on sustainable prices. Besides, enterprises need to combine with other strategies such as: applying science and technology to increase the rate and value of exported products; invest in preservation technology to reduce product loss; for export products, it is necessary to increase the proportion of processed products to reduce the cost of technical barriers.

(3) Build brands for products, such as: Actively registering private labels for exported fruits and vegetables; Coordinate with Vietnamese Ambassadors and Trade Offices in EU countries or the Fruit and Vegetable Association to participate in fairs and exhibitions to widely promote products; ...

4.2.2 For authorities

(1) Actively participate in new generation FTAs and effectively implement the commitments in the EVFTA Agreement, harmonize standards and regulations on goods quality, and agreements on goods quality, labor, environment and combating climate change in FTAs and EVFTA Agreements.

(2) Improve the effectiveness of the implementation of strategies to create sustainable export sources, such as: solutions to specialize in the cultivation of key fruit trees in each locality, specific guidance on the implementation of decisions planting area planning.

(3) Promote the development of the structure of export vegetables and fruits in the direction of improving quality and efficiency; building prestige and brand for Vietnamese fruit and vegetable products.

(4) Strengthen trade promotion, timely update information to support exporting enterprises, research products suitable to the specific needs of each consumption market.

5. CONCLUSION

The article has collected data on the situation of Vietnam's fruit and vegetable exports to the EU market in the period 2017-2021, and the results of qualitative and quantitative research show five factors affecting exports of fruits and vegetables from Vietnam to the EU market include: (1) Characteristics of the EU market, (2) Characteristics of Vietnam's macro environment, (3) Characteristics of exporting enterprises, (4) Export marketing strategies and (5) Competitors. All these 5 factors belong to the group of motivating factors, in which Characteristics of the EU market promote the strongest, and Competitors promote the weakest. Simultaneously, the research made recommendations for exporters and state management agencies to boost the efficiency of Vietnam's fruit and vegetable exports to the EU market.

Although the author has made every effort possible in the research process for this study, there are still some limitations that future research can further improve on. Firstly, the number of survey samples collected is modest with 157 answer sheets. Future studies should collect larger samples to improve the accuracy and reliability of the results. Secondly, future studies may add to the research model new factors to be able to further examine factors affecting Vietnam's fruit and vegetable exports to the EU market.

DIGITAL FINANCE, SHADOW ECONOMY, AND ECONOMIC GROWTH: EVIDENCE FROM SELECTED COUNTRIES

**Author: Ly Ngoc Lam¹, Hoang Thi Phuong Linh¹, Phan Nguyen Anh Quan¹,
Nguyen Ho Xuan Tra¹, Doan Ngoc Vy¹
Mentor: PhD. Tu Thi Kim Thoa¹**

ABSTRACT: This study examines the impacts of digital finance and shadow economy on economic growth in 54 selected countries during the period from 2012 to 2021. Economic growth calculated as GDP per capita is a dependent variable; digital finance calculated as mobile money transaction and shadow economy are independent variables; corruption, trade freedom and foreign direct investment (FDI) are control variables. By using GMM estimator, our research found that while digital finance could exert a positive impact on economic growth, shadow economy negatively influences economic development. Moreover, it is discovered that foreign direct investment also has a positive effect on economic growth, and trade freedom as well as corruption is investigated to be statistically insignificant. These findings are expected to make an outstanding contribution to the development of digital finance in various nations including Vietnam, and recommend several useful policy implications in order to enhance digital finance and mitigate shadow economy that are of great benefits to economic progress.

Key words: Digital finance, shadow economy, economic growth, mobile money transaction.

1. INTRODUCTION

The real economy's development cannot be accomplished without the backing of finance because it is the lifeblood of the real economy. Digital finance is a consequence of integrating traditional finance with digital technology. It is characterized by financial characteristics that are less reliant on traditional finance's physical channels, are more geographically penetrating, and offer lower cost advantages. The conversion of the financial industry to digital is a long-term, risky, and high-commitment process. To achieve sustainability, it needs reliable and ample financial resources. Finance is increasingly integrating with new technologies including big data, cloud computing, and artificial intelligence. According to research by the International Monetary Fund, digital payments, remittances, and financing have increased in emerging and developing nations at an unprecedented rate over the past three years. Digital payment services in emerging and developing nations increased from \$1.2 trillion in 2017 to \$1.5 trillion in 2019. Similarly, to this, mobile payments have grown by 50% in 2019 compared to 2018. In emerging and developing nations, the use of digital and mobile payments has expanded along with their value. For example, the number of mobile payment users climbed from 3.3 billion in 2017 to 4 billion in 2019, accounting for almost 64% of the population.

There has been a lot of discussion on the impact of the shadow economy on economic growth, but there are still several issues that need to be resolved, including how this type of activity can affect the formal economy and what impact it has on economic growth. Several studies have been made, including (Zaman & Goschin, 2015; Borlea et al., 2017; Mandroschenko et al., 2018). While defining the precise dimensions of the "shadow economy," these authors have also revealed the regularities of this phenomenon in order to determine whether this kind of activity could be a source of economic growth or depression, as well as to pinpoint and evaluate the variables influencing economic growth. In developing nations, the

¹ University of Economics Ho Chi Minh city.

shadow economy accounts for more than 30% of the total economy. The shadow economy has been found to have a negative effect on a nation's economic growth, according to a vast body of research. The political climate is predicted to play a significant effect in the growth of the shadow economy in earlier studies. Unstable political conditions encourage unemployment and low productivity, which leads to an increase in the informal economy. Additionally, some emerging nations have worse political stability indices than developed nations.

However, there are still several research gaps from previous studies that ought to be taken into consideration. Firstly, most researchers investigating the relationship between digital finance and economic growth relied on data from one nation or a small group of economies, particularly China (Liu et al, 2022; He et al, et al; Qian et al., 2020). Moreover, there are still many discrepancies and disagreements about the impact of the shadow economy on economic growth, as some writers have shown a negative association while others have shown a positive one.

Therefore, this research aimed to analyze the impact of digital finance and shadow economy on economic growth, using data collected from 54 countries around the world in 10 years during the period from 2012 to 2021. This study is expected to fill the gaps from previous research when utilizing data from many countries to generalize the results. Moreover, this study could contribute to consolidate and provide empirical evidence about the relationship between shadow economy and economic growth.

2. THEORETICAL FRAMEWORK

2.1. Solow growth model

The Solow growth model was developed by Robert Solow in 1956. According to the Slow Growth Model, technology is just as important an input to production as labor and capital, the two other basic components of production. Economic growth must be stimulated by technological advancement in the manufacture of goods, the delivery of services, and corporate operations. According to the concept, technological development increases service production and delivery efficiency, which results in high output productivity.

2.2. Technological spill - over theory

According to the technological spillover theory, digital finance can benefit the finance industry in three different ways. Technical staff are made available, financial disintermediation is accelerated, and financial inclusion is increased through technological spillover. By advancing technology, lowering costs, boosting outreach efforts in the financial industry, and increasing the effectiveness of the financial system, digital finance alters traditional financial institutions through the "spillover effect."

2.3. The effect of digital finance on economic growth

Digital finance is the combination of Internet technology and finance. It is a financial service created by the fusion of financial innovation and digital innovation such as distributed technology, big data, and artificial intelligence (Liu et al, 2022). The term is described as financial services provided via mobile devices, computers, the Internet, or payment cards. In the world, digital finance has become a major factor in modern finance with many innovative applications that can be found in fintech, banking services, and embedded finance.

In China, there are various empirical research investigating the impact of digital finance on economic growth. Liu et al. (2022) pointed out digital finance can, over time, improve the quality of China's economic growth, with the effect being more apparent in less developed areas. The mechanisms showed how improving

and advancing the industrial structure through digital finance might improve the quality of economic growth. Similarly, He et al. (2022), Jiang et al (2021) and Ding, Shi & Hao (2022) used 31 provincial regions in mainland China as their research subject, utilized the digital inclusive finance index to measure the level of digital finance to show that digital finance may foster regional economic development and has a favorable impact on economic development in terms of breadth, depth, and service support. Correspondingly, Zhu (2022) investigated the impact mechanism and impact of digital inclusive finance on high-quality economic development using panel data of 30 provincial regions in China from 2011 to 2019. It is discovered that high-quality economic development is directly and significantly impacted by digital inclusive finance. Another research related to digital inclusive finance (DIF) was conducted by Wang, He & Li (2022), they concluded that there is significant geographical variability in the impact of DIF on economic growth and inventive development, and DIF has a direct positive influence on economic growth and innovative development. In addition, Liu et al (2021) showed the results of the VAR model demonstrating that the development of digital financial inclusion significantly contributes to economic growth and that this impact is significantly mediated by the Internet threshold effect. Lastly, two other authors consisting of Gu & Sun (2022) also consumed China as a sample in order to indicate that investment in digitization is a major concern for the economic development of provinces since it makes a significant contribution to regional economic quality development. At the provincial level, Zou, Zhang, & Fan (2020) presented that the development of digital finance in Sichuan Province can support regional entrepreneurship, stimulate economic development, and reduce the income gap between urban and rural areas. In another country like Kenya, Misati et al (2022) offered a significant positive impact of financial depth on economic growth consistent with the supply-leading finance theory, and Mulee (2019) indicated that every aspect of digital financial innovation benefits Kenya's economy.

At a larger scale, Thaddeus, Ngong & Manasseh (2020) found a high correlation between digital financial inclusion and the advancement and expansion of sub-Saharan economic growth. Meanwhile, Ozturk & Ullah (2022) demonstrated that while digital financial inclusion spurs economic expansion, it also has a negative impact on environmental quality due to higher CO₂ emissions. With 52 developing countries, it is discovered by Khera et al (2021) that the exogenous component of digital financial inclusion is positively associated with growth in GDP per capita between 2011 and 2018. Based on above literature reviews, the hypothesis proposed is:

H1: Digital finance has a positive impact on economic growth

2.4. The effect of shadow economy on economic growth

According to Andrzej (2022), there are many words used to describe the shadow economy such as underground, informal, illegal, gray zone, not registered, off books, night economy, and moonlight, under reporting, or even black or immoral white economy.

On the one hand, shadow economy is indicated to have a positive impact on economic progress since it offers several methods for tackling unemployment and boosts the formal economy's expansion by bringing money generated by illegal transactions into it. Zaman & Goschin (2015) did discover a cointegrating relationship between GDP and the shadow economy through Johansen test, providing empirical support for the claim that the shadow economy was related to Romania's economic growth between 1999 and 2012. Similarly, Goel, Saunoris & Schneider (2019) and Mar'i & Cavusoglu (2021) also studied the negative impact of the underground economy on economic growth in the United States and 156 nations respectively. Correspondingly, Nguyen & Duong (2021) concluded that the BRICS countries' economic growth is positively impacted by the shadow economy and measures to control corruption.

On the other hand, several researchers also pointed out that shadow economy negatively affects economic growth because it hinders GDP growth rate and government revenue. Between 2005 and 2014, empirical research was done by Borlea, Achim & Miron (2017) proved that increased corruption and the shadow economy have a detrimental impact on economic progress. Similarly, Baklouti & Boujelbene (2020) demonstrated that rising levels of corruption and the shadow economy are associated with lower economic development in 34 OECD nations from 1995 to 2014. Results also suggest that the impact of corruption on economic growth is amplified by the shadow economy. In Libya, the credit crunch and the shadow economy had a significant impact on economic growth (Omar & Amlus, 2020). In another country, Ukraine, Kovalenko et al (2022) made a conclusion that shadow economy exerted an adverse impact on corporate business and households in Ukraine. This study also pointed out several root justifications why this nation experienced an informal economy. With a larger sample, 17 Asian countries with emerging and developing economies, Nguyen & Luong (2020) demonstrated that while the shadow economy has a statistically significant negative influence on economic growth, the corruption index has a statistically significant beneficial impact. With 51 countries and developing countries, Mayssa et al (2021) and Younas, Qureshi & Al-Faryan (2022) demonstrated that the size of the shadow economy has a significant negative impact on economic growth. Finally, in ECOWAS countries, Camara (2022) showed that the shadow economy reduces economic growth and CO2 emissions using annual data from 14 countries between 1991 and 2016. Seeing the big gap in academic research on the relationship between the Shadow economy and economic growth, authors decided to solidify the knowledge background by testing our second hypothesis, which is:

H2: Shadow economy has a negative impact on economic growth

From the above literature review, the influence of digital finance and shadow economy on economic growth has received special attention from scholars around the world. However, there are 2 research gaps that authors pointed out and addressed in this research. Firstly, when assessing the influence of digital finance on economic growth, different research results are provided. To be more particular, shadow economy has both positive and negative effect on economic growth. Due to disparities in location, religion, problem-solving approaches, and other factors, scientists may come to different conclusions about how the shadow economy affects economic growth. Therefore, this research was expected to clarify and consolidate the effect of informal economy on economic growth based on our research sample. Moreover, regarding research scope, most of authors conducting a study related to digital finance and economic growth based on data collected from a particular country or just a bloc of economies. Therefore, authors decided to collected data from a larger number of countries in order to diversify data and get better and more general research results.

3. RESEARCH METHODOLOGY

3.1. Data and sample selection

This study aimed to analyze the effect of digital finance and shadow economy on economic growth through collecting data from all countries around the world. Then, authors decided to remove several countries that experienced the inadequacy of data to avoid from missing value problem. Finally, authors got on data gathered from 54 nations worldwide from various continents from trustworthy sources, including the World Bank, International Monetary Fund (IMF), Heritage Foundation, and Medina & Schneider (2019).

3.2. Variable measurement

3.2.1. Dependent variable

Though no unanimously accepted definition has been forgotten by now, economic growth or economic development is a phenomenon that can be statistically quantified using economic indicators like GDP and GNP. It is seen as a well-determined goal for all countries. Therefore, it could be argued that while

development demonstrates how growth affects society by raising the standard of living, economic growth is the process of expanding the sizes of national economies, the macro-economic indicators, especially the GDP per capita, in an ascendant but not necessarily linear direction. The goal of economic progress is unquestionably the multifaceted fulfillment of human potential, increased material and spiritual richness for the populace, and their ascent to higher levels of civilization and culture.

In this study, economic growth (EG) is measured by GDP per capita (constant 2015 US\$) collected from World Development Indicators (WDI) - World Bank (Nguyen & Duong, 2021; Borlea, Achim & Miron, 2017).

3.2.2. Independent variable

Digital finance: is a combination between financial services and digital technologies such as the Internet (including mobile and Internet of Things), big data, distributed technology (such as cloud computing and blockchain), artificial intelligence, and information security (biometrics and encryption). Financial inclusion and financial intermediation are facilitated by digital finance, which also helps to fight poverty and advance sustainable development. Digital finance also significantly influences industrial structure, which has the potential to benefit the economy. Digital finance is becoming important to both developed and developing nations worldwide. The use of and access to affordable financial services and products by the underprivileged, low-income, and disadvantaged portion of the population through M-banking, E-banking, ATMs, etc. is known as digital finance. Digital finance improves the availability of required financial inclusion services including opening a bank account, using credit, and using bank savings services. For the purpose of achieving benefits through financial inclusion, countries are starting to adopt plans to improve people's access to financial digital inclusion (Thaddeus, Ngong & Manasseh, 2020). Mulee (2019) demonstrated that digital finance is of great benefits to economic development in Kenya. Correspondingly, Jiang et al (2021) pointed out that economic progress in China could be enhanced by the development of digital finance.

Digital finance is measured in several ways, however, in our research, digital finance is analyzed through mobile money transaction collected from Financial Access Survey - IMF and number of ATMs per 100,000 adults which is used for robustness test (Syed et al, 2021).

Shadow economy: Shadow economy is defined as mostly the legal economic and productive activities that are deliberately hidden from official authorities and that, if recorded, would contribute to GDP (excluding illegal or criminal activities, and do-it-yourself, charitable or household activities) (Andrzej, 2022).

There are various justifications why informal sectors have a considerable impact on economic growth. On the one hand, shadow relations lessen social conflict and mitigate unfavorable social contrasts between the rich and the destitute. Because of the shadow phenomenon, both the national GDP and the regional GDP are on the rise. The official economy's financial and industrial sectors get investments from the shadow economy as well (Mandroschenko, Malkova & Tkacheva, 2018). However, negative effects of shadow economy are unavoidable. The country's tax system is distorted by the shadow economy, which does not give budgets at all levels enough tax revenue. The state of the public finances is badly impacted by the shadow activity, which also diminishes the state budget and distorts its structure and financial sphere. Also, the country's monetary system is badly impacted by the shadow activities. The reproduction of the work force in the formal economy is negatively impacted by the phenomenon of the shadow economy. Investment procedures are also distorted by the shadow economy's activity (Mandroschenko, Malkova & Tkacheva, 2018).

Shadow economy is measured by the size and development of the informal sector (Medina & Schneider, 2019). There are diverse previous research using this calculation in studying the effect of shadow economy (Nguyen & Luong, 2020; Baklouti & Boujelbene, 2020)

3.2.3. Control variable

Corruption is measured as control of corruption and collected from Worldwide Governance Indicators - World Bank (Spyromitros & Panagiotidis, 2022). **Trade freedom** is measured by the trade freedom index (TF), scored on this index range from 0 to 100. In order to gather information for the Trade Freedom Index, the Heritage Foundation is a trustworthy source (Siddik et al, 2022). **Foreign direct investment** is measured as foreign direct investment, net inflows (% of GDP), collected from World Bank database (Sukar, Ahmed & Hassan, 2007; Susilo, 2018).

3.3. Model specification

Following Syed et al. (2021); Nguyen & Duong (2021); Jiang et al. (2021); Liu et al. (2022), authors strived to analyze the impact of digital finance and the shadow economy on economic growth, as follow:

$$EG_{it} = a_0 + a_1 EG_{it-1} + \beta_1 MO_{it} + \beta_2 SE_{it} + \beta_3 COR_{it} + \beta_4 TF_{it} + \beta_5 FDI_{it} + \varepsilon_{it}$$

Where:

EG_{it} is the dependent variable for economic growth, measured in GDP per capita (constant 2015 US\$), measured in natural logarithm, with indicating the country (i) and time (t), respectively.

a_0 is intercept term.

$a_1, \beta_1, \dots, \beta_7$ are the respective sensitivity coefficients for the six variables.

MO_{it} is an independent variable and an indication of digital finance measured by mobile money transaction (% of GDP), with indicating the country (i) and time (t), respectively.

SE_{it} is an independent variable and measured by size and development of shadow economy as a percentage of real GDP per capita, with indicating the country (i) and time (t), respectively.

COR_{it} is a control variable and represents control of corruption, with indicating the country (i) and time (t), respectively.

TF_{it} is a control variable and indicates the index of trade freedom, with indicating the country (i) and time (t), respectively.

FDI_{it} is a control variable and indicates foreign direct investment, measured by net inflow as a percentage of GDP, with indicating the country (i) and time (t), respectively.

ε_{it} is the error term.

Table 1. Variable description

Source: Authors

Variable	Label	Measurement	Source	Expected sign
Economic growth	EG	GDP per capita (constant 2015 US\$)	World Development Indicators (WDI) – World Bank	N/A

Shadow economy	SE	Size and development of the shadow (%)	Medina & Schneider (2019)	-
Corruption	COR	Control of Corruption Index	Worldwide Governance Indicators – World Bank	+
Trade freedom	TF	The index of trade freedom	Heritage Foundation	+
Foreign direct investment	FDI	Net inflow of foreign direct investment (%)	WDI - World Bank	+

3.4. Data analysis

To deal with endogeneity as well as dynamics, many estimation methods have been developed, with the central role being the use of instrumental variables. Among them, GMM is one of the most used estimators, allowing to overcome the difficulty of choosing instrumental variables and solving endogenous

problems. To evaluate the effectiveness of this method, the authors base on the AR (1) and AR (2) correlation tests, and use the Sargan and Hansen tests. Accordingly, test Sargan and Hansen (1998) to determine the appropriateness of instrumental variables in the research model. Arellano - Bond test (1991) to test the first order autocorrelation through AR (1) test, and AR (2) test evaluates the 2nd order series correlation in the model. Additionally, we address the substantial measurement error presence by using a two-step system GMM to estimate dynamic unbalanced panel data (Lee, 2007).

4. RESULTS AND DISCUSSION

4.1. Descriptive statistics

Table 2. Descriptive statistics

Source: Author's synthesized by Stata

Variable	Obs	Mean	Std. Dev.	Min	Max
EG	540	9.9773	5.6062	6.4173	23.2502
SE	324	0.3125	0.0918	0.131	0.582
MO	439	0.5189	0.3803	0.0299	1.0618
COR	540	-0.5169	0.4534	-1.1426	0.2616
TF	530	72.5184	6.9929	62.6	82.5
FDI	540	0.0425	0.0917	-0.4008	1.0902
ATM	519	25.1357	25.1253	0.0906	117.7917

Note: This table reports the results of descriptive statistics. There 7 variables used in this study include: economic growth (EG), shadow economy (SE), mobile money transactions (MO), number of ATMs per 100,000 adults (ATM), corruption (COR), trade freedom (TF), foreign direct investment (FDI).

Accordingly, economic growth of the selected countries measured by GDP per capita has the mean value of 9.98 with the minimum value at 6.42 and the maximum value at 23.25. In addition, the average shadow economy is 31.25%. The average mobile money transactions are about 51.9%. Finally, the control variables, including COR, TF, FDI and ATM have the mean values of the variables at -0.52, 72.52, 4.26%, 25.14 respectively.

4.2. Correlation matrix

Table 3. Correlation matrix

Source: Author's synthesized by Stata

	EG	SE	MO	COR	TF	FDI
EG	1					
SE	-0.9665	1				
MO	0.9455	-0.9237	1			
COR	0.0992	0.0077	0.0482	1		
TF	-0.0981	0.1321	-0.0910	0.3223	1	
FDI	0.0901	-0.0838	0.1231	0.1360	0.0525	1

Note: This table reports the results of correlation matrix. There 6 variables displayed in this table include: economic growth (EG), shadow economy (SE), mobile money transactions (MO), corruption (COR), trade freedom (TF), foreign direct investment (FDI).

In the correlation matrix table, the independent variables in the study are all correlated with the dependent variable. Accordingly, the independent variable digital finance measured by mobile money transactions has a positive correlation with economic growth, with 0.9455, consistent with research expectations. Moreover, shadow economy has a negative correlation with economic growth, with -0.9665, consistent with our

expectations as well. Moreover, digital finance measured by mobile money transactions has a negative correlation with shadow economy, with -0.9237 . The correlation coefficients of the independent variables are all less than 1, so the regression model rarely has multicollinearity.

4.3. Research findings and discussion

Table 4. The effect of shadow economy and digital finance on economic growth – GMM estimator

	2.25
COR	-.0005
	-0.69
TF	.00009
	1.26
FDI	.0063***
	3.07
Cons	.0656307
	2.26
AR (2)	0.447
Sargan's test - p-value	0.427
Hansen's test - p-value	0.504

*Notes: ***, **, and * denote statistical significance at the 1%, 5%, and 10% significance levels, respectively. Where the model is $EG_{it} = a_0 + a_1 EG_{it-1} + \beta_1 SE_{it} + \beta_2 MO_{it} + \beta_3 COR_{it} + \beta_4 TF_{it} + \beta_5 FDI_{it} + \epsilon_{it}$ where EG represents economic growth, SE stands for shadow economy, digital finance measured as mobile money transactions (MO) and the others are control variables: corruption (COR), trade freedom (TF) and foreign direct investment (FDI).*

The table 4 offers insights into the statistics that the estimated model has the p-value of the AR (1) test less than the significance level of 5% and the p-value of the AR (2) test is larger than the significance level 10%. Therefore, the models have first order autocorrelation but no second order residual autocorrelation. At the same time, the Hansen test of the model has p-value greater than the significance level of 10%, which means the instrumental variables used in the model are appropriate. Moreover, the p-value of the Sargan test is also greater than the 10% significance level. The illustrative estimation result has the largest number of tools, which is 32, lower than the number of groups, so the stability is guaranteed. From these results, authors can conclude that the conditions for the model's consistency and rationality are quite satisfied.

As far as table 4 is concerned, digital finance (MO) exerts a positive impact on economic growth (EG). To be more detailed, 1 increase in digital finance will result in an 1.51% increase in economic growth at a 5% significant level. Therefore, hypothesis H1 is accepted. This result is consistent with previous studies

(Liu et al, 2022; Mulee, 2019; Jiang et al, 2021). According to the Slow Growth Model, technology is just as important an input to production as labor and capital, the two other basic components of production. Economic growth must be stimulated by technological advancement in the manufacture of goods, the delivery of services, and corporate operations. According to the concept, technological development increases service production and delivery efficiency, which results in high output productivity. There is a two-way relationship between technological advancement and the financial system, in which the former promotes the latter's expansion. The frequency with which financial systems lend money to economically inventive entrepreneurs increase with the development of financial systems, which in turn contributes to economic growth. The model is important for this study because it emphasizes how the advancement of technology in the financial sector contributes to economic growth. According to the technological spillover theory, digital finance can benefit the finance industry in three different ways. Technical staff are made available, financial disintermediation is accelerated, and financial inclusion is increased through technological spillover. By advancing technology, lowering costs, boosting outreach efforts in the financial industry, and increasing the effectiveness of the financial system, digital finance alters traditional financial institutions through the "squid effect." An explanation for this correlation could be that through scenarios, data, and financial innovation products, digital finance can make up for the drawbacks of traditional financial services, fully exploit the benefits of "cheap cost, rapid speed, and wide coverage," and lower the threshold for financial services and service costs. Thus, the financial challenges faced by businesses are reduced, their R&D costs are assured, technological innovation is facilitated, and eventually, the advancement of their technological competence and total factor productivity is fostered (Sun, 2021). Additionally, according to Fu et al. (2021) and Li et al. (2020), household consumption is stimulated by digital finance, aiding in industry restructuring and enhancing bank efficiency. Moreover, digital finance could enhance industry – an important factor of economic growth. Particularly, digital finance obtains consumer data through utilizing the benefits of digital technology, Internet trading platforms, market applications of information technology, and management innovation (Xu et al., 2021). Digital finance can promote industry fusion and correlation with upstream and downstream industries that can be formed based on the industrial convergence of new industries and new formats, accelerate industry differentiation and reorganization, and ultimately promote the improvement of industrial structure that results in economic development (Zhang, 2018). It might also cut the financing costs and minimal financial service requirements for industrial issues. The availability of financial services is increased thanks to digital finance, which also lowers the requirements for industrial subjects to access financial services, lowers the information cost of financing industrial subjects, and broadens the financing channels (Li & Ran, 2021).

Shadow economy (SE) negatively affects economic growth. To be more detailed, at 10% significance level, 1 increase in the shadow economy will result in a 6.84% decrease in economic growth, which is in line with Nguyen & Luong (2021); Mayssa et al (2021); Borlea, Achim & Miron (2017) and Younas, Qureshi & Al-Faryan (2022). A growing shadow economy causes tax revenues to drop significantly and the delivery of public goods to deteriorate, both of which can hinder economic growth. Government spending and transfers typically reduce as tax revenues fall. The availability of public services for everyone in the economy diminished as the shadow economy grew, which had a negative impact on economic growth (Loayza, 1996). Additionally, the existence of the informal economy reduces the effectiveness of macroeconomic policy, which is largely predicated on the notion that unofficial activities, by fostering unfair competition, adversely affect how the market is allocated. In addition, shadow activity has a negative impact on the status of the public finances, as well as the state budget's size, structure, and financial environment. The shadow activities also have a significant negative impact on the nation's monetary system. The phenomena of the shadow economy have a detrimental effect on the reproduction of the labor force in the traditional economy. The operation of the shadow economy distorts investment procedures as well (Mandroshchenko, Malkova & Tkacheva, 2018).

Foreign direct investment has a positive effect on economic growth due to the impacts of transferring technology and expanding employment opportunities (Mehic et al, 2013). Particularly, at 1% significance level, 1 increase in foreign direct investment will result in a 0.63% increase in economic growth. This result was discovered by various authors (Susilo, 2018). The remaining variables including corruption and trade freedom have no statistically significant effect on economic growth.

4.4. Robustness test

*Notes: ***, **, and * denote statistical significance at the 1%, 5%, and 10% significance levels, respectively. Where the model is $EG_{it} = a_0 + a_1EG_{it-1} + \beta_1SE_{it} + \beta_2ATM_{it} + \beta_3COR_{it} + \beta_4TF_{it} + \beta_5FDI_{it} + \epsilon_{it}$ where EG represents economic growth, SE stands for shadow economy, digital finance measured as number of ATMs per 100,000 adults (ATM) and the others are control variables: corruption (COR), trade freedom (TF) and foreign direct investment (FDI).*

To test the robustness, the authors use another measurement for the digital finance variable instead of mobile money transactions. The variable used is the number of ATMs per 100,000 adults, as suggested by Syed et al (2021). Table 5 shows that it is consistent with the regression results when ATM is used as an independent variable. Particularly, 2 independent variables including digital finance and shadow economy are statistically significant.

5. CONCLUSION AND RECOMMENDATION

The research "Digital finance, shadow economy and economic growth: Evidence from selected countries" was conducted in order to clarify the influence of digital finance and shadow economy on economic growth based on data collected from 54 countries during the period from 2012 to 2021. The

results demonstrated that while digital finance is of great benefits to economic growth, informal economy could pose a threat to economic development, which means that the research method used is stable and appropriate.

Authors found out that Digital Finance positively affects economic growth. The discoveries provide a variety of policy implications for fintech innovation and banking regulation. First and foremost, governments ought to promote a greater digitalization of banking services in developing nations. To compete with developed nations, developing markets need sufficient revenue and resources, which digitalization aids in obtaining through inclusive growth and a decline in the informal sector. Secondly, developing nations should make greater investments in building safe and reliable digital infrastructure since unstable and dangerous digital platforms increase the likelihood of fraud and financial risk. Welfare-focused digital banking services for people, enterprises, and households should be promoted by policymakers. To encourage digital transactions, the government could also give some financial support or subsidies to people and financial institutions. Government should also ensure that there is less regulation for fintech service providers so that they can develop their financial technology and intermediation function while minimizing costs, when possible, to better serve their clients. Policymakers should also consider the cost of providing fintech services to people, enterprises, and households in order to maintain proper budgetary resources. Thirdly, in order to fully leverage digital technology's favorable impact on increasing income distribution, we must take advantage of the symbiotic and mutually reinforcing relationship between the development of digital finance and other economic systems. As stated in the text, the effects of the development of the digital financial industry on the distribution of income within an area are not isolated, and the interaction between the development of the digital financial industry and personal capital - both human and material - will also be seen. Government agencies should therefore disregard the association between digital finance and other development factors when developing policies on the development of digital finance, as well as treating it as an independent variable affecting regional income distribution.

The main goals are to:

- boost local economic growth and raise residents' income levels;
- balance regional spending on education, encourage balanced educational growth, and ensure that all students have equal access to quality education;
- maintain foreign investment attraction and trade structure optimization;
- increase the flow of financial expenditure to local businesses.

Besides, authors also noticed that the Shadow economy has a negative impact on economic growth. Our findings indicate that if long-term economic policy is to reduce the size of the shadow economy, it should prioritize human development, economic and capital market growth, and economic freedom while reducing income inequality, streamlining the tax code, and reducing VAT rates, tariffs, and income taxes to the extent that this is feasible and does not conflict with other economic policy objectives. As a sample, institution quality factors dominate other shadow economy issues. Authors advise policymakers to reduce bureaucracy and over-regulation while also fostering an atmosphere that is more democratic and transparent in order to strengthen institutions. In order to improve the quality of institutions, policymakers must develop policies. Authors will be unable to decrease the extent of the shadow economy without high-quality institutions. The expanding shadow economy can also be combated by reducing inflation through macroeconomic environment reform and bridging the wealth and poverty divide.

Despite our best efforts, our research has a few unexpected limits. First of all, this study was conducted over a 10-year period, which is still regarded as a short time frame. 54 nations have been utilized to study the connection between digital finance, shadow economy and economic growth. As a result, the scope of the research should be considered and expanded in the future. Data for analysis should be gathered over a

longer time span, such as 20 or 30 years, in order to be more in-depth. Following this, it is required to do the research based on a larger number of countries in order to have a thorough and comprehensive study. In addition, digital finance could be analyzed by other measurements including number of registered mobile money accounts per 1,000 adults or number of active mobile money accounts per 1,000 adults.

ECONOMIC FREEDOM, FINANCIAL DEVELOPMENT, AND FOREIGN DIRECT INVESTMENT: A COMPARATIVE STUDY OF DEVELOPED AND DEVELOPING ECONOMIES

**Author: Le Quynh Anh¹, Nguyen Ha Tuan Khoa¹, Nguyen Phan Thuy Khue¹,
Truong Nguyen Yen Ly¹, Khuc Hai Quynh¹
Mentor: Le Anh Tuan¹**

ABSTRACT: This research investigates the impact of economic freedom on foreign direct investment as well as the moderating role of financial development in this linkage. Employing international data from 161 countries from 1995 to 2020, we find that an improvement in economic freedom can increase foreign direct investment in developing countries. However, there is no significant evidence of a relation between economic freedom and foreign direct investment in developed countries. Our further analysis shows that the positive nexus between economic freedom and foreign direct investment is less pronounced for countries with high financial development. Our findings are robust after addressing endogeneity by using a dynamic approach from a two-stage system GMM estimation. Overall, our study points to the presence of heterogeneity in the effect of economic freedom that addresses its benefits in developing countries, thereby providing implications for policymakers in attracting foreign investors.

Keywords: Economic Freedom, Foreign Direct Investments, Financial Development

1. INTRODUCTION

Despite the economic downturns during the 26-year period, FDI inflows globally still manage to reach its peak at nearly 3.13 billion USD (OECD, 2007), reflecting a growing trend compared to the previous period. Numerous papers have shown the financial benefits of FDI such as aiding the transfer of technology to developing nations (Osano & Koine, 2016), boosting labor force expansion (Hale & Xu, 2016), and encouraging the business environment to be more competitive through the creation of international corporations (MNCs) (OECD, 2002). This led to emerging countries' remarkable economic development and poverty reduction. FDI is necessary for both developed countries and developing countries. Notably, developing countries make use of the FDI flows as an external source of finance for economic development, whereas in the case of developed countries, FDI flows can be used as a reassurance for sustainable economic development. IMF and WTO are the two main organizations that encourage the growth of FDI flows by eliminating the restrictions for capital transfer. In addition, national governments are also adjusting the policies to attract this type of capital source. However, before investing in another nation, foreign investors carefully study the host country's socioeconomic characteristics, with economic freedom being a crucial component that must be examined.

Karabegovic et al. (2003) defined economic freedom as the ability of firms to make decisions about their businesses without facing the restriction from the government or government policies against the free-market behaviors seized by economically powerful groups to limit the economic choices of others. Economic freedom is a manifestation of an open and effective economy, governments that respect and support openness and free markets create a better opportunity for innovation and advancement, eventually leading to greater human flourishing (Torstensson, 1994). Economists have studied the link and impacts of economic freedom on the FDI inflows in several years, in different regions. Quazi (2007) indicates that

¹ University of Economics Ho Chi Minh city.

economic freedom is a key factor that has a significant impact on the FDI, a higher level of economic freedom means a larger domestic market size, higher returns on investment, and also a more competitive business environment. In addition, economic freedom also encourages the promotion of FDI by increasing the likeliness of receiving FDI inflows (Zghidi et al., 2016).

Several studies have explored the impact of economic freedom on FDI in certain regions, such as East Asia (Quazi, 2007), South Asian (Nasir & Hassan, 2011). Nasir & Hassan (2011) indicates that policymakers in South Asian countries should put more effort into enhancing the level of economic freedom as a way to attract more FDI to the countries. Moussa, Çaha, and Karagöz (2016) investigate the economic freedom and its macroeconomic component to attract the FDI inflow at the regional and global levels. Although many papers have investigated the impact of economic freedom on FDI, a comparative study of developed and developing countries is not fully conducted. In this study, we fill this gap in the literature by using a global sample of 161 countries around the world over a 26-year period to compare the impact of economic freedom on FDI. Answering these research questions is crucial because FDI is considered as an important factor that significantly contributes to economic growth of the country.

The main purpose of this study is to analyse the relationship between economic freedom in a given country and the attraction of FDI inflows. We use the Economic freedom index collected from the Heritage organisation website as our main source of data as these data illustrate the correlation of economic freedom to other factors, such as rule of law, government size, regulatory efficiency, and open markets. The index provided us with a closer look into how the Economic freedom index can be a detrimental factor when attracting FDI inflows in both developed and developing countries. In addition, we examine heterogeneity in the relationship between economic freedom and FDI by using cross-sectional analysis that employs financial development as a moderator. In this way, we can explicitly explore the role of country-level financial conditions in attracting investment from foreign investors. Notably, one may argue our results suffer from endogeneity. We use the two-step Generalized Method of Moments (GMM) estimator to allow us to obtain more efficient, unbiased, and consistent estimates and address the potential and endogeneity problems.

Employing a cross-country sample of 161 developing and developed countries over the 1995 – 2020 period, we find a significant positive impact of EF on FDI in developing countries, in line with Quazi (2007). Interestingly, there is no significant linkage between EF and FDI in developed countries.

This study is among the very first studies that examine the relationship and impacts of EF on the FDI inflows in 161 countries globally for the period of 1995-2020. Given that the empirical results from a single country are still unclear, we take advantage of international data to provide robust evidence about the positive impact of EF on FDI, especially in developing countries.

Finally, this study adds to the corpus of literature that is being written about EF and the connection between FDI inflows and economic development. According to our findings, it is critical to take into account regional variations in financial development when analysing how financial development influences how much FDI contributes to growth. It is crucial for decision-makers to comprehend how local economic freedom policies impact the growth-enhancing effects of FDI. For FDI to have a major impact on economic growth, policymakers should concentrate on effectively maximizing the flexibility of the domestic economy.

The remainder of the paper is as follows. Section 2 provides a literature review and hypothesis development. Section 3 describes the methodologies including data selection, variable definitions, and model. Section 4 presents the empirical results and we come to a conclusion in Section 5.

2. THEORETICAL FRAMEWORK

2.1. The causal relationship between the Economic Freedom and Foreign Direct Investment

Scholars have examined the relationship between EF and FDI inflows in various regions over years. According to Quazi (2007), EF is a major element that has meaningful effect on FDI; greater level of EF implies larger domestic market, higher return on investment, and a higher level of competition. EF also promotes FDI by raising the likelihood of FDI inflows (Zghidi et al., 2016). Other scholars have thrown light on the link between EF and FDI spillovers by taking certain geographically grouped economies into account. The outcomes demonstrate that FDI is significantly influenced by EF and macroeconomic variables, along with trade. Imtiaz and Bashir (2017) revealed that EF had a positive and statistically significant impact on FDI. Imtiaz et al. (2017) examined the Economic freedom index and other macroeconomic variables for attracting FDI in South Asia from 1995 to 2014, the outcomes suggest that general EF is a key factor of FDI. Along the way, there were researchers who focused on the conditions of the nations they studied, such as Quazi (2004), who researched whether EF, may determine FDI inflows in developing countries. The research used average data from 1995 to 2000 for a cross-section of 67 developing nations, discovered that EF is a significant and robust element of FDI.

FDI provides nations with quick access to advanced technology, which may help both the company receiving investment and other local companies. FDI can boost exports by creating assembly plants and aiding local businesses in entering overseas markets (Aitken et al., 1997). However, other experts denied the particular benefits of FDI flows. They also stressed the negative social consequences of EF. According to Krugman (2000), international investors can benefit from liquidity-constrained local capitalists' fire sales of property throughout economic downturns. In this case, foreign investors buy domestic firms due to their better cash position instead of having technological supremacy. Razin et al. (1999) asserted that nonnative venture investors' off-balance knowledge superiority may lead to overinvestment. Previous studies have demonstrated that FDI does not arise by chance but depends on the recipient nations' ability to absorb them, which is affected by a range of variables. Blomstrom et al. (1994) observed that FDI has a greater beneficial impact on growth in nations with a larger degree of evolution. Balasubramanyam et al. (1996) examined the effectiveness of FDI due to the commercial policies of the beneficiary nations.

2.2. The relationship between Economic Freedom and Foreign Direct Investment under the effect of Financial Development

Researchers found that FDI has a greater impact on countries with export-oriented policies. However, the development effect of FDI in developing nations with import replacement policies could not be observed. Strategies of import replacement reduce the efficacy of FDI by modifying the yields from both government and personal capital (Balasubramanyam et al., 1996). FDI has a minor direct influence on development, but it contributes favourably to growth in nations where human resources are over a defined limit (Borensztein et al., 1998). This is because FDI is related to a country's labour force's degree of education. Therefore, advanced nations tend to benefit more from FDI than developing nations because of their greater human resources. This is further reinforced by Xu (2000) that US multinational corporations' transmission of technology is attributed to capacity development in developed nations but not in underdeveloped nations.

Alfaro et al. (2004) found that instead of HR, economic territory expansion was more important for FDI spillovers. Financial sector improvement also affects FDI spillovers. Scholars like Hermes and Lensink (2003), Alfaro et al. (2004, 2010), and Durham (2004) recognized the importance of well-functioning financial institutions for successful technological spillovers. Bank and stock market growth were related to

physiological FDI spillovers. A better-developed financial system contributed positively to the transfer of new tech associated with FDI.

Studies have linked EF to development. Financial experts believe it includes the ability to choose and provide materials, competition between companies, free trade, and protected ownership. EF can explain why some countries are more financially successful than others. However, when researchers used the index elements instead of the gross economic freedom standard, they found that the impacts varied among elements (Heckelman & Stroup, 2000; Carlsson & Lundstrom, 2002).

Research on the connection between FDI and development is limited, particularly on the impact of EF on FDI. Although it is logical to assume that nations that support higher EF are more likely to gain from multinational corporations, there is no strong practical proof to back up this claim. Studies show a favourable association between EF and economic growth (De Haan & Sturm, 2000; Olson, 2000; Justesen, 2008). Research also indicates that EF is a significant element that stimulates increases in inward FDI, indicating good business and investment conditions. For example, Bengoa and Sanchez-Robles (2003) recognized a link between EF and inward FDI in Latin America, contending that nations with fewer limitations and stronger institutions will attract more FDI.

The Heritage Foundation countries' EF is calculated by using four categories and 12 factors: property rights, government integrity, judicial effectiveness, government spending, tax burden, fiscal health, business freedom, labor freedom, monetary freedom, trade freedom, investment freedom, and financial freedom. After running the regression tests, we propose the first hypothesis which is established to test the relationship between EF and FDI:

H1: Economic freedom has a positive impact on foreign direct investment.

To test if EF has a different impact on FDI between nations with high and low levels of financial development, we develop the following hypothesis. Financial growth is necessary for attracting FDI since foreign businesses can easily access financial services and outside funding to expand their commercial operations (Ezeoha and Cattaneo 2012; Agbloyor et al. 2013; Suliman and Elia 2014). Moreover, the level of financial sector development promotes FDI (Alfaro et al. 2008; Lee and Chang 2009; Al Nasser and Gomez 2009). Increasing access to external financing and indirect support for overall economic activity resulting from financial growth encourages FDI inflows (Alvarez and Lopez, 2013; Desbordes and Wei, 2014). As financial development improves, more productive firms with foreign ownership function in manufacturing sectors that are more dependent on external financing, and the effect of EF on FDI is less pronounced. However, higher destination nations' financial development could discourage FDI in several ways (Antras et al., 2009; Ju and Wei, 2010; Bilir et al., 2013).

Numerous studies (Hermes and Lensink, 2003; Alfaro et al., 2004, 2009, 2010) have highlighted the significance of a strong financial system for local firms to benefit from foreign technology spillovers. Financial development encourages inbound FDI in both source and destination countries. The financial advantage of foreign companies over domestic firms (Desai et al., 2004b, 2008; Alfaro and Chen, 2012) is linked to their home nations' financial depth, with implications beyond short-term perspectives.

H2: The positive impact of economic freedom on foreign direct investment is less pronounced for high financial development levels countries.

3. RESEARCH METHOD

3.1. Data collection

This study examines the relationships between economic freedom and foreign direct investment and the moderating impact of financial development on this relationship using international data between 1995 and 2020. We firstly collect our country-level data from different sources, then combine and store them as panel data.

After removing some countries that contain missing observations to minimize the error, the final sample throughout the 26-year period from 1995 to 2020 consists of 161 countries, including 34 developed countries, 127 developing countries and one special administrative region of China (Hong Kong) recognized by the United Nations. Our final sample is an unbalanced panel data of 3,634 country-year observations from developed and developing countries.

3.2. Measurement for Foreign direct investment (FDI)

Foreign direct investment (FDI) is the acquisition of stock in a company by a corporation based outside of its home nation. According to the balance of payments, FDI is the total of equity capital, long-term capital, and short-term capital. Economic growth can be supported by FDI in both the investing and receiving nations. Many countries now use FDI as a source of funding to build infrastructure and create jobs for their citizens. However, FDI has a drawback, which is the need for considerable government regulation and control, increasing the risk of political danger.

This variable is used commonly in previous studies as a good measure of direct foreign investment (Lehmann et al., 2004; Wacker, 2013).

3.3. Measurement for Economic freedom (EF)

Following prior studies (DeHann&Sturm, 2000; Heckelman, 2000; Quazi, 2007), we use The Heritage Foundation's Economic freedom index to measure economic freedom, based on 12 factors within 4 categories: Rule of Law (Property rights, Judicial effectiveness, Government integrity); Government Size (Government spending, Fiscal health, Tax burden); Regulatory Efficiency (Business freedom, Monetary freedom, Labor freedom) and Open Markets (Trade freedom, Financial freedom, Investment freedom).

Four categories are graded on a 0 to 100-point scale. The overall score of economic freedom of each country is calculated by averaging those 12 factors equally. We name the Economic freedom index as ECON_FREE, higher values of ECON_FREE denote higher economic freedom in a given country.

3.4. Control variables

We include a rich set of control variables that may influence FDI, taking their data from World Development Indicators, The World Bank. First, Onyeiwu and Shrestha (2004) indicate that inflation (INFLATION) is one important determinant of foreign direct investments. Second, Billington (1999) found that the host country's unemployment rate (UNEMPLOYMENT) was also a positive significant determinant of the location of FDI inflows. Also, political stability (PVE) has been singled out as a beneficial influence that can interpret FDI (Busse & Hefeker, 2007).

According to Nunnenkamp (2002), population growth (POP) belongs to the group of market factors that positively affect FDI inflows in the host countries. Moreover, GDP was shown to be related to the degree of FDI input. Asiedu (2002) discovered a greater GDP per capita (CAPITA) indicates good possibilities for foreign direct investment in the host country. The established paradigm that suggested a rise in FDI would cause a rise in GDP, was not producing results; rather, as GDP grows, a country becomes more appealing to foreign investment funds. Therefore, we conclude that GDP growth (GDPGROWTH) is linked to FDI inflows and has a positive impact on FDI.

Finally, as our final control variable, we considered the urban population (URBAN). The reason for this is that He Canfei’s 2002 research on the destinations of FDI in China found that FDI tends to prefer cities with higher urban population concentrations due to urbanisation economies.

3.5 Basic models

The effects of economic freedom on FDI are empirically investigated using the multiple linear regression (MLR) model as follows:

$$LOG(FDI)_{i,t} = \beta_0 + \beta_1 ECON_FREE_{i,t} + \alpha'Control_{i,t} + \delta_t + \delta_i + u_{i,t} \quad (1)$$

where i and t denote country and time, respectively. In this equation, the capital inflows of the country i from abroad in the year t are known as foreign direct investment ($FDI_{i,t}$) which is the dependent variable. The independent variable economic freedom, which $ECON_FREE$ illustrates, is represented in country i in year t . β_0 is the intercept while β_j is the slope parameter of the explanatory variables. In addition, we include a rich set of control variables, “Control”, that may influence the relationship between economic freedom and foreign direct investment. Specifically, we employ Unemployment rate, Inflation rate, Financial development, Population growth, Political stability, Urban population, GDP per capita, and GDP growth; and Financial development. To capture country- and time-invariant unobservable factors that may influence the relationship between economic freedom and foreign direct investment. We include year (δ_t) and country (δ_i) fixed effects in the model. Our main focus in Eq. (2) is the coefficient on $ECON_FREE$ (β_1). Consistent with Hypothesis 1, if an improvement in economic freedom leads to an increase in foreign direct investment, we should expect that β_1 becomes positive and statistically significant.

Further, to investigate the moderating role of financial development in the economic freedom and foreign direct investment nexus, we estimate the following model:

$$LOG(FDI) = \beta_0 + \beta_1 ECON_FREE_{i,t} + \beta_2 High_FD_{i,t} + \beta_3 ECON_FREE_{i,t} \times High_FD_{i,t} + \alpha'Control_{i,t} + \delta_t + \delta_i + u_{i,t} \quad (2)$$

where sub-indexes i and t represent the country and the year, respectively. All variables are well defined in equation (2). We define $High_FD$ as an indicator variable that equals 1 for countries that have financial development index which is greater than the yearly sample median. Notably, the coefficients of the interaction term $ECON_FREE_{i,t} * High_FD_{i,t}$ ($\beta_3\beta_3$) will explain whether economic freedom with financial development enhances or sets back FDI. This suggests that $\beta_3\beta_3$ indicates the economic freedom’s impact on the FDI rate if the appearance of the financial development is taken into consideration, or else. To be more specific, if economic freedom is linked more strongly with the FDI given the assistance of financial development, the coefficient of the interaction term $\beta_3\beta_3$ would be anticipated to be significant and negative.

4. RESULTS AND DISCUSSIONS

4.1. Descriptive statistics and correlation matrix

	N	MEAN	STD. DEV.	MIN	MEDIAN	P75	MAX

Table 1. Descriptive statistics. This table provides variable descriptive statistics as well as a summary of all variables. It contains 3634 observations from 161 countries spanning the years 1995 to 2020.

Table 1 depicts the descriptive statistics for all variables in our model from 1995 to 2020. The main independent variable ECON_FREE has a mean of 60.949 and a standard deviation of 10.279, with the minimum and maximum values being 15.6 and 90.5, respectively. The Financial development index shows a mean of 0.328 with a standard deviation of 0.237. Political stability index varies from -2.81 to 1.76, providing a mean of -0.031 and a standard deviation of 0.901. The population growth rate ranges from -5.28 to 19.36, with the mean and standard deviation being 1.409 and 1.496 sequentially. On average, countries in our sample have a GDP growth rate of 3.6% per year and inflation.

Table 2. Correlation coefficient matrix. This table provides the correlation coefficient matrix of the independent variables for our main model. The sample includes 3634 observations in 161 countries, for the period from 1995 to 2020.

The pairwise correlations between the independent variables in our main regression are reported in Table 2. The main independent variable ECON_FREE is connected with all of the control variables since the correlations between them are statistically significant at 1%. The association between Economic freedom overall score and the Political stability index is positive, while the data implies a negative relationship between the ECON_FREE and population growth. Such correlations suggest that nations that enjoy a high stage of economic freedom have greater levels of political stability and lower rate of population growth. We also receive a significant and negative correlation between Political stability index, which suggests that countries with higher levels of political stability tend to be involved with lower inflation rates. Because correlations between variables are quite small, multicollinearity is not a big issue in our model.

4.2. Baseline results: Economic freedom and foreign direct investment

Our estimations to test Hypothesis 1 are reported in Table 3. The findings of Eq.(2) are shown for the entire sample in models (1) and (2), while the results for the developing country subsample are illustrated in models (3) and (4). The findings for developed nations are depicted in the two last columns which are models (5) and (6). We do not include control variables in columns (1), (3), and (5).

After running the regression test, we discover that ECON_FREE and FDI are reported to have a beneficial relationship that is significant in both the entire sample and developing nations. These findings indicate that countries experience a higher level of FDI under the increase of economic freedom, which is consistent with a study of Quazi (2007). Figure 1 plots the fitted regression for the impact of economic freedom on FDI in developing countries. Specifically, we obtain country-level ECON_FREE and LOG(FDI) by taking the averages over the sample period. Consistent with the results from columns (3) and (4). The fitted regression line shows an upward-sloping trend in the relationship between economic freedom and foreign direct investment in developing countries.

As given in Models (1) and (2), the coefficients of ECON_FREE are 0.026 and 0.021, respectively, explaining approximately from 2.1% to 2.6% of FDI's growth with a one-unit increase in Economic freedom index when other factors are kept constant. This result bears similarity to the findings that economic freedom connects with FDI inflows positively in a study conducted by Imtiaz and Bashir (2017).

Based on our analysis in Models (3) and (4), nations with developing economies experiencing a one-unit index increment in ECON_FREE could enhance their performance in the range of 3.2%–3.5% in FDI, ceteris

paribus. However, the coefficients are witnessed to be insignificant for developed countries. This outcome is supported by several previous papers stating similar results by Saini & Singhania (2018) and Singh & Gal (2020).

Although we include both control variables and fixed effects that may capture time-invariant unobservable factors, the coefficients on ECON_FREE are not significant, even at 10%.

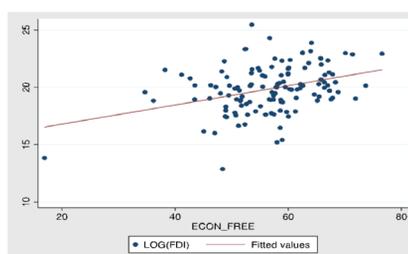

Figure 1. Economic Freedom and Foreign Direct Investment in developing countries. ECON_FREE is the proxy variable for economic freedom; LOG(FDI) is the natural logarithm of foreign direct investment. We obtain country-level ECON_FREE and LOG(FDI) by taking the averages over the sample period. The line shows an upward-sloping trend in the relationship between economic freedom and foreign direct investment in developing countries.

	Dependent Variable: LOG(FDI)					
	(1)	(2)	(3)	(4)	(5)	(6)
	Full	Full	Developing	Developing	Developed	Developed
ECON_FREE	0.026*** (3.037)	0.021** (2.239)	0.035*** (3.958)	0.032*** (3.208)	-0.038 (-1.384)	-0.035 (-1.283)
POP		0.078 (1.29)		0.103 (1.514)		-0.088 (-1.055)
UNEMPLOYMENT		1.235 (0.745)		0.651 (0.336)		3.575 (1.31)
PVE		0.289** (2.125)		0.264* (1.86)		0.411 (1.34)
URBAN		4.167*** (3.043)		2.889* (1.895)		3.816 (1.303)
INFLATION		0.018* (1.843)		0.019* (1.905)		-0.122 (-0.062)
CAPITA		0.224 (0.827)		0.051 (0.176)		0.941* (2.017)
GDPGROWTH		5.368*** (4.458)		5.57*** (4.245)		0.253 (0.141)
Observations	3634	3634	2775	2775	859	859
R-squared	0.821	0.832	0.781	0.795	0.77	0.775
Country FEs	Yes	Yes	Yes	Yes	Yes	Yes
Year FEs	Yes	Yes	Yes	Yes	Yes	Yes

Table 3. Economic freedom and Foreign direct investment. This table depicts the findings of effects of economic freedom on FDI. Models (1) to (6) describe the regression outcomes for each subsample (i.e., full sample, developing countries, and developed countries). The dependent variable for all specifications is LOG(FDI).

The given table also reports the impacts of control variables. URBAN and GDPGROWTH share the same significance level of 1% for the full sample. However, there is a significant difference in significance level in the subsample of developing countries. In the full sample, the coefficient of the urban population is 4.167, indicating that higher urban population results in properly increasing the FDI. A 0.01 percent-point increase in the ratio of urban population could lead to a rise of 4.167% in FDI, ceteris paribus. The same trend goes for the subsample of developing countries. Evidently, the more densely populated the nations are, the more attractive the area is to offshore investors. This is aligned with the study of He Canfei (2002), which stated that the greater the urban population, the greater the growth of FDI inflows. While URBAN remains at its significance level, the coefficient of GDP growth is only significant at 10% in the fourth column. The coefficients on GDP growth show that it has a positive linkage with FDI in developing nations.

As reported in Models (2) and (4), the coefficients and significance level for INFLATION share a resemblance. The statistically significant coefficients of PVE are 0.289 in the full sample and only 0.264 for the developing countries, showing that if other parameters remain constant, a one-unit index increase in political stability might lead to a 28% and 26% rise in FDI respectively. By contrast, population growth, unemployment rate, and GDP per capita all have no effect on FDI.

4.3. Endogeneity concerns

One may argue that our results suffer from endogenous problems. For example, although we included year and country fixed effects that capture time-invariant unobservable factors, omitted important variables that may influence both economic freedom and foreign direct investment. In addition, reverse causality raises another concern whether countries with high FDI inflows may increase their economic freedom status. To deal with issues, we employ two-stage systems generalised method of moments estimation developed by Blundell and Bond (1998). This model uses a dynamic perspective setting to address endogeneity concerns by solving unobserved heterogeneity and simultaneity. Specifically, it controls the lagged dependent variable in a model and employs lagged independent variables as instruments. To reduce the model's instrumental weakness, we limit the number of instruments by limiting the lag range used in their generation to three (Roodman, 2009). We also use the Hansen test and AR (2) test to make sure the validity of the model (Arellano and Bover, 1995). The results are reported in Table 4. We find consistent results that the coefficients on ECON_FREE are positive and statistically significant at 1% significance level for the full sample and developing countries. However, there is no significant impact of economic freedom on FDI in developed countries, even at 10% significance level. Overall, the results are robust and consistent with baseline results. Therefore, endogeneity caveats are not a big problem in our model.

	<i>Dependent Variable: LOG(FDI)</i>					
	(1)	(2)	(3)	(4)	(5)	(6)

Observations	3295	3295	2504	2504	791	791
Country FEs	Yes	Yes	Yes	Yes	Yes	Yes
Year FEs	Yes	Yes	Yes	Yes	Yes	Yes

Table 4. Endogeneity addressing. GMM approach. This table depicts the findings of effects of economic freedom on FDI, as estimated by the country fixed-effects model. Models (1) to (6) describe the regression outcomes for the full sample, and two subsamples (developing countries and developed countries). The dependent variable for all specifications is LOG(FDI). Standard errors are robust and clustered at the country level.

4.4 Cross-sectional tests: the role of financial development

Table 5 illustrates the statistical significance and how the effect of financial development implies on the relationship between economic freedom and FDI for the second hypothesis. We then define High_FD as a dummy variable that equals 1 for countries with high financial development. Specifically, a country is classified as high financial development if its index is greater than the yearly sample median, 0 otherwise. We then interact this variable with ECON_FREE, noting that the coefficients on the interaction terms reflect the moderating role of financial development on the EF - FDI linkage. If high financial development constrains the beneficial impact of economic freedom on FDI, we should expect the coefficient, $\beta_3\beta_3$ is negative and statistically significant.

Empirically, the result provides that financial development has a meaningful impact only on the relationship in full and developing countries samples. with the negative coefficients of 1% significance. Therefore, we conclude a less intense effect on the relationship in high-level financial development countries. Furthermore, Worldbank (2017) suggests that developing countries are believed to be more favorable for growth than developed countries. Taking column (4) of Table 5 as an example, the coefficient on ECON_FREE*HIGH_FD is -0.043 and statistically significant at 10%. In terms of economic magnitude, compared to low financial development countries, the positive impact of economic freedom on FDI is lower by 0.045 units for countries that have high financial development. This is consistent with the hypothesis that for countries with higher levels of financial development, available financing convenience and resources, the effect of economic freedom on FDI is less intense.

About control variables, similarly, we found that almost all the coefficients (except for capita) are statistically insignificant for the developed countries group. For the first 4 Models, many variables have similarities in significance level. Nonetheless, the coefficients of the Unemployment rate, Population growth, and GDP per capita are consistently insignificant for the two samples. It is explicit that, regardless of whether financial development is included, the consistency of most variables' coefficients changes only slightly.

	Dependent Variable: LOG(FDI)

Table 5. Interaction of economic freedom and financial development. This table reports the effects of economic freedom and FDI on the degree of financial development. Models (1) through (6) show the basic regression results for each of the examined samples (full sample, developing countries, and developed countries) with LOG(FDI) as the dependent variable.

5. CONCLUSIONS

Economic freedom has a beneficial impact on FDI, which is statistically significant across the board and in emerging nations. These data suggest that as economic freedom increases, countries see increasing levels of FDI. Yet, for industrialised nations, the coefficients are seen to be small. Remarkably, for wealthy nations, the influence of all factors on FDI is negligible, with the exception of GDP per capita. Finally, to increase the dependability of our results, we used the robust standard error check via the GMM technique, which shows that the favorable impact of economic freedom on FDI is more prominent in emerging economies. Generally, the findings are consistent with the baseline findings.

This conclusion could be very relevant; developing countries should continue their efforts to attract foreign direct investment by offering various investment incentives and increasing economic freedom. Greater trade openness appears to be an important tool for economic growth and another way for developing countries to support and encourage foreign direct investment. However, governments should weigh the costs of attracting FDI against the benefits of increasing economic freedom. Policies that promote greater economic freedom should precede measures aimed at attracting foreign direct investment, as greater freedom is likely to yield greater benefits. Before implementing other strategies to encourage higher levels of foreign direct investment, policymakers should develop procedures that are clear to potential investors.

Data collection was challenging, which is the main limitation of this study. The study only included 161 nations as a result due to the lack of data in some countries. The choice of control variables is also limited by this issue, which has an impact on the empirical findings of the study. The second problem is that our research estimates the aggregate measurement of FDI that may conceal the variety of MNEs' reactions to the institutional environment. The question of how a country's institutions between a host and a home country affect the FDI flow between them cannot be answered by looking at data on inward FDI that is only one way. Therefore, we see this article as a viable beginning point for analyzing the aspects that show to be critical for FDI, whether from an internal or external viewpoint. Future research will investigate the dynamic combination of all of these views.

THE BRIGHT SIDE OF CORRUPTION CONTROL IN THE AGE OF PRESS FREEDOM: EVIDENCE FROM CORPORATE ENVIRONMENTAL PERFORMANCE AROUND THE WORLD

**Author: Huynh Huu Thuy Tien¹, Nhan Khanh Linh¹, Tran Ngoc Minh Tam¹, Nguyen Minh Anh¹
Mentor: Le Anh Tuan¹**

ABSTRACT: Corruption is a severe problem, and social ethics significantly impact all societies. It is a global phenomenon defined broadly as using public power to benefit a private interest. It is a complex and multifaceted concept with numerous and significant economic and environmental implications. This paper examines the impact of control of corruption on corporate environmental performance. Using a large sample of 19,666 firm-year observations of 2,063 unique firms in 28 countries between 2003 and 2018, we find that control of corruption has a significant and positive impact on corporate environmental performance. Our findings remain econometrically sound even after controlling for the corruption-environmental performance relationship's inherent endogeneity and we also examine the cross-sectional analysis for the role of press freedom in our research. We provide evidence that press freedom strengthens the beneficial impact of corruption control on corporate environmental performance.

Keywords: corruption; corporate environment; press freedom

1. INTRODUCTION

In recent years, international organizations, national governments, nonprofit organizations, and other entities have regularly fought corruption due to its serious threats to political, economic, and social life. It's interesting since economic and social breakdown costs affect many groups. Investment and economic growth are mainly affected by these variables. The environment is one of corruption's most evident and harmful effects. Corruption harms the environment. Forestry, endangered species conservation, water supply, oil production, fisheries, and hazardous waste management are vulnerable to corruption (UNODC, 2015). Corruption happens at every level, from small-scale bribery of officials to grand corruption when permits and licenses for exploiting natural resources are issued. Additionally, corruption makes it possible to disregard or go through social and environmental regulations.

Even though corruption is a severe issue, there is not much research on how it affects corporate environmental performance. In this study, we fill the gap in the literature by investigating the impact of control of corruption on corporate environmental performance. Corrupt politicians, judges, attorneys, prosecutors, police officers, investigators, and auditors obstruct law enforcement, legal reform, and the impartial administration of justice in nations where corruption permeates the government and judicial systems.

The accountability systems responsible for preserving the environment are compromised by corruption in the rule of law establishment, which also fosters an atmosphere of impunity. Since crimes remain unpunished and may shift blame to innocent parties, remedies may thwart, and may not always enforce laws.

It is widely perceived that the extractive industries' environmental risks include pollution, dangers to biodiversity, greenhouse gas emissions, and land degradation. Extractive industries have environmental risks and also corruption risks. Lower revenue doesn't always mean less corruption. Corruption can negatively impact the environmental performance of firms. Corruption is more than simply individual activities; it is a wider issue that affects environmental stability and society. Policymakers should evaluate the implications.

¹ University of Economics Ho Chi Minh city.

Our research enriches the literature. The ASSET4 database's business Environmental Performance Index (Environment score) assesses emission reduction, product innovation, and resource reduction. Second, we examine the association between control of corruption and environmental performance using the Environment Score, Control of Corruption, and other country-level variables to ensure that omitted factors do not skew our findings. We also discover global corporate data. We also examine heterogeneities in the connection using country-level press freedom status. Thus, we examine press freedom's moderating effect on corruption and environmental performance.

We found a strong and positive association between corruption control and corporate environmental performance in an international sample of 19,666 firm-year observations of 2,063 unique businesses in 28 countries between 2003 and 2018. After resolving endogeneity using a two-stage least squares estimate with instrumental factors, the findings are robust. In nations without press freedom, corruption control has a less positive influence on business and environmental performance. Press freedom eliminates corruption and improves business environmental performance, as shown by this research.

After media reports of illegal telecom contract payments in Uzbekistan, Telia Corporation agreed to pay at most \$965 million in penalties to US and international authorities (Schoenberg & Dolmetsch, 2017). VimpelCom settled a 2016 case for \$835 million after a media probe into unethical payments. (Scannell, 2016). These examples show how important press freedom and investigative journalists are in uncovering and prosecuting wrongdoing. Current research suggests that press freedom is linked to perceived corruption and that media freedom may decrease corruption through stronger corporate governance.

Our study has five sections. Our paper proceeds as follows: The second part analyzes relevant literature, then we provide our assumptions concerning corruption, environmental performance, and press freedom. We will pick data, variables, and sample and develop the model in the third section. The fourth section presents descriptive statistics and empirical outcomes. Our study paper references are in the final part.

2. LITERATURE REVIEW

2.1. Corruption and environmental performance

In a developing economy, academics and legislators address environmental performance and quality. Human survival and economic prosperity depend on environmental performance. According to various classic studies, productive factor inputs and environmental shocks impact economic growth and development. For the former, Everett et al. (2010) indicate that outstanding environmental performance is an input of a better production component, typically resulting in more economic growth (Beckerman, 1992). The state could use cleaner energy and technology, limit trade openness, and modify the industrial structure to enhance environmental performance from an economic perspective (Grossman & Krueger, 1995; Press, 2007; Managi & Kumar, 2009). Corruption is as old as civilization. Since ancient Egypt, it has existed. It seems inevitable in human societies. The World Bank Group has been fighting corruption in its client states for almost two decades. Corruption may range from tiny payments to large-scale schemes in which high-level government officials make millions in unlawful revenues.

In China, over three-quarters of those polled thought corruption had worsened in the previous three years, implying that people do not believe the significant anti-corruption effort is succeeding. In 2017, governments worldwide prioritized inclusive development as people expressed worry about rising inequality, persisting poverty, and the exclusion of the most vulnerable. Asia Pacific countries must achieve sustainable and equitable development as a varied and fast-developing area. ("Corruption in Asia Pacific: What 20,000+ people told us," 2017).

Corruption's acceptance in many countries is the biggest problem. Corruption ripples across society, especially in developing nations, by diverting funds. Corruption-free enterprises grow 3% faster, according to the World Bank and Transparency.org. Corruption may be a 20% "tax" on business in certain countries. After the "tangentopoli" bribery scandal and punishment, city rail construction plummeted 52% and subway line building dropped 57%, respectively. The scandal reduced public construction project corruption, lowering construction costs. Illicit activities used most of these projects' public cash. (Turpeinen, 2020).

According to Judge et al. (2011), corruption indicators have been studied. Existing research has employed country-level corruption indices and addressed issues regarding perception-based indices (Abrate et al., 2015; Seim & Soreide, 2009). Corruption doesn't hurt the organization receiving the bribe, but it does hurt society via poor product quality or overcharging. Corruption has been linked to inefficient use of natural resources, improper land use, increased CO2 emissions, and misuse of infrastructure funding. Corruption affects the ecosystem, according to Cole (2007). Corruption affected environmental policy directly and indirectly. Corruption has positive environmental advantages, but its indirect effects are damaging. Corruption worsens air pollution, though. The model provides insight into setting a pollution tax in a protected industry within a political corruption environment and makes some accurate theoretical predictions.

The first prediction is that trade policy is preventative; trade liberalization raises (lowers) the pollution tax if public corruption is high (low). When there is little to no corruption (high), trade policy is anti-protective, and trade liberalization boosts (decreases) the pollution tax.

The second prediction is that reducing corruption makes pollution tax increase. Government is more accountable for social welfare when there is less corruption in the system. Due to this, there will be a significant difference between the environmental tax and the Pigouvian tax, a tax on market transactions that imposes a surcharge on those not directly affected by the trade.

The third prediction is that environmental policy will respond positively to growing environmental demand. It is true that this technique would increase environmental demand, but only if the level of corruption remained constant. Organized groups will have minimal influence on environmental policy in countries with high levels of corruption since such policies are made from and for bribes.

We tested our theoretical premise using panel data from 28 developing and developed nations. Regression estimates provide support for our theoretical model's fundamental assumptions. Corruption and environmental policy were examined empirically by Pellegrini (2003). Institutions predict income levels. It also shows that as prosperity grows, institutional quality will lead to stronger environmental legislation. The U-shape Environmental Kuznets Curve (EKC) was introduced by Grossman and Krueger (1991) to show a correlation between production and environmental quality. Commerce increases emissions by 10%, according to Grether et al. (2007). Birdsall and Wheeler (1992) agreed that "imported" environmental rules from affluent and industrialized nations boosted clean sector development in developing economies.

Based on several pieces of evidence, we expect a positive relationship between control of corruption and corporate environmental performance. Therefore, we propose our first testable hypothesis as follows:

Hypothesis 1: Control of corruption is positively associated with corporate environmental performance.

2.2. The role of press freedom

Press freedom and corruption go hand in hand (Kalenborn & Lessmann, 2013; Norris, 2004). Brunetti and Weder (2003) use cross-country data from 125 countries between 1994 and 1998 to support

their thesis that press freedom may curb corruption. On a scale of 0 to 6, enhancing press freedom by one standard deviation decreases corruption by 0.4–0.9 points. Strong press freedom helps lower a nation's corruption, according to a study. Ahrend (2002) provides further empirical evidence that a lack of press freedom increases corruption. Freille, Haque, and Kneller (2007) examine the relationship between media freedom and corruption by differentiating between political, legal, and economic constraints. Their results suggest that political boundaries affect corruption more than legal limits. FOIL legislation has also been linked to lower corruption (Islam, 2006). According to Nam (2012), states adopting FOIL must consider media freedom and corruption. According to Camaj (2012), “the link between media freedom and corruption is stronger in countries with parliamentary systems than in those with presidential systems.” The media's economic independence and competition also help fight corruption (Suphachalasai, 2005). Government media ownership is strongly linked to corruption, according to Djankov, McLeish, Nenova, and Shleifer (2003).

Press freedom's potential to fight corruption is plausible. Becker's (1968) model of crime states that criminals assess the anticipated benefits against the projected costs. According to this notion, increasing penalties or detection deters criminals. Independent media should discourage crime by increasing the probability of detection. These people are either public officials who demand bribes from companies or firms that offer fixes in return for favorable treatment, either via collusive corruption or in reaction to extortion. The press policies corruption with the idea that these individuals are alert to even little changes in detection. In an experimental bribery game, Abbink et al. (2002) demonstrate that the low chance of detection and hefty punishment considerably limit the probability of offering or taking a bribe. The higher the danger of discovery for bribery, the fewer businesses engage.

Hypothesis 2: The positive effect of control of corruption on corporate environmental performance is less pronounced for firms in non-press-freedom countries.

3. METHODOLOGY

3.1. Data selection

Compustat North America and Compustat Global are our primary data sources for firms' accounting data. The sample for this paper was chosen primarily based on the availability of reliable data. Our sample includes developed, developing, emerging, and least developed countries worldwide. These countries' economic development and geographic area meet the requirements for spatial analysis. We then merge it with corporate environmental performance data from the Thomson Reuters ASSET4. Our main independent variable, control of corruption, is collected from the Worldwide Governance Indicators. Country-level variables such as GDP per capita and inflation are collected from the World Bank database and press freedom from the Freedom House.

Following previous studies, we exclude firms that have negative total assets and firms in utilities (SIC codes 4900 – 4999) and financial industries (SIC codes 6000-6999). All continuous financial variables are consolidated at 1% and 99% of the distributions to reduce the influence of outliers. After dropping firm-year observations with missing values, our final sample includes 19,666 firm-year observations of 2,063 unique firms in 28 countries between 2003 and 2018.

3.2. Model

3.2.1. Basic model

To study how corruption affects environmental performance, we build the basic model as follows:

$$\begin{aligned}
 \text{Environment score}_{i,j,t} = & \beta_0 + \beta_1 \text{Control of Corruption}_{j,t} + \alpha' \text{Country Controls}_{j,t} \\
 & + \delta' \text{Firm Controls}_{i,j,t} + \text{Industry fixed effects} \\
 & + \text{Year fixed effects} + \mu_{i,j,t}; \quad (1)
 \end{aligned}$$

where our main dependent variable (*Environment score*_{*i,j,t*}) is the indicator for the environmental performance for firm *i* country *j* in year *t*. *Control of Corruption*_{*j,t*} captures the corruption control level in a given country *j* in year *t*.

*Firm Controls*_{*i,j,t*} are a set of firm-level control variables, including *ROA*, *Size*, *Sales Growth*, *Leverage*, *Tangible*, *Intangible*, *Market-to-book*. Additionally, *Country Controls*_{*j,t*} including *Inflation*, which is gauged by the annual inflation rate (GDP deflator); and *GDP per capita*, shows a country's GDP divided by its total population. Section 3.2.2 and Table 1 both provide definitions for these variables. We also add industry dummies to capture all time-invariant industry-level parameters that may be related to both the level of corruption control and environmental performance. Furthermore, we account for the time-fixed impacts of common macroeconomic shocks. For all specifications, the standard errors are heteroskedasticity-resistant and clustered at the country level. It is worth noting that 1 in equation (1) captures the impact of corruption control on environmental performance. One would anticipate 1 to be positive if eliminating corruption causes firms in a specific country to enhance their environmental performance.

3.2.2. Variables and data sources

a) Measurement of Corporate Environmental Performance

We use environmental performance scores from the Thomson Reuters ASSET4 database to measure our key dependent variable, as in prior studies (Ioannou & Serafeim, 2012; El Ghoul et al., 2017). A higher environmental performance score suggests greater risk-reduction techniques. Emission reduction, product innovation, and resource reduction are all major aspects of environmental performance. An objective to reduce emissions, for example, may boost the environmental score. A unique environmental pillar score goes from 0 to 100, with higher values indicating greater environmental performance. We rescale this variable, *Environment score*, to a new scale ranging from 0 to 1 in order to better grasp the regression results proposed by Cheng et al. (2014). Higher *Environment score* values indicate improved environmental performance.

b) Measurement of Control of Corruption

Though public opinion of corruption has increased in recent years and researchers are interested in it (Transparency International, 2010a, p. 3), cross-national studies on the corruption issue date back decades (Scott, 1969, 1972). According to the literature, one of the main drivers of the global phenomenon of states globally implementing access-to-information legislation is corruption (Roberts, 2006, p. 110). Because public usage of access-to-information legislation leads to holding the government accountable for its activities (Birkinshaw, 2010), it has been claimed that access-to-information legislation may be “a tool that can be used to gain accountability” in government (Piotrowski, 2008, p. 10).

Following Nguyen et al. (2015) and Le et al. (2021), we use the Worldwide Governance Indicators control of corruption index as our main independent variable. The control of corruption index measures how much public power is utilized for private gain, including both petty and grand corruption, as well as the “capture” of the state by elites and private interests. It also examines a country's anti-corruption policy and institutional framework's strength and effectiveness. Control of Corruption has a range of -2.5 to 2.5; higher numbers indicate stronger corruption control.

c) Measurement of Control variables

We also include a rich set of firm-level and country-level control variables that are commonly used in the literature to prevent omitted factors from skewing our results.

In terms of company controls, we include *ROA*, which is the net income-to-total-assets ratio. Myers and Rajan (1998) contend that liquid assets are the least expensive option for managers to earn personal rewards. Profitable organizations with more cash flow motivate managers to be more opportunistic, which leads to more corruption (Jensen & Meckling, 1976). *Size* is calculated using the log of total assets at the end of the fiscal year. The link between business size and corruption is murky. On the one hand, when larger enterprises become involved with more businesses, the business becomes more complex and dangerous, increasing the chance of fraud and corruption. Large firms, on the other hand, are investigated intensively by the media and the general public, which can limit managers' ability to abuse authority and engage in corruption (Dyck et al., 2008).

We also follow Faccio et al. (2011) and Coles et al. (2006) and adjust for the effects of sales growth since firm sales growth and cash holdings behavior are anticipated to have direct effects on risk performance (*Sales Growth*), the percentage growth of sales over a sixteen-year period. Furthermore, because the leverage proportion is important in firm-level risk (Huang & Wang, 2015; Gande & Kalpathy, 2017), we include the *Leverage variable*, which is calculated as the sum of total debt in current liabilities and total long-term debts scaled by total assets; and *Tangible*, which is the ratio of tangible assets to total assets. *Intangible*, which is the ratio of intangible assets to total assets, is also included. To capture growth opportunities, we include *Market-to-book*, which is the market-to-book ratio.

Regarding country-level controls, we include the natural logarithm of real GDP per capita (*GDP per capita*). We also use *Inflation*, which is measured by the annual inflation rate (GDP deflator).

Table 1. Variable Definitions

Variable	Description	Source
Environment score	Environmental performance scores. A higher environmental performance score indicates higher corporate environmental performance	Thomson Reuters ASSET4 database
Control of Corruption	Corruption management. The control of corruption index measures how often public power is utilized for private gain. Higher levels indicate less corruption.	Worldwide Governance Indicators
ROA	Ratio of net income before extraordinary items or preferred dividend to total assets	Federal Reserve Economic Data
Size	Logarithm of total assets in millions	Federal Reserve Economic Data
Sales Growth	Annual growth of net sales	The World Bank
Leverage	Ratio of total liabilities to total assets.	The World Bank
Tangible	Ratio of tangible assets to total assets.	Federal Reserve Economic Data
Intangible	Ratio of intangible assets to total assets.	Federal Reserve Economic Data
Market-to-book	Ratio between its market value and its book or equity value	Federal Reserve Economic Data
GDP per capita	The logarithm of GDP per capita.	World Development Indicator
Inflation	The inflation rate determined by each nation's GDP deflator index.	World Development Indicator

4. EMPIRICAL RESULTS

4.1. Descriptive statistical analysis

Table 2 shows the descriptive statistics for the main variables, which include mean, standard deviation, median, 25th, and 75th percentiles from 19,600 firm-year observations. The mean and median of the

Environment score are 0.426 and 0.411, respectively. As indicated in Table 3, the Netherlands has the highest Environment score of 0.629, but this has little impact because the amount of observations from this nation accounts for only 0.051% of the total of 28 countries. In terms of Control of Corruption, the mean is relatively high (1.188). This is due to the fact that the United States and Japan have the most observations, accounting for 23.467% and 25.47%, respectively, and their levels of corruption control are generally outstanding, at 1.416 and 1.42, respectively.

The pairwise correlation between independent variables is seen in Table 4. At the 1% level, we find a positive and statistically significant relationship between Control of Corruption and Environment score. According to this study, corporations in high-corruption countries will improve their environmental performance. Furthermore, it revealed a moderate association, but it was not severe enough for the researcher to seek corrective measures, equating to a variance inflation factor of roughly 2.24 (unreported in the table). According to our calculations, there is no possibility of multicollinearity.

Table 2. Summary statistics

	N	Mean	Std. Dev.	P25	Median	P75
Environment score	19,666	0.426	0.252	0.216	0.411	0.628
Control of Corruption	19,666	1.188	0.775	1.211	1.397	1.695
ROA	19,666	0.055	0.098	0.022	0.052	0.094
Size	19,666	9.974	2.994	7.735	9.398	12.612
Sales Growth	19,666	0.126	0.370	-0.007	0.069	0.173
Leverage	19,666	0.207	0.164	0.066	0.189	0.314
Tangible	19,666	0.265	0.190	0.118	0.227	0.367
Intangible	19,666	0.134	0.175	0.011	0.047	0.202
Market-to-book	19,666	2.613	2.221	2.042	2.175	2.441
GDP per capita	19,666	10.291	0.961	10.543	10.713	10.797
Inflation	19,666	0.018	0.024	0.001	0.017	0.027

This table provides a descriptive statistic for all variables, with 19,666 firm-year observations from 28 countries from 2003 to 2018. Table 1 contains the definitions of the variables.

Table 3. Descriptive statistics by countries

	N	Percent	Firms	Environment score	Control of Corruption

This table provides the correlation coefficient matrix of the main independent variables. The sample includes 19,666 firm-year observations in 28 countries over the 2003–2018 period. The definitions of the variables are provided in Table 1. (***) $p < 0.01$, (**) $p < 0.05$, (*) $p < 0.1$

4.2. Baseline Results

The impact of corruption control on environmental performance is investigated using a static panel data model. The sample studied includes enterprises from 28 countries, with data ranging from 2003 to 2018. The random effects model was rejected when the Hausman test was used to compare it to fixed effects models. As a result, as illustrated in equation (1), a fixed effects panel data model is adopted.

Table 5 shows the regression findings for the principal analysis as indicated in the basic model. We employ a variety of control combinations. Column (1) is our naive model because it lacks control variables and fixed effects. Column (2) includes firm-control and country-control variables, but we also account for industry fixed effects and year fixed effects. In Column (3), we list the control variables and year fixed effects. For the last column, we aggregate all of the independent variables and the set of fixed effects. Column (4) has the highest R-squared in terms of goodness-of-fit, highlighting the importance of controlling heterogeneity in the independent variables.

Across the model specification, the *Control of Corruption* coefficients are positive and statistically significant at 1%, indicating that increasing the level of control of corruption leads to improved environmental performance in firms in a given country. Keeping all other variables constant, a one-point improvement in the level of corruption control boosts the *Environment score* by 0.034 points on average. In terms of economic significance, a one standard deviation increase in *Control of Corruption* improves environmental performance by 6.2% over the sample mean. The findings corroborate Hypothesis 1, suggesting that anti-corruption efforts improve environmental performance. As a result, our findings are consistent with those of Lv, Z., and Gao, Z. (2021), who demonstrated that the cumulative impacts of corruption on environmental performance are negative and statistically significant.

Turning to control variables, we observe that the signs are quietly consistent with prior studies. Specifically, according to the findings of Aulia and Agustina (2015), Hadjoh and Sukarta (2013), and Effendi et al (2012), *firm size* has a strong beneficial effect on environmental performance. *ROA* is positive and statistically significant at 1% for models (2), (3), and (4). It is consistent with prior research by Aulia and Agustina (2015) that found profitability had a significant and favorable impact on environmental performance. In addition, other variables' sign and statistical significance are positive for *Leverage*, *Tangible*, *Intangible*, and *Market-to-book* but negative for *Sales Growth*. At the 1% level, the effect is statistically significant and positive in terms of *GDP per capita* and *Inflation* for country-control variables.

Table 5. Control of corruption and Corporate environmental performance

Dependent variable: Environment score				
	(1)	(2)	(3)	(4)

GDP per capita		0.035*** (8.225)	0.042*** (9.767)	0.043*** (10.168)
Inflation		1.236*** (14.032)	1.484*** (16.257)	1.319*** (14.653)
Constant	0.382*** (116.847)	-0.391*** (-9.891)	-0.46*** (-11.544)	-0.485*** (-12.337)
Observations	19,666	19,666	19,666	19,666
R-squared	0.013	0.170	0.183	0.232
Industry Fixed Effects	No	No	No	Yes
Year Fixed Effects	No	No	Yes	Yes

This table displays the results of a test to see how corruption affects environmental performance. For all specifications, the environment score is the dependent variable. Table 2 contains the definitions of the variables. Except for Column (1), the models contain year fixed effects. Robust standard errors are used to calculate the coefficient estimates and t-statistics. *, **, and *** indicate statistical significance at 10%, 5%, and 1%, respectively.

4.3. Endogeneity Concerns

The possibility of endogeneity in the two-way interaction between corruption and environmental performance influences internal validity. An IV estimation using two stage least squares (2SLS) is performed to overcome this issue. It should be highlighted that IV estimation is less prone to misspecification and yields more consistent estimators. The first stage is to find a legitimate instrument (Z) for corruption that is both exogenous and relevant, as expressed by the following two conditions:

- i. $Cov(Z, \mu) = 0$
- ii. $Cov(Z, Corr) \neq 0$

It is critical to notice that the first requirement is difficult to assess because there is no unbiased estimator. As a result, in this scenario, researchers rely on their economic intuition. The second criterion, on the other hand, can be tested. The relevance of the instrumental variable to satisfy condition (ii) is tested by running an auxiliary regression in which corruption is regressed on its instrument as well as all other environmental performance variables. If the instrument’s coefficient is significant, the instrument is relevant. The initial stage of the regression procedure. The environmental performance is then regressed on all explanatory variables that are instrumented on itself, with the exception of corruption, which is instrumented on Z in a 2SLS estimation.

It is crucial to note that the government integrity index is used as a corrupting weapon (Z). In environments with low government integrity, corporate governance reasoning deviates from values of accountability, responsibility, and openness for company executives. Previous research backs up this assertion. According to Keig et al. (2015), firms that create and sustain operations in portfolios of places with greater degrees of corruption are more likely to engage in irresponsible behavior, as such environments may allow or even encourage corporate executives to avoid socially responsible behavior. As a result, there is strong evidence that the government integrity index can be used to facilitate corruption.

The results of the first stage regression IV regression are shown in Column (1) of Table 6. Government Integrity coefficients are both positive and significant, adding support to our premise that countries with high government integrity have better corruption control. Furthermore, the Cragg-Donald Wald F-statistic is 33.001, indicating that the null hypothesis that our instrumental variables are weak is rejected. In column (2), we regress the *Environment score* against the fitted value of *Control of Corruption* from the first-stage regression. For the *Environment score*, the *Control of Corruption* (fitted) coefficient remains positive and significant. These data imply that improved corruption control leads to a higher *Environment score*.

Table 6. Two-stage least squares estimation (2SLS)

	(1)	(2)
	Control of Corruption	Environment score
<i>Control of Corruption (fitted)</i>		0.049*** (3.274)

Government Integrity	0.041*** (25.277)	
ROA	-0.027** (-2.27)	0.173*** (10.049)
Size	-0.006*** (-13.898)	0.035*** (54.13)
Sales Growth	-0.004 (-1.199)	-0.041*** (-8.964)
Leverage	0.005 (.676)	0.081*** (7.41)
Tangible	0.042*** (4.811)	0.02 (1.621)
Intangible	0.055*** (6.732)	0.158*** (13.424)
Market-to-book	-0.004*** (-7.082)	0.005*** (6.263)
GDP per capita	0.119*** (41.808)	0.054*** (11.575)
Inflation	1.579*** (24.973)	1.374*** (15.05)
Constant	-2.801*** (-12.871)	-0.597*** (-14.021)
Observations	19,437	19,437
R-squared	0.961	0.24
Cragg-Donald Wald F statistic	33.001***	
Industry Fixed Effects	Yes	Yes
Year Fixed Effects	Yes	Yes

This table reports the regression results of control of corruption on environmental performance addressing endogeneity. Columns (1) – (2) estimate the two-stage least square estimation. In all models, the *t*-values are computed for the heteroskedasticity-robust standard errors at the country level. The definitions of the variables are provided in Table 1. ***, **, and * denote significance at the 1%, 5%, and 10% levels, respectively

4.4. Cross-sectional Analysis

We also investigate how press freedom influences the relationship between corruption and environmental performance (Hypothesis 2). For all regressions, we use the same set of control variables as in equation (1), as well as the interaction factors between control of corruption and no press freedom (*Control of Corruption*No Press Freedom*). We use country-level statistics from the Freedom House database on the “Freedom of the Press” index. Each country is rated as Free, Partly Free, or Not Free. For each year, we define the dummy variable No Press Freedom, which takes 1 if a country’s status is Not Free. We estimate the following model to test Hypothesis 2:

$$\begin{aligned}
 \text{Environment score}_{i,j,t} = & \beta_0 + \beta_1 \text{Control of Corruption}_{j,t} + \beta_2 \text{No Press Freedom}_{j,t} + \\
 & \beta_3 \text{No Press Freedom}_{j,t} * \text{Control of Corruption}_{j,t} + \\
 & \alpha' \text{Country Controls}_{j,t} + \delta' \text{Firm Controls}_{i,j,t} + \\
 & \text{Industry Fixed effects} + \text{Year fixed effects} + \mu_{i,j,t} \quad (2)
 \end{aligned}$$

All of the coefficients of the interaction terms in Table 7 are negative and statistically significant at 1% level, which is consistent with our prediction. This suggests that firms in non-press-freedom countries will have worse environmental performance (higher *Environment score*). These findings support the assumption that the beneficial association between *Control of Corruption* and environmental performance is less pronounced for firms in countries with no press freedom. In order to achieve the required accountability within a system, which enhances openness, reduces information asymmetry, and creates stronger monitoring capacity, a free and independent press (free of government or private democratization strongholds) is crucial (Dutta and Roy, 2016). According to research, this function makes a free press an effective tool for combating corruption (Brunetti and Weder, 2003; Chowdhury, 2004; Freille et al., 2007). Our data thus support Hypothesis 2, which asserts that firms in press-free nations perform worse for the environment because corruption is more tightly controlled than firms in press-free countries.

Table 7. Interaction between Control of Corruption and No Press Freedom

Dependent variable: Environment score		
	(1)	(2)
Control of Corruption	-0.02*** (-6.474)	-0.023*** (-3.931)
No Press Freedom	-0.312*** (-15.508)	-0.219*** (-11.145)
Control of Corruption*No Press Freedom	-0.110** (-2.279)	-0.206*** (-4.460)
ROA		0.173*** (10.037)
Size		0.03*** (43.257)

Year Fixed Effects	Yes	Yes

*Interaction of corruption and press freedom. This table reports the effects of corruption and environmental performance conditional on the level of press freedom. The definitions of the variables are provided in the Table 1. ***, **, and * denote significance at the 1%, 5%, and 10% levels, respectively*

5. CONCLUSION, IMPLICATIONS AND LIMITATIONS

We used panel data with 19,666 firm-year observations from 2003 to 2018 to investigate the relationship between corporate environmental performance and corruption control. To further account for potential endogeneity, the 2SLS technique is utilized, and the industry fixed effect and year fixed effects are controlled for using the fixed effects estimator for static panel data. Several inferences can be drawn from our empirical data. Corruption control is an important factor in determining corporate environmental performance. It has a consistent, significant, positive, and essentially stable effect across all empirical estimators and specifications. As a result, our findings on corruption confirm previous research by Lv, Z., and Gao, Z. (2021), who discovered it to be a key determinant in environmental performance.

To progress sustainable development, relevant policy implications that take these findings into consideration must be established. To eliminate corruption, laws must be strictly enforced. It is critical to have clear standards with all necessary information put down in rules and regulations. The public's access to this information is critical since people occasionally break the law without realizing it. In order to do this, incentives and sanctions will be utilized to encourage compliance. Second, using the media to inform the public about those discovered to be corrupt.

Our study, however, has several drawbacks. Using data from corporations in 28 different countries, our study only examines the total impact of corruption control on corporate environmental performance. Future studies may investigate and compare the influence of corruption control on business environmental performance by group countries. Furthermore, our research focuses on the firm-level link between corruption control and environmental performance. Future study may analyze this association using country-level parameters.

IMPACT OF CREDIT POLICY ON IMPROVING VIETNAMESE HOUSEHOLD LIVING STANDARDS IN THE TIME OF COVID-19 PANDEMIC

**Author: Vo Minh Quan¹, Vo Thanh Thang¹, Vo Huynh Bao Nguyen¹,
Vu Ngoc Quynh Nhu¹, Pham Nhut Hao¹**

ABSTRACT : This paper explores how credit policy impacts the living standards of Vietnamese households during the COVID-19 pandemic using panel data from the Vietnam Household Living Standard Survey (VHLSS) in 2018 and 2020. By employing the Difference-in-Differences (DiD) method along with Propensity Score Matching (PSM), this study specifically examines the effect of formal credit on household income in Vietnam. We find strong evidence that timely and efficient credit assistance during the pandemic significantly improves the living conditions of all households. Credit enables households to invest in crucial areas like education and living standards, which is important in combating the pandemic. The finding emphasizes the need to consider geographical factors when designing accessible and effective credit policies. These results provide principles for achieving the policy goals of enhancing household well-being and addressing future shocks.

Keywords: credit policy, household income, household living, COVID-19, DiD, PSM

1. INTRODUCTION

Credit is a critical financial resource that enables households to overcome barriers, participate in markets, and adopt modern technologies. It has been widely recognized for its positive impacts on productivity, living standards, poverty reduction, and welfare equality (Abosedra et al., 2016; Clarke et al., 2006; Guirkingner and Boucher, 2008; Liverpool and Alex, 2010; Shahbaz et al., 2015; Thanh et al., 2019). Consumer credit serves as a means to enhance household consumption and address temporary financial gaps. Additionally, credit plays a crucial role in meeting basic needs, such as food, clothing, and healthcare, particularly for lower-income households.

Vietnam, as a developing country in Southeast Asia, presents a particularly relevant case for the above issues. Access to credit has been a significant barrier to agricultural production in rural Vietnam, which is home to about 66.90% of the population (GSO, 2014). The COVID-19 pandemic adversely affected industries like manufacturing, tourism, and retail trade, resulting in limited credit availability and slow GDP growth (GSO, 2020). This study aims to fill gaps in the literature by investigating the impact of credit on households before and during the pandemic, shedding light on its role in enhancing living standards during difficult times.

This paper investigates the impact of COVID-19 on credit access in Vietnam and its effect on household living standards. First, we analyze the empirical evidence to understand how credit policies support Vietnamese households during the pandemic. Most importantly, we examine public confidence and trust in government responses to COVID-19, considering the perception and experiences of the Vietnamese people. Using nationwide household-level data from 2018-2020, we employ DiD and PSM techniques to compare Vietnam's socio-economic status before and during the pandemic.

Our analysis reveals a significant relationship between credit access and household income, particularly for the region variable. While credit positively impacts urban income with a 13% growth, its effect on rural income

¹ University of Economics Ho Chi Minh city.

is limited. From a policy perspective, our findings underscore the transformative role of credit in empowering households and driving economic growth. The finding also emphasizes the necessity of incorporating geographical considerations when formulating credit policies that are accessible and impactful.

The study is structured as follows: Section 2 presents the theoretical background on credit, income, formal credit relations, and farmers' income, with a summary of previous empirical studies. Section 3 describes the research methodology and data description. Section 4 shows the discussion of results. Section 5 is the conclusion.

2. THEORETICAL FRAMEWORK

2.1. Credit

Credit holds significant importance as a source of finance for households, particularly in developing nations. The coexistence of formal and informal credit is a common characteristic of the credit industry in these countries (Guirkinger and Boucher, 2008).

In Vietnam, the recognition of rural credit's significance has grown. Studies by Manh Hao (2005) and Cuong (2008) highlight the positive impact of credit on poverty reduction. Access to formal financial services tends to favor wealthier households, but credit plays a crucial role in reducing poverty. However, these studies did not thoroughly examine the distributional effects of rural credit among different recipient groups. Credit also helps individuals in Vietnam smooth their consumption patterns over time, bridging the gap between income and desired spending for a more stable standard of living.

2.1. Theory of access to credit

Access to capital can be generalized as a sequential two-step decision-making process that starts on the demand side and then goes on the supply side. Households' access to rural credit markets can be simply defined as approaching credit services. Subsequently, access to credit is measured by the largest amount of money households can borrow (Diagne and Zeller, 2001). Access to rural credit in some papers is defined as the difficulty of capital access by poor households.

The determinants of credit access can be divided into observable and unobservable factors. Observable factors have been identified in numerous studies in many developing countries. Household income, family size, bank distance, loan duration, loan processing, interest rate, and loan size were the main factors affecting households' credit accessibility in the Philippines (Chandio and Jiang, 2018).

In addition to observable factors, unobservable factors play a significant role in credit access. These factors, such as social capital and social networks, are difficult to measure but have been observed to impact farmer's credit rationing and constraints. For instance, social capital enhances credit access by increasing information availability, and reducing opportunistic behavior within networks (Fukuyama, 2001).

2.2. Formal credit relations and farmers' income

Credit access significantly impacts rural households, increasing income, reducing poverty, and improving welfare equality (Imai et al., 2010; Imai and Azam, 2012; Li et al., 2016). Constrained households without credit experience lower farm productivity (Guirkinger and Boucher, 2008). Moreover, it enables households to better cope with shocks and pursue successful livelihood alternatives (Diagne and Zeller, 2001; Tung et al., 2020). Despite positive associations between institutional credit access and productivity growth among subsistence food crop farmers in Nigeria, challenges in accessing credit hinder efforts to enhance production, income, and well-being, impeding poverty reduction (Olagunju, 2007).

2.3. Conceptual model

Based on the literature review, **Figure 1** respectively represents the comprehensive research model with variables affecting access on credit and household income.

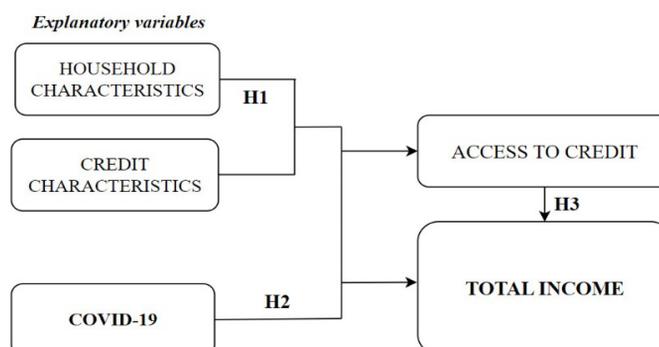

Figure 1. The theoretical framework for accessing credit and determinants affecting the household income.

Although the studies above all attempt to estimate the impact of credit, they do not sufficiently discuss the distributional effects of credit on various geographical factors. Hypotheses are built based on evidence from previous studies to better clarify the research problem and the relationship of the theories. At the same time, we apply logical economic theories to reinforce the role of credit policy. Therefore, the paper aims to examine three hypotheses constructed as follows:

Hypothesis 1: The differences of households characteristics impact on credit access.

Access to credit can be generalized as a sequential decision-making process that starts with the demand side, followed by the supply side. This is a standard framework analyzing credit accessibility (Thanh et al., 2019). Factors affecting household accessibility to applied credit include basic household characteristics such as individual-level characteristics (age, marital status, gender, education), occupation, ethnicity, household level (household size, living area), regional level (geographical location) (Duong and Izumida, 2002).

Hypothesis 2: COVID-19 is an obstruction of accessing on credit.

The emergence of COVID-19 raises concerns about its repercussions on households. Specifically, this study questions the adverse impact of COVID-19 on credit access for households, as the pandemic brings about undesirable global constraints.

Hypothesis 3: Credit has a positive impact on the total income of households in calamity.

According to prior studies, credit increases financial stability, asset growth, health, food security, nutrition, education, women’s suffrage, housing, job creation, poverty reduction, and social cohesion. In addition, credit improves productivity and raises living standards by breaking the vicious cycle of poverty and positively impacting incomes (Thanh et al., 2019).

3. RESEARCH METHODOLOGY

3.1. Empirical approach

3.1.1. Analyze the factors affecting on access to credit

To determine the factors influencing household access to credit, we examine the characteristics that affect credit accessibility for households before and during the pandemic. A linear probability model is employed to estimate this relationship. This model allows for identifying variables that affect credit access

for Vietnamese households, shedding light on the factors that shape credit availability in urban and rural areas during the COVID-19 period.

$$\Pr(\mathbf{CR})_i = \alpha_0 + \alpha_1 \mathbf{HC}_i + \alpha_2 \mathbf{CC}_i + \alpha_3 \mathbf{CV}_i + \varepsilon_i$$

where $\Pr(\mathbf{CR})$ is probability of accessing credit for a household, while \mathbf{HC} is a vector of observed household characteristics (e.g., household size, regional dummies, gender of respondents). \mathbf{CC} is a vector of observed credit characteristics, including loan value, loan interest rate, and collateral assets. \mathbf{CV} is a dummy variable indicating whether the household was infected with COVID-19 in 2020.

3.1.2. Difference-in-Differences

Based on the estimation model proposed by Lechner (2011), this study extends the model by incorporating the Difference-in-Differences (DiD) approach as follows:

$$\mathbf{hhinc}_{it} = \delta_0 + \delta_1 \mathbf{CR} + \delta_2 \mathbf{T} + \delta_3 (\mathbf{CR} \times \mathbf{T}) + \delta_4 \mathbf{HC}_{it} + \delta_5 \mathbf{CC}_{it} + \delta_6 \mathbf{CV}_{it} + \gamma_{it}$$

where \mathbf{hhinc}_{it} is the total income of household it in year tt , measured in million dong. \mathbf{CR} is a dummy variable that equals 1 if the household has access to credit (referred to as the Treatment group), otherwise equals 0 if the household has no access to credit (Control group). \mathbf{T} is a dummy variable indicating the survey time, equal to 1 for 2020 and 0 for 2018. $\mathbf{CR} \times \mathbf{T}$ is the interaction between \mathbf{CR} and \mathbf{T} capturing the effect of the credit policy, with δ_3 is the estimator for the DiD approach (as summarized in **Table 1**).

Table 1. Summary of DiD estimation.

	2018	2020	Difference
Treatment Group	$\delta_0 + \delta_1$	$\delta_0 + \delta_1 + \delta_2 + \delta_3$	$\delta_2 + \delta_3$
Control Group	δ_0	$\delta_0 + \delta_2$	δ_2
Difference-in-Differences Estimation			δ_3

Source: Synthesis of the authors

3.1.3. Propensity Score Matching

Propensity Score Matching (PSM), originally developed by Rosenbaum and Rubin (1983) and further refined by Becker and Ichino (2002) and Dehejia and Wahba (2002), is a commonly used method to evaluate the effectiveness of projects or policies. We employ PSM in this study to estimate the impact of credit policy by comparing households with (treatment) and without (control) access to credit. The PSM procedures involve: First, use the Logit model to identify the factors affecting credit accessibility. Then, calculating propensity scores. Ensuring balance and common support zone between two groups and matching observations on similar scores. Finally, calculating the average difference in outcomes to determine the credit policy's effect. To address bias and obtain accurate standard errors, we employ a bootstrap method.

3.1.4. Combining PSM – DiD

The PSM-DiD method combines two methods: Propensity Score Matching (PSM) is a quasi-experimental method, and Difference-in-Differences (DiD) is a statistical technique. This approach is specifically applied to panel data. By integrating PSM and DiD, the PSM-DiD method reduces estimation bias and provides more accurate results.

Applying the PSM-DiD method involves the following steps: Step 1: Calculating the propensity score. Step 2: Testing for the balancing property and determining the common support region. Step 3: Matching treatment and control groups based on the propensity score.

By applying DiD estimation within the matched groups, the PSM-DiD method estimates the effect of the credit policy. The equation for evaluating the credit policy using PSM-DiD can be expressed:

$$ATT = [\Delta hhinc_{1i}|p(HC_i), CR = 1] - [\Delta hhinc_{0i}|p(HC_i), CR = 0]$$

where ATT is Average Treatment effects on the Treated. $\Delta hhinc_{1i}$ and $\Delta hhinc_{0i}$ are respectively estimated between Treatment group and Control group in year tt .

3.2. Data

This study follows a systematic approach by selecting appropriate variables and models based on the research method. The variables corresponding to each characteristic are described in **Table 2** under the theoretical framework (**Figure 1**). Data for the study is collected from two datasets: VHLSS 2018 and VHLSS 2020.

Table 2. Variables list and conventions.

Variables	Definition	Source
Dependent Variables		
income	Total income of respondent (mil. dong)	
hhinc	Total income of a household (mil. dong/household/month)	
Explanatory Variables		
HOUSEHOLD (HC)		
region	Area which they live (Urban = 1; Rural = 0)	(Luan and Bauer, 2016)
ethnic	Whether the respondent is Kinh (Yes = 1; No = 0)	
hysize	Number of household members (people)	
gender	Respondent gender (Male = 1; Female = 0)	
age	Respondent actual age (years)	
married	Get married (Yes = 1; No = 0)	
edu	Actual schooling years of householder (years)	
landpro	Get married (Yes = 1; No = 0)	
collateral	Household has collateral (Yes = 1; No = 0)	(Vu and Ho, 2021)
job	Occupation of respondent (The profession needs professional expertise = 1; Service industry group = 2; Technical occupation, labor = 3; Otherwise = 4)	
CREDIT (CC)		
CR	Access to credit (Yes = 1; No = 0)	
value	The value of loan (mil. dong)	(Vu and Ho, 2021)
paid	A loan origination fee (mil. dong)	(Vu and Ho, 2021)
interest	The interest rate charged to the borrower (%)	(Vu and Ho, 2021)
debt	Unpaid debt (mil. dong)	(Vu and Ho, 2021)
other	Household has other loans (Yes = 1; No = 0)	
HEALTH SHOCK		
CV	Household had/has infected with Covid (Yes = 1; No = 0)	

Source: Synthesis of the authors

3.3. Descriptive statistics

From the variables selected in **Table 2**, we conduct descriptive statistics from two data sets by two years, including min, max, mean, standard deviation, and standard error. **Table 3** shows the summary statistics of variables in this study.

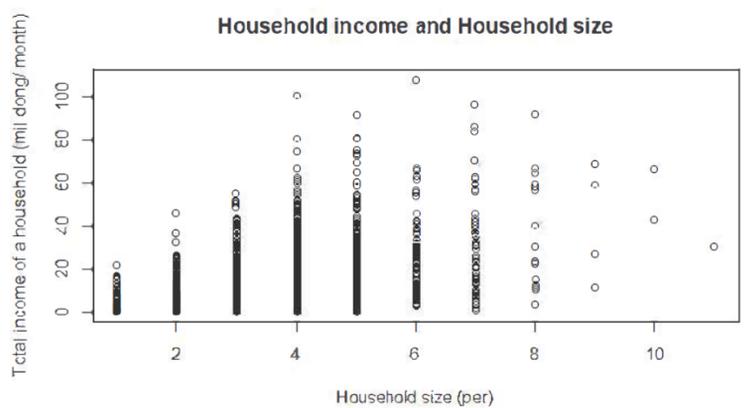

Table 3. Descriptive statistics.

Source: Authors' calculations

In terms of income, in 2018, the average income of respondents was approximately 3 million dong/month, while the maximum income reached 22 million dong, with a standard deviation of 2.69.

In 2020, the income range shifted slightly, with the average income recorded at 4.5 million dong, the maximum income at 135 million dong, and the standard deviation rising to 3.47. Moving on to the household income variable, we see a similar pattern. The mean household income was 13 million dong corresponding with the household members being 4 people. Follows **Figure 2** which describes the relationship between household income and members of the household:

**Figure 2. Household income and household size.**

Most respondents in both years identified as belonging to a particular region (20% in 2018 and 24% in 2020) and the same ethnic group (73%). The average household size remained consistent at around 3 to 4

members. The gender distribution also remained unchanged, with 75% of respondents identifying as male in both years. The average age decreased slightly from 49.24 in 2018 to 47.81 in 2020. Marital status slightly increased from 81% to 82% in both years, indicating a predominantly married population. Education levels exhibited similar patterns, with mean scores of 6.88 and 7.03 in 2018 and 2020, respectively.

Regarding land property, the mean value increased from 80.30 to 86.76, while collateral remained relatively stable at around 32% to 35%. Job types showed a slight variation, with different proportions across three categories (job = 1, job = 2, job = 3).

Households have shown an increasing inclination to participate in credit, with credit values rising from VND 71.6 million dong in 2018 to VND 102 million dong in 2020. Correspondingly, interest rates have also increased from 2.03% to 2.87% during the same period (**Table 3**). These trends suggest a growing demand for larger credit amounts. The proportion of respondents reporting other factors and the impact of COVID-19 in 2020 has also increased, highlighting changing circumstances and potential pandemic effects on the surveyed population.

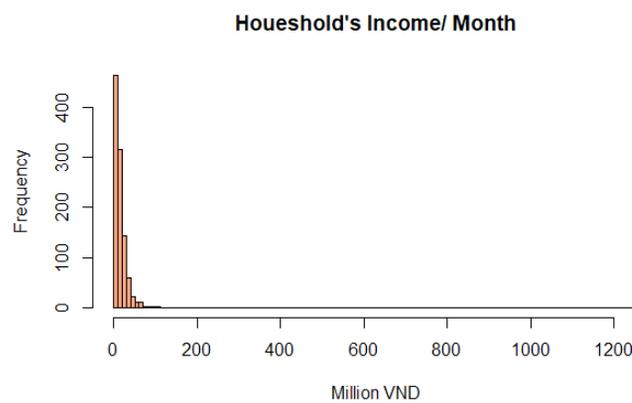

Figure 3. Distribution of household income in Vietnam.

Figure 3 shows that household incomes have a left-skewed distribution, so this study transforms the model into a log-lin model:

$$\ln(\text{hhinc})_{it} = \delta_0 + \delta_1 \text{CR} + \delta_2 \text{T} + \delta_3 (\text{CR} \times \text{T}) + \delta_4 \text{HC}_{it} + \delta_5 \text{CH}_{it} + \delta_6 \text{CV} + \gamma_{it}$$

Taking the logarithm of household income makes the model with the “hhinc” variable normally distributed in **Figure 4**.

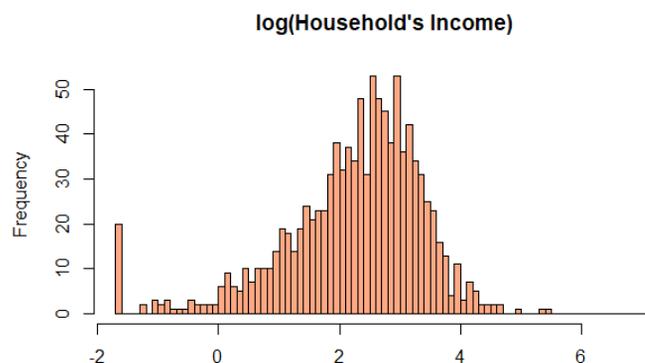

Figure 4. Distribution of the logarithm of household income.

4. RESULTS AND DISCUSSION

4.1. Estimated factors affecting access on credit

Table 4 shows logit regression results for credit access of Vietnamese people at two-time points: pre-COVID-19 and post-COVID-19. The results of this analysis are also consistent with (Vu and Ho, 2021).

Table 4. Factors affect access on credit.

Source: Authors' calculations

In 2018 and 2020, access to credit was dominated by the area in which the household head lived (results in **Table 4**, significance level of 5% in 2018 and 1% in 2020). In other words, the diverse living areas of households are influenced by factors like credit, smart technology, and modernization, which are prevalent in densely populated regions. The cultural characteristics of these regions strongly impact accessibility. This raises questions about Vietnamese people's aversion to credit risk and the quality of information provided by unsecured credit sources to household.

In 2020, the appearance of Covid reduced people's ability to participate in credit. Particularly, households who have been infected with Covid have a lower ability to access credit than households who have never been infected at this time about 11% at 5% significance level. The lack of statistical significance among variables, such as household and credit characteristics, underscores the profound impact of Covid on credit access. The pandemic not only affects health and mental well-being, but also restricts access external information and human interaction.

4.2. The impact of credit policy on improving Vietnamese household income

After analyzing the factors affecting the credit access of Vietnamese households using the results in **Table 4**, we carry out a regression of the total average income of households with the proposed variables according to the previous explanation.

The regression model results without explanatory variables show that the effect of credit policy raising session model results without explanatory variables show that credit policy raises household income to 56%. From **Table 5**, DiD approach shows that distinctive from two groups is 15%. Nevertheless, R^2 and Adjusted R^2 only reach 0.23 and 0.25, respectively, so we carry out the regression within explanatory variables (**Table 5**).

Source: Authors' calculations

At a 95% confidence interval, credit improves household income by 34%, with participating households experiencing even greater increases. This highlights the timely support credit provides to households during peak periods in Vietnam.

Furthermore, urban households have a 25% higher income compared to rural households, indicating the influence of higher-paying urban occupations and cultural factors. Household size also plays a significant role, with each additional member leading to a 30% increase in income. However, the health shock of COVID-19 has had a negative impact, with infected households experiencing a 25% income decrease.

This study primarily focuses on assessing the impact of credit policy at the average income level. To underscore the impact of the policy, we conducted a similar regression but divided it into urban and rural areas.

Table 6. Results of regression with dividing into two areas.

Source: Authors' calculations

Firstly, in rural areas, credit has no effect on improving household income. In contrast, in urban areas, households improved by 13% and differed from non-participating households by 25% (Table 6). This finding raises a big question about why rural credit is inefficient. Limited knowledge and usage of credit in rural areas contribute to income inequality, particularly among poorer households, risking further impoverishment. This loophole must be addressed further.

The next difference between urban and rural areas is the effect of COVID-19 on income. Compared with rural areas, urban areas have to suffer a decrease of about 32% in household income when someone is infected, and the difference between the two regions can be explained in many ways, such as: regional culture, occupation characteristics, size of the area.

Including other explanatory variables such as age, household size, and occupation into the model reinforces the cultural factor that directly affects the characteristics of households in different regions and the income of households in the high and low groups.

4.3. Evaluating the impact of credit policy by using PSM-DiD

Following the suggested steps for the PSM method, the study provides Table 7 of the matching results based on the “nearest” method.

Table 7. Statistical result of PSM with “nearest” method.

Variables	In common support zone	Out common support zone
region	0.46	0.46
ethnic	0.81	0.84

After performing the pairing, we calculate the Average Treatment effects on the Treated (ATT) index to estimate the total income for the treatment group with a common support zone.

Table 8 provides the results from the two methods’ estimated coefficients. All believe credit has a positive effect (99% and 95% confidence levels).

Table 8. Summary of two methods.

Variables	ATT (2020)		DiD Estimation	
	Coeff.	t-test	Coeff.	t-test
CR	0.11***	1.62	0.34**	2.78
Obs.	37		521	

Note: *, **, *** indicate the significant at level 10%, 5% and 1%

Source: Authors’ calculations

The study uses ATT to diagnose the expected value that a household receives when participating in credit in the context of the COVID-19 epidemic by kernel pairing. **Table 8** shows that credit always has a positive effect on income growth. On average, household income only rise by 11% expected in the epidemic context. However, in the DiD method, households participating in credit will increase their income by 34%. In conclusion, the PSM-DiD method comprehensively estimates people’s income during the Covid period.

4.4. Specification tests

After utilizing the methods to estimate the model, the team continues to execute tests to check the model’s often encountered faults. First, to check whether the model has multicollinearity, we use the Variance Inflation Factor (VIF) system.

The VIF value of two independent variables (debt and value) is more than 10 (21.83 and 20.74, respectively), so these variables have multicollinearity. To solve this problem, this study decides to drop two variables out of the model.

Then, we also check heteroskedasticity by using a graph of variance prediction (**Figure 5**).

Using graph residuals against the predicted variable, **Figure 5** shows intermittent and low distribution, which indicates the model has heteroskedasticity. To remove this, we use Robust Standard Error (RSE).

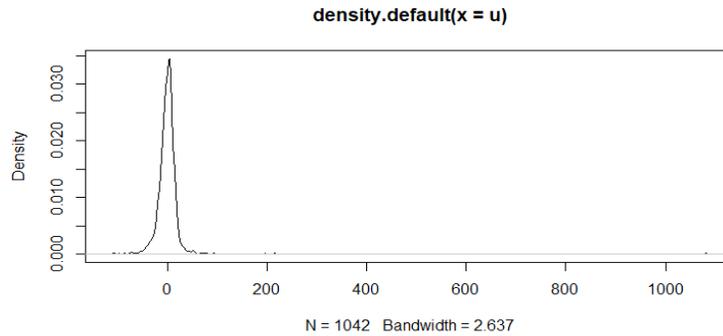

Figure 5. Graph residuals against predicted dependent variable.

Next, we use F-Test with estimated model in Vietnam with hypothesis:

H0: $\delta_1 = \delta_2 = \delta_3 = \delta_4 = \delta_5 = \delta_6 = 0$

H1: At least one δ different from 0

Table 9. F-Test.

Estimated model in Vietnam	R ²	Adj R ²	F-Test
	0.44	0.39	(0.000) < 1%

Source: Authors' calculations

Table 9 shows p-value < 1%, so we reject H0. The hypothesis that all coefficients are equal to zero simultaneously is rejected at 1%.

As noted in **Table 9**, Adjusted R Squared reaches 39%, which indicates that the four independent variables have been able to explain (39%) the changes occurring in the dependent variable.

4.5. Discussion

The results indicate that area of residence is the dominant determinant of household credit access in both pre-pandemic periods and during the pandemic. This credit access increases Vietnamese household income significantly while it is expected to reduce income. Despite increasing income, household’s credit participation is still very limited when only 3.24% of households participate in credit.

Finally, after using regression analysis, two of the three hypotheses (H2 and H3) are accepted and the first hypothesis is rejected (H1) by the regression results.

Regarding Hypothesis 1, the results indicate that only “region” has significance, however, it cannot comprehensively describe the differences of households. Household characteristics include household size, and information about householders. Thus, we must reject H1 because of being not similar to Woo (2019).

Regarding Hypothesis 2, Covid affects Vietnam and the world in many aspects, such as social communication, movement restrictions, service trade, etc. This shows that Covid is a big obstruction for humans. The hypothesis mentioned in the study that Covid is an impediment to access to credit, this is accepted with a confidence interval is 95% ($\alpha = -0.11$).

Hypothesis 3 indicates that access to credit has a positive impact on the total income of a household. The significance level is 5%, hence, we accept H3. This result is similar to the studies of Trumbull (2008)

in France and the USA, and Bocher et al. (2017). The treatment group has a higher improving income than the control group in 2020, the $\delta\delta$ estimated is 0.34.

Table 10. Summary of the hypothesis.

Hypothesis	Conclusion
H1: The differences of household characteristics impact on credit access.	Sig. = 0.00 < 1% and $\alpha = 0.71$ Rejected
H2: COVID-19 is an obstruction of accessing on credit.	Sig. = 0.034 < 5% and $\alpha = -0.11$ Supported
H3: Credit has a positive impact on the total income of households in calamity.	Sig. = 0.027 < 5% and $\delta = 0.34$ Supported

Source: Synthesis of the authors

In addition to approaching the research objectives through the hypotheses summarized in **Table 10**, this study pays special attention to the two goals of the Sustainable Development Goals (SDGs): “No Poverty” and “Reduce Inequalities”. These goals focus on reducing income inequality and ensuring equitable access to credit. The impact of the pandemic resulted in significant financial pressure not only for impoverished households but also for well-to-do households. Research findings indicate that households experienced a 25% income reduction due to COVID-19. Notably, the epidemic had a more pronounced effect on urban households (**Table 11**) when considering the regional aspect.

Table 11. The difference effects of COVID-19 between rural and urban.

	Variables	Conclusion	Confidence Interval
Rural	CV → ln(hhinc)	No Impact	< 90%
	CV → CR	No Impact	< 90%
Urban	CV → ln(hhinc)	Impact	95%
	CV → CR	Impact	95%

Research indicates that COVID-19 has a disproportionately negative impact on urban households compared to rural areas, particularly in terms of household income and credit access (95% confidence interval). Urban areas, characterized by thriving industries, banking systems, and financial facilities, exhibit greater economic development than rural areas. This economic disparity not only exacerbates income inequalities but also affects other aspects of life. Additionally, urban areas face challenges in enforcing social distancing measures, resulting in strict government regulations. As a result, these places experience more pronounced economic repercussions, making it challenging for individuals to manage expenses such as rent. This represents a major crisis and aligns with the “No Poverty” goal of the SDGs. Moreover, the limited access to credit in urban and rural areas underscores the presence of inequality.

Table 12. Accessing on credit in 2018 and 2020.

	Variables	Conclusion	Confidence Interval
Before calamity	CR ← region	Impact	95%
In calamity	CR ← region	Impact	99%

Source: Synthesis of the authors

Access to credit is more readily available in urban areas due to the presence of diverse credit support and extensive banking systems. This means that impoverished households in urban areas have greater access to credit compared to their rural counterparts. The disparity in credit access between urban and rural areas is a concerning

issue for credit policy makers, particularly as rural households face significant disadvantages. The SDGs goal of “Reduce Inequalities” should serve as a guiding principle for the government to address this regional gap.

5. CONCLUSION

This study contributes to both methodology and policy.

From a methodology perspective, our analysis reveals a significant relationship between credit access and household income, particularly for the region variable. Urban residents have significantly higher credit accessibility than their rural counterparts (approximately 71%). Credit positively impacts urban income, with a notable 13% growth. However, its effect on rural income is limited. Unequal credit distribution in rural areas hampers substantial income growth. Failure to distribute credit market benefits fairly among different population groups may lead to inequality and social instability.

From a policy perspective, this study sheds light on the factors contributing to increased access to credit among Vietnamese individuals, emphasizing the transformative role of credit in empowering households and fostering economic growth. By facilitating opportunities and driving entrepreneurship, credit plays a pivotal role in poverty reduction, income enhancement, and efficient resource allocation. However, realizing substantial household income and living standards improvements necessitates strategically focusing on effective and profitable business investments.

This study provides an understanding for further research, despite acknowledging certain limitations. It should be noted that the data set used in this study only covers the year 2020, which may not fully capture the evolving impact of the epidemic during its peak period in 2021. The available data lack information on financial resources, capital constraints, and specific credit needs, which could provide a more comprehensive understanding of credit access. While the study primarily focuses on observable factors, it is important to recognize the limited emphasis on unobservable factors, such as social networks and social capital.

For future research, we recommend comparing the effects of credit and credit support policies in the pre-and post-COVID-19 pandemic periods. To ensure accurate impact estimation, it is crucial to account for and measure such differences in the data. Moreover, it is worth noting that only a subset of variables demonstrates statistical significance, suggesting a lack of credit knowledge and concerns about credit risks among many households in Vietnam. Therefore, providing more information on poverty alleviation conditions and streamlining procedures is crucial for formulating effective policies. Inefficient credit utilization could lead to over-indebtedness or default among households, imposing significant stress and jeopardizing their well-being (Seng, 2018; Tsai et al., 2016).

TECHNOLOGY - ORGANIZATION - ENVIRONMENT (TOE) FRAMEWORK: PROPOSED FOR VIETNAMESE BUSINESS IN THE DIGITAL AGE BASED ON SDGS

Author: Le Hong Diem¹, Luu Tuan Khang¹, Ngo Trieu Chau¹, Nguyen Thuy Linh¹, Huynh Le Thuy Van¹

ABSTRACT: The article discusses the impact of e-commerce on organizational performance and the evaluation of Sustainable Development Goals (SDGs) in the online retailing world. The study focuses on Vietnamese companies in the early stages of digital transformation and uses an extended Technology-Organization-Environment (TOE) framework aligned with SDGs to identify motivations and factors influencing business performance. The research employs a deductive approach and quantitative methods, collecting data through a questionnaire from a sample size of 300. The collected data undergoes testing, reliability assessment, exploratory factor analysis, and multivariate regression analysis to measure the impact of variables in the research model. The results indicate that factors related to technological context, organizational context, and environmental context significantly contribute to digital adoption among Vietnamese businesses. Surprisingly, firm size, same-industry competition, and control variables such as the number of employees do not have a significant effect. The article discusses theoretical and practical implications, highlighting the potential of the TOE framework based on SDGs and providing recommendations for businesses.

Keywords: TOE framework, sustainable development goal, Vietnamese business

1. INTRODUCTION

Organizations are undergoing a significant shift toward digital transformation to ensure long-term viability in a highly competitive global landscape. Managers are recognizing the importance of incorporating innovative technologies into their growth strategies. The COVID-19 pandemic has been a catalyst for businesses to embrace digital transformation and adapt to new market conditions. Integrating technologies into business operations has emerged as a promising approach, allowing firms to expand their customer base, improve operational efficiency, and achieve sustainable growth. Additionally, the United Nations' Sustainable Development Goals (SDGs) have become a prominent agenda for organizations seeking to align their operations with global sustainability objectives.

Current literature focuses on technological, organizational, and environmental contexts, utilizing various models such as the Technology Acceptance Model (TAM), Diffusion of Innovation (DOI), and the Unified Theory of Acceptance and Use of Technology (UTAUT). The TOE framework, recommended by Tornatzky, is widely used to understand the adoption of various innovations at the firm level, emphasizing a holistic mechanism that flexibly incorporates influential technological, organizational, and environmental contexts. Therefore, according to several studies, there are significant drawbacks in developing digital implementation among Vietnamese firms concerning infrastructure, management, and internal and external facilitators.

The Covid-19 period has induced companies to the importance of technology in expanding business models and gaining sustainable development (Fonseka, 2022). The digital economy and sustainable consumption are interconnected aspects that are increasingly intertwined. With the projected growth of internet users to 76 million by 2023, firms are driven to pursue technological innovations aligned with the SDGs. Nonetheless, SDGs require thorough study to determine which business practices align with sustainable development approaches (Haffar & Searcy, 2018). In this context, the authors consider TOE Framework and SDGs as the main foundations to research proposed for Vietnamese businesses in the digital

1 University of Economics Ho Chi Minh City.

age. It can broadly apply as TOE Framework is non-restricted by industry and business size (Tornatzky & Fleischer, 1990). Besides, TOE Framework by Tornatzky et al. (1990) is strongly advocated by diversified studies toward a wide range of innovations at the firm level (Chatterjee et al., 2020; Abed, 2020; Abbasi et al., 2022; Maroufkhani et al., 2022).

The research aims to deeply study the factors that affect Business Performance through 16 hypotheses. The study considers the supposed model with three main aspects, including Technology, Organization, and Environment directly affect to Adoption Intention and thereby impact Business Performance. At the same time, some crucial variables such as Business Age, Number Of Employees, Type Of Business, and Field Of Business are added to expand the model and enrich the analysis of Business Performance. Consequently, the study can draw objective judgments through profound insights to make practical recommendations for increasing business performance in Vietnam following SDGs goals.

2. THEORETICAL BASIS

2.1. Study Overview

The Technology-Organization-Environment (TOE) framework, introduced by Tornatzky and Fleischer, delves into the innovation development process and its implementation within enterprises. TOE is an organization-level theory that considers three key factors: technology, organization, and environment, which influence adoption decisions. Unlike other models, TOE comprehensively captures internal and external impacts. It covers technological landscapes, environmental contexts, and organizational characteristics. The 2030 Agenda for Sustainable Development outlines the 17 Sustainable Development Goals (SDGs), aiming to promote peace, prosperity, and environmental sustainability. The UN Department of Economic and Social Affairs Division for SDG supports the implementation and adoption of the SDGs. It plays a vital role in monitoring progress and advocating for the goals across the UN system. By embracing the SDGs, the 2030 Agenda can be translated into tangible outcomes, and the DSDG is committed to facilitating this process.

2.2. Relationship between TOE framework and business in digital context

Several studies have demonstrated the influence of technology, organization, and environment on a company's identification, search, and adoption of new technology. Chatzoglou and Chatzoudes (2016) outlined the key premises of the TOE framework in fostering e-business adoption. The TOE Framework and sustainable development have been studied in relation to various applications. El-Haddadeh et al. (2021) proposed TOE-based tuning as a new explanatory model for large data analytics. TOE is often combined with other models to examine innovation adoption. Chatterjee et al. (2020) developed a hybrid TOE-TAM (Technology Acceptance Model) to clarify Industry 4.0's relevance and driving forces for digital manufacturing. Khan et al. (2021) proposed a mobile payment system based on the expanded TOE framework, identifying key drivers for behavioral intention and actual use in enterprise systems. Hiran and Henten (2020) established a link between TOE and DOI in the context of cloud computing use in educational organizations. Various studies highlight TOE's application in different areas such as AI, e-commerce, big data, and social media marketing.

In recent research, the application of the TOE framework has been explored in various fields and industries. Lin (2023) suggests using TOE in the maritime industry by applying to blockchain technology. Abdullah et al. (2023) focus on developing communication within businesses under the Zakat organization using the TOE framework. Rawashdeh & Rawashdeh (2023) examine the effects of TOE on small and medium-sized enterprises when implementing cloud accounting. Additionally, Rawashdeh and colleagues (2023) investigate the use of AI in automated accounting and its application in human resource management.

Bratec et al. (2023) study the impact of TOE-based incentives on hotels in Slovenia, while Nikopoulou et al. (2023) analyze factors influencing digital transformation in the hospitality industry. Sulaiman et al. (2023) propose the integration of TOE with TAM for a learning management system among university lecturers. Awaluddin et al. (2023) emphasize the significant effect of TOE on the food and beverage sector, stressing the importance of technology awareness and e-commerce skills. Finally, Medennikov (2023) presents a sustainable development model for agricultural organizations, incorporating strategic management and a digital platform.

The research recommends sustainable development strategies for businesses based on the UN's Sustainable Development Goals (SDGs). Previous studies have utilized the TOE framework to guide small and medium-sized enterprises (SMEs) in their sustainability efforts. In Taiwan, a study explored the application of Technology 4.0 to assist enterprises in achieving the SDGs. Digital transformation, as discussed by Popescu & González, has the potential to impact organizational culture and employee motivation. Integrating industry 4.0 and SDGs can enhance enterprise efficiency and contribute to sustainable development, as highlighted by Karamustafa & Arsan. Zhong et al. (2023) demonstrated the impact of digital transformation on an enterprise's environmental, social, and governance (ESG) performance, emphasizing its significance for sustainable development.

2.3. Theoretical Framework

The TOE framework was established by Tornatzky et al. (1990) to thoroughly explicate behavioral intentions, adoption and implement business intelligence at a business level. Besides, the framework looks more into the whole organization (Ashraf et al., 2022) and is not limited to specific industry and business size (Tornatzky and Fleischer, 1990), thus, it is broadly applied from in technology adoption and risk management (Dewi et al., 2018), integrated platforms (Anindra et al., 2018), data-driven and innovative solutions for sustainability (Bibri and Krogstie, 2020), digital nations development (Kar et al., 2019), etc. In comparison with most other frameworks, TOE's profound examination of both human and nonhuman actors are assessed as a significant strength in measuring technology adoption and scalability towards SDGs (Ashraf et al., 2022). Several studies have added different variables to modify their models. Thus, the study constructs the combination of TOE-TAM and also adds variables to suggest an extended model. Consequently, the TOE framework induces businesses to achieve a more complete understanding of business performance in the Vietnam digital age.

Besides, TAM is useful in examining business performance influenced by factors from technology and adoption intention (Tran et al., 2022). In the study context, TAM antecedents are combined with the TOE framework to figure out the crucial influencers of adoption (Chatterjee et al., 2020) and performance. TAM was developed by Davis in 1989 and evolved from the theory of reasoned action (TRA). In the TAM, perceived ease of use and perceived usefulness are two main elements. Perceived ease of use is the degree to which an individual believes that using a particular information technology saves effort. Based on perceived ease of use and perceived usefulness, the research examined its similarities with Relative Advantage and Observability to measure the positive effect of adoption intentions under technology innovations. Despite TRA and the Theory of Planned Behavior can apply by incorporating subjective norms and perceived behavioral controls with attitudes toward using technology, TAM is more appropriate. TAM is quite similar to TOE in that it is not restricted to specific industries or businesses. Thus, it can be expanded and has applicable features for business in Vietnam which are relevant to the direction of the article. Consequently, TAM is selected as the foundation theory to conduct research and proposals for businesses in the digital transformation period in Vietnam.

The factors belonging to firm characteristics including Business Age, Number Of Employees, Type of Business and Field Of Business were formed on the basis of previous studies, specifically the study of Tran et al., (2022) on online retailing, Fahim et al., (2021) on sustainable smart cities governance which impact on Business Performance based on from TOE Framework. Hence, the conceptual framework of the study as described served as the foundation for the specific hypotheses and revealed correlations between the variables accepted.

3. RESEARCH HYPOTHESIS

3.1. Relative Advantage

The phrase “*relative advantage*” describes how much a certain product looks to be superior to another existing product. Businesses can use this concept to gauge customer preference for their product compared to competitors. The more advantageous the product, the higher the likelihood of consumer acceptance, and vice versa. Decisions to implement innovation policies are influenced by the perceived relative advantage (Abbasi et al., 2022).

Hypothesis 1: Relative advantage has a positive effect on the TOE framework adoption intention of the business.

3.2. Compatibility

Compatibility refers to the interoperability of different products, including hardware, software, and goods of various versions, without causing disruptions (Géczy et al., 2012). It is crucial for businesses as it determines how well an innovation aligns with their existing practices, values, and requirements. Tajudeen et al. (2018) also highlight the significance of compatibility in social media marketing interactions. Furthermore, Maroufkhani et al. (2022) conducted a study on big data analytics usage and its quantitative relationship with compatibility.

Hypothesis 2: Compatibility has a positive effect on the TOE framework adoption intention of the business.

3.3. Observability

According to Roger (2003), observability can be understood as the ability to display the expected outcomes of an innovation. Gartner Research defines observability as “*the evolution of monitoring into a process that offers insight into digital business applications, speeds innovation and enhances customer experience.*” Previous studies have highlighted that businesses are more likely to adopt innovations when they are easily observable (Jilani et al., 2022). AlBar and Hoque (2019) emphasize that observability plays a crucial role in predicting the adoption of cloud enterprise resource planning (ERP) by businesses. Similarly, Khan et al. (2021) explored the significance of observability in promoting the adoption of mobile payment systems. Jilani et al. (2022) found that increasing the visibility of the mHealth app to potential users results in higher user interactions. In essence, making innovations more visible facilitates their rapid adoption.

Hypothesis 3: Observability has a positive effect on the TOE framework adoption intention of the business.

3.4. Managerial Support

The topic of research on the linkages and mutual support among managers, leaders and employees has recently attracted a lot of research participation (Kurtessis et al., 2017; Van Buren et al., 2011). Perceived organizational support acknowledges interdependence and mutual aid (POS). High managerial support is determined by managers’ comprehension and appreciation of technological innovations’ potential (Maroufkhani et al., 2022). This component contributes to creating a conducive environment, optimizing resource utilization, and promoting innovation process growth (Abbasi et al., 2022).

Hypothesis 4: Managerial support has a positive effect on the TOE framework adoption intention of the business.

3.5. Business Size

Previous research has debated the significance of organizational factors, specifically business size. Some studies indicate that business size acts as a moderating factor influencing decision-making (Zona et al., 2013). Larger businesses tend to find it easier to secure investment cash, which is attributed to their perceived better management skills compared to smaller competitors (Santoso & Junaeni, 2022; Ludianingsih et al., 2022). Moreover, larger businesses are considered more efficient and financially stable, enhancing their overall value (Murti & Purwaningsih, 2022). The adoption of the TOE framework is influenced by business size even if it entails time-consuming and expensive processes (Cho et al., 2022).

Hypothesis 5: Business size has a positive effect on the TOE framework adoption intention of the business.

3.6. Business Orientation

Business orientation refers to an organization's capacity to identify and capitalize on opportunities in new markets through creative decision-making, risk-taking, and innovation (Lumpkin & Dess, 1996; Wiklund & Shepherd, 2003). It is characterized by proactive assessment and utilization of emerging business opportunities (Rubin & Callaghan, 2019). Research suggests that businesses aiming to compete in the digital landscape require a strong business focus (Tajudeen et al., 2018). High business orientation organizations exhibit a willingness to experiment, champion novel concepts, and deviate from established norms. They must also anticipate both positive and negative consumer reactions (Susanto et al., 2020). Specifically, during the pandemic, social media usage and company success are closely associated with business orientation (Susanto et al., 2020).

Hypothesis 6: Business orientation has a positive effect on the TOE framework adoption intention of the business.

3.7. Technology Orientation

An organization's technology orientation reveals its capacity to spot and adopt innovations. Businesses enhance knowledge of how digital technology breakthroughs are influencing company services in the context of the present digital transformation scenario (Rupeika-Apoga et al., 2022). Upadhyay et al. (2023) showed that a family firm's technological orientation toward AI in digital entrepreneurship leads to the adoption of AI because it raises the business's strategic and operational business value. Additionally, technology orientation is crucial for creating novel concepts and improving existing systems and processes.

Hypothesis 7: Technology orientation has a positive effect on the TOE framework adoption intention of the business.

3.8. Same-Industry Competition

Rivalry among businesses in the same sector is linked to competition in that industry (Oliveira et al., 2014). As market competition intensifies, businesses are compelled to develop new approaches, solutions, and resources and seek innovative methods to gain a competitive advantage. The TOE framework can facilitate the creation of a successful business model, enhance operational efficiency, reduce expenses, improve communication, and facilitate information access. To keep pace with competitors who have already implemented TOE-based operations, businesses must embrace the same transformation and strive for improved performance (Abbasi et al., 2022). Embracing innovation can help businesses enhance their competitive position amid changing industry structures (Hiran and Henten, 2020).

Hypothesis 8: Same-industry competition has a positive effect on the TOE framework adoption intention of the business.

3.9. Business Trend Awareness

The ability to step back from everyday business concerns in order to grasp the wider picture is what is essentially meant by the term “*business awareness*” (Jorge, 2019). Similarly, it positively affects attitudes and behavioral intentions towards blockchain based on its technical advantages and merits from a corporate perspective (Li, 2020).

Hypothesis 9: Business trend awareness has a positive effect on the TOE framework adoption intention of the business.

3.10. Governmental Support

Governmental support is the term for the function that the government plays in fostering and encouraging the adoption and utilization of technology (Tornatzky & Fleischer, 1990). The government is a significant external force that has the power to provide favorable conditions and offer incentives for the adoption of technology. As a result, when implementing the TOE framework, customers anticipate government assistance in the form of regulations, rewards, and financial aid. Therefore, governmental assistance can be operationalized as the function of government-related policies that encompass a new set of guidelines and adoption incentives for the TOE framework.

Hypothesis 10: Governmental support has a positive effect on the TOE framework adoption intention of the business.

3.11. Legal Framework

Compliance with legal requirements is crucial for businesses to participate in a nation’s economy. The legal system consists of essential documents like constitutions, laws, rules, and contracts. A company’s adherence to these rules is reflected in the regulatory framework (Hiran and Henten, 2020). Understanding industry-specific regulations in the Internet environment is vital. Some laws may require businesses to adopt the TOE framework for research purposes (Hiran and Henten, 2020). Research by Maroufkhani et al. (2022) revealed that heavy regulation and government pressure prompt businesses to use big data. The regulatory environment also influences the widespread use of big data (Park and Kim, 2021).

Hypothesis 11: Governmental support has a positive effect on the TOE framework adoption intention of the business.

3.12. TOE Framework Adoption Intention and Business Performance

Businesses’ perceptions of their intentions to employ an invention are described by the term “*adoption intention*”. It is recognized as a crucial motivator for creative use (Venkatesh et al., 2012). Adoption intentions significantly influence the implementation of technologies in organizations. In the case of mobile payments in China and Pakistan, Khan et al. (2021) found a strong link between behavioral intention and actual use among SMEs. However, Hashimy et al. (2022) discovered a weak and insignificant correlation between the intention to adopt blockchain technology and its actual use among Spanish enterprises. This study uses business performance as an indicator of actual technology usage, considering its impact on profitability, survival rates, and future expansion.

Hypothesis 12: TOE framework adoption intention of the business has a positive effect on the business performance.

3.13. Control Variables and Business Performance

Consideration of various factors such as business age, number of employees, business type, and industry is crucial when assessing their impact on business performance. Previous studies have explored how these factors influence a business’s behavioral intention. For instance, Cruz-Jesus et al. (2019) found that business age and industry significantly influence CRM adoption. Furthermore, this study introduces the variable of company type, expanding on Nguyen et al.’s (2022) research model. Since the type of business is diverse and holds significant importance in decision-making for innovation, this aspect deserves attention in both the context of Vietnam and the global economy.

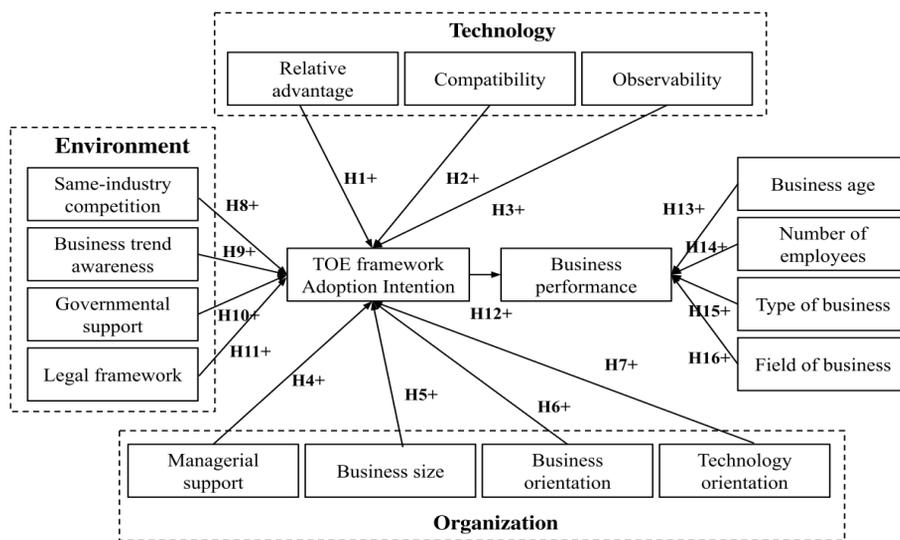

Hypothesis 13: Business age has a positive effect on the business performance.

Hypothesis 14: Number of employees has a positive effect on the business performance.

Hypothesis 15: Type of business has a positive effect on the business performance.

Hypothesis 16: Field of business has a positive effect on the business performance.

Figure 1: Research Model

Source: Synthesized research team

4. RESEARCH METHOD

4.1. Sample

A cross-sectional study was conducted in Vietnam, involving 300 participants of varying ages, from high school students to postgraduates. Data was collected through a self-administered survey created using Google Forms. Permission to participate was obtained after explaining the research goals to managers, directors, and officers. Subsequently, 300 valid responses were retained for data analysis, collected since May 2022.

4.2. Instrument Development

This study utilized a questionnaire-based survey, divided into three sections, to gather data. The first section provided research context and objectives, the second described respondents’ demographic characteristics, and the third contained measurement items for the constructs. Experts’ advice was sought to ensure questionnaire relevance, and a 5-point Likert scale was used (ranging from “1” for “*extremely disagree*” to “5” for “*extremely agree*”)

Various multi-variable scales were adapted from previous literature to measure latent variables in the study. For the technological context, scales from Grandon and Pearson, Al-Qirim, and Kendall et al. were utilized. Organizational context scales incorporated top management support, firm size, entrepreneurial orientation, and technological orientation from multiple sources. The environmental context was assessed

through scales for competitive pressure, perceived trend, government support, and legal framework. Additionally, adoption intention and business performance were adapted from specific authors' works.

For EFA exploratory factor analysis, a recommended minimum of 5 valid data samples per observed variable and a total sample size of at least 100 were followed, as indicated by Hair et al. (1998). The minimum sample size for regression analysis was calculated using the formula $n \geq 50 + 8 * (\text{number of independent variables})$ as suggested by Tabachnick and Fidell (1996). For a model with 13 independent variables, the calculated minimum sample size would be 154.

5. RESULTS AND DISCUSSION

5.1. Respondents' Demographic Characteristics

The survey collected demographic information from respondents, with 76% falling within the 18 to 50 age range. In terms of education, 25% had graduate degrees, 27.3% had postgraduate degrees, and 47.7% had high school qualifications or undergraduate degrees. In regards to salary, 73.3% earned less than 50 million VND, while 26.7% earned above that level. In terms of professional experience, 20.3% had 3 to less than 5 years, 28% had 5 to 10 years, 25.7% had less than 3 years, and 26% had over 10 years of experience. Respondents mainly came from small and medium firms (50.3%) with 10 to 300 employees, followed by very small firms (26%) with less than 10 employees, and large firms (23.7%) with over 300 employees. The study also gathered data on business types, with joint stock companies, one-member limited liability companies, and partnerships being popular. In terms of fields, the service sector accounted for 14.0% of respondents, while the manufacturing sector comprised 16.0%.

5.2. Evaluating Scales of Concepts (Reliability Test with Cronbach Alpha, Validity Test with EFA)

5.2.1. Reliability Test with Cronbach Alpha

The reliability of the scales used in the study was assessed using Cronbach's Alpha coefficient, with all scales demonstrating satisfactory levels of internal consistency. The Relative Advantage scale had a Cronbach's Alpha of 0.703, the Compatibility scale had a Cronbach's Alpha of 0.699, the Observability scale had a Cronbach's Alpha of 0.703, the Top Management Support scale had a Cronbach's Alpha of 0.746, the Business Size scale had a Cronbach's Alpha of 0.786, the Business Orientation scale had a Cronbach's Alpha of 0.753, the Technological Orientation scale had a Cronbach's Alpha of 0.743, the Same-industry Competition scale had a Cronbach's Alpha of 0.706, the Business Trend Awareness scale had a Cronbach's Alpha of 0.714, the Governmental Support scale had a Cronbach's Alpha of 0.763, the Legal Framework scale had a Cronbach's Alpha of 0.658, the Adoption Intention scale had a Cronbach's Alpha of 0.612, and the Business Performance scale had a Cronbach's Alpha of 0.683. Additionally, all observed variables within each scale demonstrated correlations higher than 0.3, further confirming the satisfactory nature of the scales.

5.2.2. Validity Test with EFA Exploratory Factor Analysis

a) Evaluations criteria

With the objective to avoid the occurrence of multicollinearity when applying the TOE model, the study conducted to add variables into groups according to the TOE framework as following table:

Table 5.1: Adjusted sign

Adjusted sign	Sign	Mean
TE1	RA	Relative advantage
TE2	CP	Compatibility
TE3	OS	Observability

b) EFA analysis result

The method of extracting Principal components along with Varimax rotation used to conduct EFA exploratory factor analysis. The EFA factor analysis extracted 4 factors from 14 observed variables, explaining 67.124% of the data variation. The total variance extracted meets the condition of being greater than 50%, indicating that the EFA model is suitable.

Table 5.2: Rotated Component Matrix

Rotated Component Matrix ^a				
EV1	0.982			
EV3	0.969			
EV2	0.905			
EV4	0.884			
AI2		0.717		
AI1		0.694		
AI3		0.622		
OR4			0.766	
OR3			0.759	
OR2			0.610

TE2				0.759
TE1				0.697
TE3				0.560

Source: Authors' research results

From the analysis results table of the Rotated Component Matrix, the factor loading coefficients of the observed variables are all > 0.5 and 4 factors are generated. Thus, exploratory factor analysis EFA for independent variables was performed four times, 14 observed variables converged and differentiated into 4 factors.

5.3. Testing of Research Hypotheses (Testing by Correlation and Multiple Regression)

The significance level (Sig.) of ≤ 0.05 indicates a significant correlation. A positive correlation coefficient close to 1 indicates a strong positive relationship, while a negative coefficient close to -1 indicates a strong negative relationship. A coefficient close to 0 suggests a weak correlation or no linear/nonlinear relationship. The dependent variable Adoption Intention (AI) is correlated with the independent variables (TE, OG, EV), as indicated by their Sig. values of 0.000 (< 0.05). The Pearson correlation values for these factors are similar, and none of them show a strong correlation. Additionally, some independent variables show correlations with each other, indicating potential multicollinearity that requires further analysis.

5.4. Regression Analysis

5.4.1. Evaluating the Fitness of the Regression Model – Correlation Test

The R - squared coefficient is 0.228 and the corrected squared coefficient is 0.220. From here, we can see 3 independent variables including Technology (TE), Organization (OG) and Environment (EV) are

included in the model that explains 22.0% of the impact of Adoption Intention. The Sig. value. = 0.000b < 0.05, thus, the proposed linear regression model is suitable for the collected data.

5.4.2. Regression Coefficient Test – Multicollinearity

Research results state the complete regression equation as follows:

$$\mathbf{AI = 0.024 + 0.370TE + 0.434OG + 0.134EV}$$

The research team chooses the 5% test level, from which we have the Sig condition. < 0.05. Thereby, the variables that are correlated with the dependent variable include Technology (0.000), Organization (0.000) and Environment (0.006). In other words, variables: Technology, Organization and Environment have an impact on the dependent variable Adoption intention (AI).

Next, the Unstandardized Coefficients B data showed that most of the independent variables have positive regression coefficients, specifically these are Technology (B = 0.370), Organization (B = 0.434) and Environment (B = 0.134). Thus, the above independent variables all have a positive effect on the dependent variable Adoption intention.

The larger the absolute value of Standardized Coefficients β , the larger the independent variable has a stronger effect on the dependent variable. From the table, the normalized regression coefficient of the variable Organization is the largest (0.270), followed by Technology (0.228) and finally Environment (0.103). Therefore, the variable Organization has the strongest impact on the dependent variable Adoption intention and the variable Environment has the weakest.

Next, the group conducts the multicollinearity test. The table shows that the VIF of all the independent variables is less than 2, so the variables have a close relationship with each other and there is no multicollinearity phenomenon.

5.5. Testing by Correlation and Multiple Regression between Toe-Framework Adoption Intention and Business Performance

5.5.1. Pearson Correlation Coefficient Analysis

The topic has Pearson correlation coefficient analysis to examine the linear relationship between Adoption Intention variable and Business Performance variable. There is a correlation between “*Business Performance*” (BP) and “*Adoption Attention*” (AI). However, the AI variable (Sig of AI) is 0.000 and has a correlation with BP because it is smaller than 0.05. The factor has Pearson correlation values approximately the same and both of the two factors have strongly correlated.

5.5.2. The Influence of Examined Factors On Adoption Intention And Business Performance

The R - squared coefficient is 0.564 and the Adjusted R-squared coefficient is 0.562. From here, we can see an independent variable AI (Adoption Intention) value is included in the model that explains 56.2% of the Business Performance. The Sig value. = 0.000b < 0.05, thus the proposed linear regression model is suitable for the collected data.

Research results states the complete regression equation as follows:

$$\mathbf{BP = 0.884 + 0.710AI}$$

The variable of Adoption Intention (Sig 0.000) is correlated with the dependent variable of Business Performance. Besides, the Unstandardized Coefficients B data showed that Adoption Intention (B = 0.751) has a positive effect on the dependent variable, which is Business Performance. As for the impact of the independent variables on the dependent variable, the normalized regression coefficient of the variable Adoption Intention is 0.751. Next, the group conducts the multicollinearity test, the VIF of the only independent value (1.000) is less than 2, so the variables have a close relationship with each other and there is no multicollinearity phenomenon.

6. CONCLUSION

6.1. Discussion

Vietnamese businesses recognize the significance of SDGs and the TOE Framework in the digital era. This study investigates the impact of technology, organizational factors, and the environment on business performance through 16 hypotheses, considering industry, business type, field, company age, and personnel count. The TOE framework offers insights into how technology, organizational culture, and the external environment shape a company's strategy, product development, and operations. It stresses leveraging existing technologies and embracing emerging trends for competitiveness. Collaboration among governments, corporations, and civil society organizations within the 17 SDGs framework is crucial for fostering a sustainable future. Vietnamese businesses can thrive by adopting the TOE Framework and aligning with the SDGs for sustainable development.

6.2. Implications

6.2.1. Theoretical Implications

The study introduces the “*TOE Framework for Vietnamese Business in the Digital Age based on SDGs*”, expanding the existing TOE framework to encompass SDGs, thus understanding the factors influencing digital transformation in Vietnamese firms. It stresses the significance of this framework in guiding technological decisions and exploring how its components interact to impact digital technology adoption, considering organizational, technological, and environmental factors.

The research holds theoretical implications for organizational strategy in the digital era, emphasizing the alignment of technical advancements with corporate goals and environmental sustainability. It recommends strategic integration of digital technologies to address social and environmental challenges faced by Vietnamese firms. Regarding policy implications, the study advocates creating a supportive environment for digital technology use aligned with SDGs in Vietnam's corporate and government sectors. It suggests integrating the TOE framework and SDGs into plans and laws to support sustainable digital transformation in Vietnamese companies. Additionally, the study offers practical frameworks to evaluate the alignment of digital transformation efforts with the SDGs, enabling businesses to implement sustainable and ethical practices.

6.2.2. Managerial Implications

The SDGs are crucial for businesses' long-term performance. They offer a framework to establish sustainability goals and gain a competitive edge. Utilizing SDGs improves brand reputation, trust, and sales. Governments must incentivize sustainable development, while entrepreneurs overcome legal issues. TOE framework's SDG integration boosts market share, profitability, and customer experiences. Vietnamese enterprises implementing sustainability receive government support, market potential, and rewards. The TOE framework has applications in social media, integrated platforms, data-driven solutions, and technology adoption. The study recommends using TAM for Vietnam's digital transition, validating its efficacy in explaining user adoption of self-service technologies.

6.3. Limitations

This research acknowledges limitations in relying on previous studies and the need for a comprehensive enterprise overview. It recognizes constraints and opportunities, but with a restricted scope. Applying findings to specific businesses in Vietnam is challenging due to diverse enterprise models. However, studying different models reveals patterns informing better business strategies. The study introduces two new factors to the TOE Framework, enhancing understanding of technology, organizations, and the external environment interactions.

The “*New Normal*” phase in Vietnam presents economic challenges and opportunities. The pandemic significantly impacted the economy, and the government aims for ambitious growth through recovery strategies. Staying well-informed is crucial for optimizing efficiency and considering broader implications on Vietnam’s stable economy.

6.4. Recommendations

Companies prioritizing sustainability plans must emphasize key functions based on their objectives. Organizational change is vital for success, achieved through raising stakeholder awareness, seeking external expertise, and adopting innovative processes or technologies. Huawei sets a corporate responsibility benchmark by investing in renewable energy and promoting workplace diversity and inclusion. Small actions like providing reusable cups to new employees enhance environmental impact. Larger projects, such as adopting power-saving technologies and constructing green ecosystems, can also be pursued. Huawei’s Environmental Report reaffirms its commitment to Environmental, Social, and Governance (ESG) principles, improving its environmental footprint and strengthening stakeholder relations through low-carbon campuses and eco-friendly practices across facilities, R&D labs, and factories.

THE IMPACTS OF TRADE LIBERALIZATION ON CLIMATE CHANGE OF ASIAN DEVELOPING ECONOMIES

Author: Duong Thuy Linh¹, Nguyen Phuong Ngan², Tran My Hieu², Phung Minh Anh², Tran Minh Anh²

Mentor: Nguyen Thi Mai²

ABSTRACT: To estimate the impact of trade liberalization on climate change, our study uses data from more than 50 countries in Asia from 1990-2020 in the World Bank. According to the GLS model result, trade openness has no significant impact on environment via methane (CH₄), carbon dioxide (CO₂), nitrous oxide (N₂O), and greenhouse gasses emissions (GHG), however based on creating the interaction variables from trade openness and income groups show that in lower-middle-income countries, trade openness has a much more significant positive impact on carbon dioxide emission than upper-middle income. Thus, the authors mention suggested policies in economic activities emphasizing on promoting the use of renewable energy and stricter environmental regulations on enterprises to alleviate negatively-affected environment by trade liberalization.

Keywords: Asia, carbon dioxide, climate change, GLS, trade openness.

1. INTRODUCTION

International trade allows countries to access international markets, thus expanding and improving productivity through the division of labor (Smith, 1776). In developing countries, where the biggest barrier is the small market, the benefit of international trade is that domestic producers have the opportunity to run their business in a larger external market (Thirlwall, 2000). In addition, the theory of comparative advantage holds that international trade is beneficial and brings production and consumption benefits to economies (Ricardo, 1817). Open economies can expand their domestic industrial sectors more quickly by importing inputs, technology and machinery from more advanced economies around the world, which in turn will have a positive effect on economic growth. In addition, Dollar (1992) found that per capita income increased at a significant rate for 16 Asian economies between 1976 and 1985 as Asia's exchange rate accelerated and has a positive relationship to economic development in Asia.

However, besides the great benefits in terms of economic development of countries, trade liberalization also has negative effects on the environment, especially climate change in countries around the world (Cole, 2004), especially in developing countries after the 2008 crisis (Emir and Bekun, 2018). Grossman and Krueger (1991) and Shafik (1994) propose a practical basis for the link between trade and the environment. Free cross-border trade has led to challenges to the global ecosystem. Li et al. (2015) found that trade openness is harmful to the environment in developing countries, especially in Asia. The increase in emissions from 2004 to 2011 was mainly due to increased domestic consumption, but the increase in emissions related to exports is also notable (McDuffie et al., 2020). In addition, according to the "Global Carbon Budget" report at the COP27 Conference, emissions from oil in 2022 are likely to increase by more than 2% compared to 2021, while emissions from coal, which are believed to have already peaked in 2014, will record a new record increase. For Asia, the relationship between the economy and climate change was studied by Khan et al. (2019) using the FMOLS (Fully modified ordinary least squares) model and gave

¹ Foreign Trade University, Email: k60.2112153081@ftu.edu.vn.

² Foreign Trade University

results about the causal relationship between environmental pollution due to CO₂ emissions and net foreign direct investment, investment among a number of other variables. It implies that FDI is found to have an adverse effect on environmental quality, supporting the pollution haven hypothesis in 17 Asian countries for the period 1980–2014. Another variable of trade openness in the CO₂ emission model was found to have a positive and serious impact on environmental pollution.

One common point between all previous studies is that there is still no clear distinction between developing and developed economies in the world. Different levels of development, thus using different production technologies and having different trade-offs between economic growth and environmental degradation, this view is expressed in the work of Khan, Ozturk (2019), focusing on the impact of FDI on environmental pollution in Asia, or in the study by Sun et al. (2019) analyzing the relationship between trade liberalization and climate change in 49 countries. has high emissions in the “Belt and Road” area. Trade liberalization will affect climate change in different ways, Bulus and Koc (2021) who studied the Pollution Haven Hypothesis (PHH) found that the impact of foreign direct investment (FDI) caused environmental degradation in Korea through increased emissions. However, according to Alex (2018), it was shown that energy consumption causes carbon emissions and this relationship is negative, specifically, a 1% increase in energy consumption will reduce 0.357% of energy consumption. carbon emissions. This negative impact can be explained by the decline in energy consumption intensity caused by the relatively recent increase in energy prices and the region’s commitment to adopting clean energy production.

Currently, research on the impact of trade liberalization on the environment in developing countries is still limited and mainly focuses on trade openness to carbon dioxide (CO₂). Recognizing the gaps that still exist in previous studies, the authors have chosen the topic: “Impacts of trade liberalization on climate change of Asian developing economies” in order to study the link between trade openness and climate change during and after the economic and global recession, thereby proposing some recommendations to contribute to mitigating climate change. developing countries in Asia in the context of trade liberalization.

2. THEORETICAL FRAMEWORK

As trade openness has been attributed to the speedy growth of world economic integration (Jun et al., 2020), more and more research has been conducted about its climatic impact on countries that joined and accelerated this trend. The key points from these articles about the affected-environmental quality are based on 3 main aspects: the Pollution Haven Hypothesis (PHH), the Pollution Halo Hypothesis (PHT) and the Environment Kuznets Curve (EKC).

With regard to the close relationship between the intensity of environmental policies and the potential resources in a country, the Pollution Haven Hypothesis, which was initially introduced by Copeland and Taylor (1994) in the context of North-South trade under the North American Free Trade Agreement (NAFTA) (Bulus and Koc, 2021). When trade barriers are reduced, pollution-intensive industries from countries with stringent environmental regulations will be transferred to countries with looser laws (Makiyan et al., 2022). More specifically, the PHH theory has the following basic explanation: developed countries usually set strict environmental standards. This will increase costs related to environmental protection, such as increasing production costs, management costs due to the need to strictly control inputs or establish standards for emission and increasing cost of changing individual technologies to handle waste... Therefore, in order to maximize profits, multinational corporations in pollution-intensive manufacturing industries will transfer their operations or some of them to branches in developing

countries with less stringent environmental regulations (Gill, Viswanathan, and Karim, 2018). On the other hand, the looser the environmental policies of developing countries are, the more they can attract foreign direct investment from contaminating manufacturers. This may lead developing countries to enter the “bottom race” and environmental pollution levels may also rise.

Contrary to the pollution haven hypothesis, the pollution halo hypothesis (PHT) suggests an opposite relationship between foreign direct investment inflows and environmental pollution (Atici, 2012; Balsalobre Lorente et al., 2019). This hypothesis stems from the ideas of Grossman and Krueger (1995), who analyzed the environmental impacts of foreign direct investment and GDP growth through three analytical mechanisms: scale effects, component effects, and technology effects. The spillover effect shows that positive externality originates from the potential of foreign direct investment to bring advanced technology transfer to the recipient countries (Vu Thi Thuy Kieu and Le Thong Tien, 2019). On the one hand, the economy is driven by the growth of foreign direct investment (FDI), which in turn increases people’s awareness of environmental quality, corresponds to the increase in income, and promotes the process of utilizing new green and clean resources. On the other hand, the import of advanced technology, the application of higher environmental standards, the development of mining tools, and green production also contribute to improving the environmental quality of recipient countries (Zarsky, 1999; Asghari, 2013; Bruce and Roberts, 2017). In many studies, PHT has been proven to improve environmental quality in the BRICS countries (Tamazian et al., 2009), the United States (Eskeland and Harrison, 2003), and China (Liu and Kim, 2018). In addition to supporting the PHT theory, there are also experimental findings opposing PHT (Millimet and Roy, 2016; Neequaye and Oladi, 2015; Chung 2014). But overall, PHT theory provides valuable discoveries and foundations for environmental and economic growth theories.

Another aspect is the Environment Kuznets Curve (EKC), which became the main concept defining the relationship between income and environmental degradation in the early 1990s. Grossman and Krueger (1991), Shafik and Bandyopadhyay (1992) conducted their first experimental study on EKC and found a nonlinear inverse U-shaped relationship between income and pollution. The EKC hypothesis suggests that in the early stages of economic development, industrialization and urbanization deplete natural resources and generate urban as well as industrial waste. At this stage, there is a positive relationship between economic growth and pollution. As industrialization continues, technology has improved and services have expanded, resulting in a decrease in pollution (Panayotou, 1993). The basic message of EKC is to “develop first, sustainable after”. The way to “develop first, sustainable after” of EKC’s has put the world at risk of environmental changes, including global warming and climate change. In summary, although there are many different viewpoints around EKC, it is undeniable that EKC is an important and meaningful theory in economic and environmental issues.

Generally speaking, trade openness has a direct and indirect impact on the environment, thus the topic of the correlation between trade liberalization and the environment has been discussed controversially. However, the number of studies on trade openness and climate alteration by measurement of methane, nitrous oxide is still limited. The previous research is mainly concentrated on economic growth, FDI and lack of other vital factors such as renewable energy consumption and energy use.

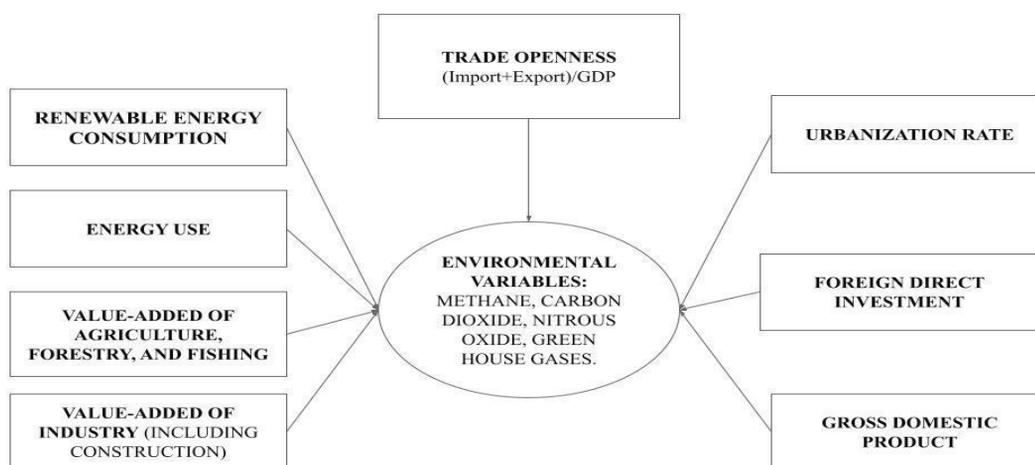

Diagram 1. Theoretical Framework

3. RESEARCH METHOD

Gujarati (2015) recommends starting with the three models: pooled ordinary least squares (POLS) regression model, the fixed effects model (FEM), and the random effects model (REM)) and performing hypothesis testing to find the most suitable one, but there exist other worth-considering models, Generalized Least Squares (GLS) typically. In this study, the authors will perform regression on all models and choose the one that best suits their research. The variables are listed in table 1.

The formula showing the relationship between trade liberalization of the economies and 4 dependent variables of climate change: CO₂, CH₄, GHG, N₂O:

$$X_{it} = \beta_{1it} + \beta_{2it} * ope_{2it} + \beta_{3it} * int_{23it} + \beta_{4it} * int_{34it} + \beta_{5it} * lnagri_{5it} + \beta_{6it} * lnen_{6it} + \beta_{7it} * rne_{7it} + \beta_{8it} * lnind_{8it} + \beta_{9it} * urb_{9it} + \beta_{10it} * lngdp_{10it} + \beta_{11it} * lnfdi_{11it} + \beta_{12it} * yr_{12it} + \beta_{13it} * inc_{13it} + u_{it};$$

Given X = {co₂; lnch₄; lnghg; lnn₂o}.

Table 1. Sources and description of study variables

Variables	Description	Expected Sign	Research Source	Data source
Dependent variables to measure climate change				
co2	Carbon dioxide emissions, in metric tons per capita		Bulus and Koc (2021)	WB
lnn2o	The natural logarithm of nitrous oxide emissions in the energy sector, thousand metric tons of carbon dioxide equivalent		Onwachukwu et al. (2021)	WB
lnch4	The natural logarithm of methane emissions in the energy sector, in thousand metric tons of carbon dioxide equivalent		Ali et al. (2020)	WB
lnghg	The natural logarithm total greenhouse gas emission, in kt of carbon dioxide equivalent		Nemati et al. (2018)	WB
Independent variable				
ope	Trade openness (the total ratio of exports and imports of goods and services to the gross domestic product as a percentage)	+	Soylu et al. (2021)	WB
int2	int2=inc2*ope (middle-low income * trade openness),	+	Kazemi and Mousavi (2015)	WB
int3	int3=inc3*ope (middle-high income * trade openness)		Li and Haneklaus (2022)	WB
lnfdi	The natural logarithm of net foreign direct investment inflows, measured by percentage of foreign direct investment over gross domestic product	+	Onwachukwu et al. (2021)	WB

Variables	Description	Expected Sign	Research Source	Data source
lngdp	The natural logarithm of the number of gross domestic product per capita, in current US\$	+	Bengoa et al. (2021)	WB
urb	The ratio of urban population to total national population, in percentage	+/-	Ali et al. (2020) Xu et al. (2018)	WB
rne	Renewable energy consumption over total final energy consumption, in percentage	-	Soylu et al. (2021)	WB
lnen	The natural logarithm of the energy consumption, in kg of oil equivalent per capita	+/-	Sun et al. (2019), Khoshnevisan et al. (2013)	WB
lnagri	Agriculture, forestry, and fishing, value added, in current US\$	-	Orhan et al. (2021)	WB
lnind	Value-added of industry (including construction), in current US\$	-	Jebli et al. (2020)	WB
yr	yr=1 if year>2007, yr=0 otherwise	-	Wang and Wang (2021)	WB
incit	incit is a dummy variable with: low income country then i=1, lower middle income country then i=2, upper middle income country then i=3, high income country then i=4	+	Yao et al. (2019)	WB

The data is collected mainly from the World Bank. The dataset provides a wealth of data at the global level, enabling the research team to conduct analysis and testing across 50 countries in Asia, from 1990 to 2020. Data were processed to ensure consistency in research data. However, the data of some economies in some years are omitted and fall short of estimates. The authors have overcome this by finding more reputable data sources with more complete information such as: Statista, BP, ..., thereby increasing the accuracy of the research model.

In addition, according to Wang et al. (2022), Asian emerging economies underwent a global economic crisis in 2007, influencing these countries' total import value, export value, and GDP. In order to clarify the effects of trade openness and other factors on climate change throughout different situations, the author group splits the study period into two phases namely during and after the global recession, applying income and year as dummy variables.

4. RESULTS AND DISCUSSION

4.1. Results

4.1.1. Descriptive statistics

Before performing regression analysis, the author performs descriptive statistics on the variables in the mentioned research model. Table 2 presents the descriptive statistics for the variables included in the model.

Table 2. Descriptive statistics of variables in the model

Variable	Obs	Mean	Std. Dev.	Min	Max
lnch4	1,365	8.6679	2.3647	2.3026	13.9778

Source: The authors (2023)

Descriptive statistics table includes 16 variables, among which *ch4*, *co2*, *n2o*, and *ghg*, the value-added of agriculture, forestry, and fishery industry (*agri*), energy use (*en*) and industrial added value (*ind*) are variables that possess relatively large standard deviations, causing disproportions in the overall value. Therefore, the authors decided to take the natural logarithm of these variables to gain normal distribution. Looking at the detail, the standard deviations and net levels of dependent variables, consisting of *lnch4*, *lnn2o*, and *lnghg* lie in the range of around 2 and 11 respectively, while their values for average mean vary widely. Regarding independent and control variables, *trade openness (ope)* shows the largest net value among the variables, with 61.14 and the second largest standard deviation after *co2*. This indicates that trade openness has a widespread dispersion among Asian developing countries. *the net inflows of foreign direct investment (lnfdi)*, *gross domestic product (lngdp)*, *the value-added of agriculture, forestry, and fishery industry (lnagri)*, *energy use (lnen)* and *the value-added of industry (including construction) (ind)* show a considerable disparity in their net values, as well as mean numbers. However, these variables all have comparable standard deviations, ranging from 1.16 of *energy use (lnen)* to 3.0 of *gross domestic product (lngdp)*. Except for *the net inflows of foreign direct investment (lnfdi)*, the four variables *gross domestic product (lngdp)*, *the added value of agriculture, forestry, and fishery industry (lnagri)*, *energy use (lnen)* and *added value of industry (including construction) (lnind)* all have bigger average mean values than *trade openness (ope)*.

Among all variables, *lngdp* holds the largest average value of 24.74, while *the net inflows of foreign direct investment (lnfdi)* average value, the only below-zero average value, is the smallest at -3.967. Regarding the standard deviation of the examined variables, *co2* has the highest number of 7.88, and *the urbanization rate (urb)* has the lowest with 0.26. This implies that there is a large disparity in the carbon dioxide level among developing Asian nations and regions, meanwhile, a subtle urbanization dispersion is witnessed among the research countries.

A model where the independent variables satisfy the condition of being not correlated with each other is an ideal model, denoting that each independent variable carries exclusive and non-repeated information about the dependent variables. To effectively examine the correlation between the dependent variables and independent and control variables in the model, the correlation coefficient matrix of variables in the model will be applied. The results explain that the correlation coefficient between the pairs of explanatory variables in the model is less than 0.8. Therefore, it can be concluded that the two dependent variables are not strongly correlated with each other and that there is no multicollinearity in the model.

4.1.2. Model testing

Several tests have been performed in this study to investigate defects in regression models. Variance Inflation Factor (VIF), Modified Wald test, and Wooldridge test are used to analyze the level of multicollinearity, heteroskedasticity, and autocorrelation of variables in the model.

Before ending up with the GLS model, the study had conducted the F test and Hausman test to opt for the most suitable model among Pooled OLS, FEM, and REM. However, due to the presence of heteroskedasticity and autocorrelation mentioned above, GLS is used for the result discussion of the four models in this study.

4.1.3. Model results measuring the impact of trade liberalization on climate change

This study analyzes the impact of trade liberalization on climate change through the interaction between four dependent variables regarding pollutants and independent variables relating to economics as the table below:

Source: The authors (2023)

It can be seen from the table 3 that trade openness (ope) does not have a considerable impact on the emission of methane, carbon dioxide, nitrous oxide, and greenhouse gasses. This result is consistent with the study of Ansari *et al.* (2019) indicating that trade openness is statistically insignificant for Iran, the UK, Australia, France, and Spain on *co2* as the increase in *co2* due to higher rates of production resulting from freer trade (scale effect) is compensated by the impacts of changing industrial structure towards environmentally friendly activities (composition effect) and the use of cleaner production processes (technique effect). The result is also consistent with the study of Jayanthakumaran *et al.* (2012) and Farrhani and Shahbaz (2014), indicating that in the early stages of economic development, emissions including CO2 will increase because in this period most modern technologies have not been widely applied. At the same time, the government also tends to prioritize policies on economic development, leading to increased emissions along with economic activity, especially in big cities. However, when the economy grows to a certain point, the government pays more attention to environmental issues by giving priority to sustainable development projects, tightening environmental laws. Besides, the research results of Sun (2019) also show that trade openness actually has a positive impact on the environment in European countries but not in Asia because countries in The European region is shifting its pollutant-intensive industries to emerging economies with lax or non-existent environmental regulations.

Source: The authors (2023)

In this study, authors create two interaction variables based on trade openness and income groups. The aim is to analyze the difference in the impact of trade openness on *lnch4*, *co2*, *lnn2o*, and *lnghg* in different groups of income levels. The two new variables *int2* and *int3* represent the middle income groups. The table 4 shows that the two interaction variables are statistically significant.

The interaction variable *int2*, which is calculated by lower-middle income x trade openness, has a positive impact on *co2* at a 5% significance level, which is similar to the impact of variable *int3*, which is measured by upper-middle income x trade openness. However, this impact in lower-middle-income countries is more than double that in upper-middle-income countries. This is due to the scale effect of trade openness and the fact that at the early stage of development, more attention is paid to growth than the quality of the environment, which is according to Ali *et al.* (2020).

In addition, the authors have created a variable *yr* to identify the pattern between emissions of four kinds in the pre-recession period and the post-recession period. From the result, in the post-recession period, greenhouse gasses emissions in Asian countries have been decreasing. This result is similar to the study of Nemati *et al.* (2021) in which greenhouse gasses emissions reduce in the long run under the influence of free trade agreements between developing countries.

Besides, *the net inflows of foreign direct investment (lnfdi)* have a significant negative impact on emissions of *lnch4* and *lnghg* at the significant level of 5%, which is similar to renewable energy consumption at a 1% significant level. The increase in *lnfdi* or *renewable energy consumption (rne)* will lower *lnch4* and *lnghg*, holding all other factors unchanged; this finding is similar to Paul *et al.* (2021) that concludes *lnfdi* had a negative impact on *lnch4*. However, renewable energy also has a significant negative impact on *lnn2o* and a positive impact on *co2*, both at the level of 1%. The result of *rne* impact on *lnn2o* is in line with the study of Sinha *et al.* (2019). The result of the positive impact on *co2* is in line with the research of Soylu *et al.* (2021).

From table 4, we can also conclude that GDP has a significant positive impact on the emissions of nitrous oxide and greenhouse gasses at 1% and 5% significant levels, in turn. This result is the same as the results examined in Higher-income OIC countries by Ali, S. *et al.* (2020). Regarding *the urbanization rate (urb)*, it is significant at the level of 5% for *co2* and 1% for the remaining 3 pollutant emissions. Holding other factors the same, the more the urbanization rate is, the more emissions of carbon dioxide and greenhouse gasses are while there will be fewer methane and nitrous oxide emissions. This is consistent with the study of Li, B. and Haneklaus, N. (2022), saying that a 1% increase in the long term causes a change in urbanization in the form of a 1.27% decrease in *co2* at a 1% significance level.

Energy use, the value-added of agriculture, forestry, and fishery industry (lnagri) and *the value-added of industry (including construction) (lnind)* all have a significant impact on four pollutant emissions at a 1% significance level. But it is noticeable that *energy use* impacts them positively while *lnind* impacts them all negatively.

It is noticeable that there is a difference in the impact of trade openness on *ch4* and *lnghg* in lower-middle-income countries and higher-middle-income countries. Whereas the impact is insignificant in lower-middle-income countries, *ope* has a negative impact on the two pollutant emissions at a 5% level of significance. If all other factors are unchanged, an increase of 1% in trade openness leads to a decrease of 0.3090% and 0.1550% for *lnch4* and *lnghg*, respectively.

4.2. Discussion

As shown in the above results, the authors conclude that the general air quality of Asian developing countries suffers from negative effects when trade liberalization is widely adopted. To clarify the claim above, the authors discovered that: i) Trade activities in Asian countries with different income levels contribute significantly to the increased CO₂; ii) Increasing urban population in an area equals the speed of the area's urbanization rate, leading to rising air pollution from construction, factories, and daily transportation; iii) The more people living in urban regions, along with higher overall energy use, the worse the air quality evolves, making allergies and respiratory problems a huge health hazard; iv) The value-added of agriculture, forestry and fishery industry also mitigate emissions intensity and contribute to cutting the greenhouse-gas emissions but this requires technology application, and consent of principles of sustainability; v) Industries and investors still exploit resources in high-income economies, making carbon emission worsened despite environment policies. As trade liberalization continues, high-income countries incline to invest and conduct more economic activities in low-middle and upper-middle-income countries to avoid a solid legal system.

5. CONCLUSION

The regression results indicate that trade openness solely does not have a considerable impact, yet when in combination with income levels then trade openness shows statistical significance on the climate in developing Asian economies surveyed. To be more specific, while trade openness tends to decrease the amount of emitted methane and greenhouse gases in countries with upper middle income, it leads to higher

emissions of carbon dioxide in both lower middle income and upper middle income nations. Therefore, to lessen the burden on the atmosphere brought about by trade liberalization, governments and policy makers must reckon with the downsides of trade openness on the atmosphere, then alter policies on economic activities and implement environmental protection measures in the most effective way. The authors propose the following recommendations:

In terms of energy consumption and infrastructure, policymakers should reduce air pollution by cutting down the usage of fossil fuels and upgrading greener energy use. With the innovative wave brought by trade openness, authorities should make the most use of it to innovate infrastructure and machines using renewable energy, as well as accelerating electrification process on multiple energy resources. Authorities should renew propositions and improve alternative transport systems in urbanisation areas and moderate-large urban areas, also work with people's awareness onto accepting environmentally friendly public transport systems instead of private vehicles.

In terms of financing and investing, trade openness should also undergo careful censorship by authorities, based on a greener and more sustainable approach. Additionally, trade barriers on producing green and environmentally friendly products should be removed to encourage minimum-cost green innovation. National budgets should be partially spent to invest in modern manufacturing technology and equipment so as not to cause high pollution as well as strictly comply with environmental regulations. Moreover, policies and laws should incorporate stringent regulations, responsibilities on foreign direct investments for investors and investees to ensure environment protection measures, as well as the level of tax payment based on the amount of emission their work has produced.

In terms of acts on consolidating social behaviors, settlement structure and employment distribution should be modified in conformity with ecological volume of the area, meaning re-distributing the working and accommodation system to smaller urbans to lessen burdens on large urban's atmosphere during urbanisation. On top of that, a rising number of public-private cooperation plans, including enterprises, government or social organizations, should be carried out in the field of waste treatment and management, aiming at developing people's awareness and their voluntary behaviors in behalf of the environment.

With the efficiency of the GLS model, this study has combined the prerequisite variable, which is trade liberalization, with income level variable and resulted in new and comparative findings on this trade liberalization - climate change topic. However, further reliable data or some other models can also be examined in the future to alleviate limitations of lacking data and strengthen the knowledge of the trade liberalization's impact on the environment.

HOW DOES TRADE OPENNESS AFFECT PRIVATE INVESTMENT? A GLS APPROACH

**Author: Truong Nguyen Thuy Duong¹, Nguyen Anh Ngoc², Vuong Bao Ngoc²,
Nguyen Tran Phuong Uyen², Mai Nu Song Ngan²
Mentor: Nguyen Thi Mai²**

ABSTRACT: Using GLS regression, the study examines the influence of trade openness on private investment in 33 developing Asian countries from 2001 to 2019. The dependent variable in the study is especially presented in two forms, corresponding to two measurements of private investment. Results show that trade openness has positive impacts on investment activities of the private sector. Besides, for the first time, through the use of interactive variables, the impact of trade openness on private investment (1) in high-income Asian developing countries, (2) in countries following constitutional rules, and (3) in the post-recession period are measured. From the results, it indicates that the private sector credit, net foreign direct investment inflows, broad money supply, GDP growth rate, population, high income countries, the post-recession period, the constitutional rules and inflation affect private investment positively. On the other hand, the negative impact is found in the foreign reserves. The results provide policy recommendations to the government and stakeholders, such as expanding export markets, boosting the competitiveness of domestic production, and efficiently regulating capital.

Keywords: Asia; developing countries; GLS regression; private investment; trade openness.

1. INTRODUCTION

One of any nation's top priorities should be to encourage private sector investment, which contributes to economic growth by generating production, revenue, and employment inside the nation. Additionally, productivity in the private sector is guaranteed by ongoing monitoring and assessment. Therefore, developing the private sector as a strategy to increase economic activity in developing countries to help promote economic growth and reduce poverty has begun to gain credibility in the years since 1980 (Ouattara, 2004).

It is crucial for planners and policymakers to be aware of the factors that influence private investment. Since many years ago, economists have regularly argued how trade liberalization and the country's economic circumstances may both significantly increase private investment. In which, trade openness can be one of the factors that help improve the quality of economic development (Raghutla, 2020). In addition, there are other factors that affect private investment in developing countries, among them are GDP growth, real exchange rate, public investment, real interest rate, public debt, and uncertainty (Serven & Solimano, 1993). However, Bibi et al (2012) show that trade openness has a detrimental effect on domestic investment in Pakistan because it increases the opportunity for capital outflows from the economy.

Nowadays, Asia has quickly emerged as a leader in the private market investment field, notably in the growth stock sector. The value of deals in South Korea, Southeast Asia, and Japan is more than quadrupled, and each nation in the region established new investment records. Private investment pledges are expected to reach \$76.2 billion in low- and middle-income countries in 2021, increasing 49% from 2020 (World Bank, 2022).

Generally, previous studies have analyzed the factors affecting private investment. Differences in results are explained by differences in geography, methods of data use, and duration of observations. In addition, examined studies show long-term and short-term effects to make a difference. Therefore, this

¹ Foreign Trade University, Email: truongnguyenthuyduong2011115115@ftu.edu.vn

² Foreign Trade University.

article uses a variety of indicators from 33 countries and data spanning 19 years to compare sharp differences and comparisons between countries in the same region.

This topic about the impact of trade openness on private investment has drawn a lot of attention and our study has some contributions as follows. First, the research is conducted on a large scale expanding 33 Asian developing countries in 19 years. Among a few topics investigating this causality, none has gone into deep research at such scale. Second, two dependent variables corresponding with two ways of measuring private investment, which means four models in total, were observed to produce the most accurate result. Third, the model is supplemented with interactive variables to clarify the impact of trade openness on private investment in specific situations: before and after the economic crisis in 2008, in high-income developing countries in Asia and in politically stable developing countries in Asia.

Regarding the practical contributions of our study, the research has clarified the relationship between trade openness and private investment in Asian developing economies in the period from 2001 to 2019. This would be a significant contribution in the context that many Asian nations under investigation have been recently emerging as dynamic developing countries and private investment has been proven to play a key role in that development. From the research results as well as the recommendations on the topic, policymakers and businesses in developing countries in Asia will have more references to come up with effective strategies and approaches to make the most of the relationship between trade openness and private investment. The rest of the article is presented as follows. The relevant literature will be reviewed in section 2 from which the framework of the analysis is provided. Section 3 presents the data system and evaluation method the group has chosen. The results of the method will be presented in Section 4. Section 5 is responsible for making conclusions and recommendations.

2. THEORETICAL FRAMEWORK

Trade openness is an important index in evaluating the statement of a national economy. OECD (2011) mentions it as an index used to evaluate the importance of foreign trade in comparison with domestic trade. Trade openness is assumed to be a potential factor for having an impact on private investment. Private investment is considered as the private sector's purchase of a capital asset that is expected to create profits and add value in the future (Marcos, 2019). Because of their important roles in the economy, many researchers work on analyzing the effect of trade openness to private investment.

In further research, the researchers come up with different conclusions about how trade openness affects private investment. The results could be divided into two main types: positive and negative. A typical research that confirms the positive effect is the study of Naa-Idar et al (2012) about 30 African countries. This research mentions that in the long term, trade openness brings beneficial contributions to private investment, and therefore free trade policy should be enhanced. Mohsen (2015) mentions that trade openness is helpful for acquiring machines and production inputs that can be used in the production activities. In addition, increasing exporting abroad motivates the private sector to improve and increase its production. By using the technique of estimating the distribution delay (ARDL), Suleman et al. (2020) analyze the factors that are significant to the rise of private investment in Pakistan from 1974 to 2013. The study revealed that trade openness encourages private investment through uplifting the export and import of capital goods and latest technology which motive domestic investment. Drawing the same conclusions as Suleman, Boachie et al (2020) used the IMF database to show that financial development and trade openness have a significant positive impact on regional investment. India's private sector, both in the long and short term. However, the impact of the correlation between financial development and trade openness on private investment is significantly negative, indicating that the impact of financial development on private investment depends on the open level. Therefore, if India

is to promote the formation of private sector capital for job creation, care should be taken in designing policies to allow financial development as well as open trade to coexist.

In contrast with these authors, other researchers state that there are cases where trade openness has a negative effect on private investment. Among them, the study of Asante (2000) shows that trade policies have a negative impact on private investment. For a country with a history of being controlled like Ghana, policies such as trade closures, overvalued exchange rates, lack of foreign exchange, etc. have hindered the development of import and export, have a profound impact on trade openness. The work of Hye & Lau (2018) came up with a contradictory result to Sulemant et al. (2020) when the ARDL model pointed out that 1% increase in trade openness lowered private investment by 3.162%. The explanation for this phenomenon is that Pakistan is still a raw material exporter with low income in export. The study of Frimpong & Marbuah (2010) about private investment of Ghana suppose the possibility of negative effect from trade openness. The development in trade brings advantages for export and increases competitiveness and productivity. In-depth research in the service sector, Abbas (2022) makes the following statement: private investment in services is significantly encouraged by the growth of value added output of the service industry (GVAS), credit capacity private employment (PC), GDP growth (G), physical infrastructure (PI), remittances (REM) and foreign direct investment (FDI). However, public investment in services (ISPUB) and trade openness (OP) discourage private investment in this sector.

The research framework focuses on how private investment is affected by trade openness. To get reliable results, we also analyze other factors that may have potential effects, which are social - economic characteristics and economic index. To estimate the effect, private investment is represented in two forms: value in USD and ratio of private investment to GDP.

3. RESEARCH METHOD

3.1. Data

To conduct our research, data from 39 developing economies in Asia were collected. According to IMF (2022), developing countries are classified based on 3 main criteria: per capita income, export diversification, and the level of union with the global financial system, The list includes Armenia, Azerbaijan, Bahrain, Bangladesh, Bhutan, Brunei, Cambodia, China, Gruzia, India, Indonesia, Iran, Iraq, Jordan, Kazakhstan, Kuwait, Kyrgyzstan, Laos, Lebanon, Malaysia, Maldives, Mongolia, Myanmar, Nepal, Oman, Pakistan, Philippines, Qatar, Saudi Arabia, Sri Lanka, Syria, Tajikistan, Thailand, Timor Leste, Turkey, Turkmenistan,

Uzbekistan, Vietnam, Yemen; however, Democratic People’s Republic of Korea is not included due to the missing of data. Data was collected from international statistics institutions such as World Bank, IMF and Penn World to ensure accuracy and consistency of measurement. The majority of data was collected from the World Development Indicators of the World Bank and the World Economic Outlook of the IMF.

Although the authors have made the best effort to gather data, missing data for some variables over a few years is inevitable. However, appropriate techniques have been adopted to overcome the data problem, ensuring an accurate result. That leaves us with 462 observations across 33 countries in the period of 19 years from 2001-2019. The steps of checking, processing, and cleaning data such as removing outliers, descriptive statistics, and standard distribution tests have also been conducted.

3.2. Research models

The quantitative research model aims to study the impact of trade openness on private investment in developing Asian countries. This model is based on the work of Boachie et al. (2020) and incorporates previous studies such as Sakyi et al. (2016) and Mbaye et al. (2014). The dependent variables in this study represent private investment and can be either the natural logarithm of private investment (lnpri) or private investment/GDP (prig). The independent variables include trade openness (ope), inflation rate (inf), public investment/GDP ratio (pui), relative price index of investment goods (rpi), broad money supply (brm), economic growth rate (gdp), net foreign direct investment (fdi), private sector credit (prc), foreign exchange reserves (lnfre), and population (lnpop). Model (2) incorporates interaction variables to observe changes in the model, including three interaction variables measuring trade openness in high-income countries (int1), countries with constitutional reforms (int2), and the post-recession period (int3).

The following is the estimated econometric model, with t representing the usual error term, 0 as the intercept coefficient, ln indicating the natural logarithm, and t as the time. The variables are described in Table 1.

$$pri_t = \beta_0 + \beta_1 open_t + \beta_2 inf_t + \beta_3 pui_t + \beta_4 rpi_t + \beta_5 brm_t + \beta_6 gdp_t + \beta_7 fdi_t + \beta_8 prc_t + \beta_9 lnfre_t + \beta_{10} lnpop_t + \beta_{11} hic_t + \beta_{12} pol_t + \beta_{13} yea_t + \mu_t \tag{1}$$

$$pri_t = \beta_0 + \beta_1 open_t + \beta_2 int1_t + \beta_3 int2_t + \beta_4 int3_t + \beta_5 inf_t + \beta_6 pui_t + \beta_7 rpi_t + \beta_8 brm_t + \beta_9 gdp_t + \beta_{10} fdi_t + \beta_{11} prc_t + \beta_{12} lnfre_t + \beta_{13} lnpop_t + \beta_{14} hic_t + \beta_{15} pol_t + \beta_{16} yea_t + \mu_t \tag{2}$$

Source: Synthesized by the author (2022)

This study analyzes panel data from 43 Asian developing economies, including Saudi Arabia, Afghanistan, India, Bahrain, Bangladesh, Bhutan, Brunei, Cambodia, East Timor, Fiji, Hong Kong, Korea, Indonesia, Iran, Iraq, Israel, Jordan, Kiribati, Kuwait, Laos, Lebanon, Malaysia, Maldives, Mongolia, Myanmar, Nepal, Oman, Pakistan, Papua New Guinea, Philippines, Qatar, Samoa, Singapore, Solomon Islands, Sri Lanka, Syria, Thailand, Turkey, Taiwan, North Korea, and Palestine were excluded due to a lack of data on the FDI variable. The data set spans the years 2000 to 2020. The data is primarily from the World Bank and has been processed to match the properties of the variables in the quantitative model, ensuring consistency and uniformity. During the processing, some economies' data for a few years were missed and did not meet the estimate, so the authors excluded them from the model.

In addition, according to Laura Diaconu (2014), Asian emerging economies underwent a global recession from 2007 to 2009, which impacted the region's FDI inflows. The primary cause is that developed economies such as the United States and Europe ceased lending, disbursing or withdrawing capital. In order to clarify the fluctuation of the effects of FDI and other factors on climate change throughout different situations, the authors split the study period into 3 parts namely before, during, and after the global recession using dummy variables.

4. RESULTS AND DISCUSSION

According to the Wooldridge, White, and VIF tests, the Pool OLS models for those with lnpr and prig as dependent variables have autocorrelation, heteroscedasticity, but no multicollinearity problem. The F test for the model with the dependent variable lnpr and prig variable yielded p-values of $F < 0.010$, leading to the rejection of H_0 at a 1% significance level. Additionally, the Hausman test produced chi2 values of 141,450 and 38,480, respectively, with corresponding probabilities of 0.000 and 0.0002, both rejecting H_0 at the 1% significance level. These outcomes indicate that FEM models are more reliable than Pooled OLS and REM. After the Wooldridge and White tests, the results show that these two FEM models have heteroscedasticity and autocorrelation issues. In previous research on the determinants of private investment, such as that

of Mbaye (2014), endogeneity does not appear and is not mentioned in the relationship between private investment and its determinants. Therefore, GLS regression was conducted in order to solve the problems of heteroscedasticity and autocorrelation, and the results are presented in table 2 and 3.

GLS regression is employed as Wooldridge (2015) suggests that to address the issue of heteroscedasticity (i.e., differences in the variance of observed units), it uses a weight matrix to adjust the variance of the error in the data by assigning weights to the observations. The weights are increased for observations with smaller variance and decreased for observations with larger variance, thereby adjusting for differences in variance. This approach helps overcome the phenomenon of heteroscedasticity. Moreover, the weight matrix from the GLS regression also adjusts the correlation structure of the residuals, which helps address the issue of autocorrelation. Therefore, by using GLS regression, the accuracy of regression models can be improved and more reliable estimates are obtained.

Trade openness. Increasing trade openness has a positive and statistically significant impact on private investment in developing Asian economies. Model (3) shows the strongest effect, with a significance level of 1%, while models (1), (2), and (4) also show significant effects at the 5% level. This suggests that an increase in trade openness is likely to lead to a corresponding increase in private investment, as evidenced by the findings presented in tables 2 and 3. The observed relationship between trade openness and private investment can be attributed to several factors. One possible explanation is that opening up the economy to international trade, through trade liberalization and other measures, can help attract investment from the private sector. Attefah & Enning (2016) suggest that increased international trade creates favorable conditions for private investment, as businesses are able to generate higher profits and expand their operations.

Le & Pham (2020) also support this view, arguing that greater trade openness provides businesses with more opportunities to interact with the global economy, leading to increased profits and investment. Additionally, promoting export activities and importing necessary materials and machinery can facilitate the development and adoption of new technologies, further enhancing the competitiveness of domestic businesses (Mbaye, 2014; Prabir, 2012). Moreover, the simplification of import and export procedures that typically accompanies increased trade openness can also encourage private investment by making it easier for businesses to access new markets and secure necessary resources (Mugumisi, 2021). These findings are consistent with previous studies by Ajide & Lawanson (2012), Naa-Idar et al. (2012), Mbaye (2014), and Mohsen (2015), but differ from Oshikoya (1994) and Servén (2003).

To examine differences in private investment levels between countries based on income, political institutions, and the post-2008 financial crisis period, the author employed interactive variables *int1* (trade openness x high-income nations), *int2* (trade openness x constitutional rules), and *int3* (trade openness x post-recession period). The results (table 3) found that high-income nations experience greater private investment increases due to their access to modern technology and high-quality workforces (Polpibulaya, 2015). However, increased trade openness in nations with constitutional political systems may decrease private investment (table 3). Investors may refrain from conducting investment activities in countries where the business environment is perceived as risky or where the investment conditions are not favorable. This is often the case in countries with poor institutions or high levels of corruption, such as Nepal, where supervisory authorities fail to effectively enforce corruption reductions, resulting in the country being ranked low in various international corruption indices (Shrestha, 2019). Furthermore, Haque's (2020) research suggests that an underdeveloped regulatory environment in the financial sector can also make investors hesitant to engage in investment activities. Moreover, post-recession period's increase in trade openness may result in reduced private investment, possibly due to the time needed for economies to recover after a recession, coupled with the private sector's reduced investment demand as sales prospects remain uncertain (Parisotto, 2009).

Several other control variables have been shown to be statistically significant in explaining private sector investment. An increase in the *inflation* promotes private investment at the 1% significance level (table 2 and 3), thereby deviating from the predictions of both the authors and most previous empirical studies, such as those by Gebremariam (2019) and Nguyen (2021). Nevertheless, there are some studies that report similar results to our findings. Frimpong & Marbuah (2010) and Attefah & Enning (2016) found a positive relationship between inflation and private investment in Ghana, while Acosta & Loza (2005) reported similar results for Argentina. The reason for this positive relationship in Ghana may be attributed to the fact that higher prices stimulate production and supply, leading to increased income and, in turn, more private investment (Attefah & Enning, 2016). Additionally, Jin & Zou (2005) suggest that inflation can promote saving and investment activities, while an increase in prices can boost the investment capital of private sector projects.

The findings reveal that *the ratio of M2 (broad money supply) to GDP* exhibits a positive impact on private investment. This is consistent with previous studies by Fu & Liu (2015) and Teklay (2017), which also discovered a positive association between M2/GDP and private sector investment in Ethiopia, when an increase in the money supply improves the financial conditions of consumers and companies, leading to lower lending rates, increased availability of credit to private investors, and this has stimulated investment activity. Additionally, *private sector credit/GDP* is found to influence private investment positively, indicating that development in the financial sector will promote private investment. This result is similar to that of Frimpong & Marbuah (2010), and Okorie & Chickwendu (2019). The results also highlight that private investment is positively affected by *net FDI inflow*. This finding aligns with the results from

Oloyede & Ejemeyovwi (2012) and Nguyen (2021), which found that capital from FDI activities can help supplement private investment, because then, domestic enterprises can cooperate with foreign enterprises as contractors for them, partners in the joint venture. investment business or raw material supplier.

Moreover, results reveal *economic growth* in developing countries in Asia can boost private sector investment. This is consistent with the research of Suhendra & Anwar (2014), which suggests that the positive relationship between economic growth and private sector investment can be explained by the development and expansion of production activities. As manufacturing industries grow, the output of goods and services in the domestic market increases. If the domestic market cannot consume all the products provided by the manufacturing industries, they can be sold to foreign markets, leading to increased levels of exports. This, in turn, can encourage private sector investment activities. These findings are consistent with those of Boachie et al. (2020), who also reported a positive relationship between economic growth and private sector investment.

The *population* is also found to have a positive effect on private investment, which is consistent with the findings of Mohsen (2015). Accordingly, the increase in population will increase the source of labor, as well as the demand for goods and services will also increase, and this will motivate manufacturers to increase output. goods and services. As a result, population growth can increase private sector investment (Mohsen, 2015). Furthermore, our results show that *dummy variables for the post-recession period and high-income countries* have a significant and positive impact on private investment. According to the studies conducted by Greene & Villanueva (1990) and Eyraud et al. (2021), there is a positive relationship between the value of private sector investment and income levels of countries. Specifically, their research suggests that countries with higher income levels tend to experience greater private sector investment. Finally, we find that *constitutional political institutions* have a positive effect on private investment in all models, which is consistent with the findings of Frimpong & Marbuah (2010) and Naa-Idar et al. (2012). Naa-Idar et al. (2012) have found that a smoothly operating constitutional system, coupled with well-resourced and effectively supervised state and quasi-state agencies, can provide a crucial link to the growth of private investment in Ghana. The study suggests that any unconstitutional overthrow or military takeover of the government may have negative consequences on private investment, as it can create an unfavorable environment for foreign investors and investment activities.

5. CONCLUSIONS

5.1. Conclusions

The study has demonstrated how trade openness influences investment activities of the private sector. In that process, other variables can have an impact on private investment. The study uses GLS regression and 33 Asian developing economies were studied for the period between 2001 and 2019. This group of nations has several economic development features as well as certain demographic and social traits.

Regression results in table 2 and 3 reveal that trade openness has a positive influence on private investment. Since capital is circulated, private investment is recruited when trade openness increases, and sustainable development goals are achieved through boosting import and export activity (Frimpong & Marbuah, 2010). The study of private sector investment is practical because long-term growth will be dependent on a move to private investment associated with efficiency, change, and innovation. Furthermore, for the first time, the authors performed a regression for the interaction variables int1 (trade openness x high income countries), int2 (trade openness x political institution), and int3 (trade openness x post-crisis period) to show the linkage between trade openness in countries with high income, countries with constitutional political rule, and the trade openness of economies in the post-recession period. Investigating and identifying the variables influencing private sector investment also helps with the development of suitable policies for the government and stakeholders.

For other control variables, the article found the private sector credit, net foreign direct investment inflows, broad money supply, GDP growth rate, population, high income countries, the post-recession period, the constitutional rules and inflation had a positive influence on private sector investment. On the contrary, the result reveals foreign reserves have a negative impact on private investment.

Based on the research results, the authors conclude that trade openness has a positive impact on private investment in developing Asian countries. Additionally, through the analysis of interactive variables, the study also highlights the influence of trade openness in Asian developing countries under three specific situations, namely: (1) high-income developing countries where trade openness has a positive effect on private investment; (2) countries with constitutional political institutions and (3) the years following the 2008 recession, where trade openness has a negative impact on private investment.

Taking the above findings into consideration, several recommendations are suggested to exploit the positive impact of trade openness on private investment. These include diversifying export markets to facilitate trade openness, improving competitiveness for domestic enterprises, and regulating the expansion of money supply and capital markets in a manner that supports the strategic manufacturing industry. By implementing these measures, policymakers can create a more favorable environment for private sector investment and promote economic growth in developing Asian countries.

5.2. Policy recommendations

To make the most of the positive impact and minimize the threat of trade openness, the following policies focusing on expanding export markets and developing local manufacturing should be placed on top priority:

First, diversify export markets. Most of the developing countries in Asia have adopted an export-led strategy (Paul R. Krugman et al, 2018). However, according to data from the Export Potential Map of the International Trade Centre, both South Asia and Southeast Asia, where the majority of developing nations lie, still rely on the United States and China for export and import. Therefore, they should speed up the process of exploiting other potential markets that allow preferential conditions thanks to the Free Trade Agreements (FTAs) they involve, such as Australia, New Zealand, and other European countries. Besides, data from the Asia Regional Integration Center revealed that most of the developing countries in Asia only have 10-15 FTAs in force, except for those with high degree of globalization, such as India, Thailand. Therefore, nations need to make their best efforts to propose more FTAs and bring those under negotiation to a conclusion to create more market opportunities for their domestic business.

Second, improve the competitiveness of domestic manufacturing. The government needs to have relevant measures to protect and support their domestic industries in a way that could help firms generate competitive advantages (Krugman et al, 2018). Export subsidy, despite being a popular promotion measure in the past, has become an ineffective solution in recent years due to the increasing number of cases of countries using anti-dumping and anti-subsidy measures (according to data from UNCTAD). Therefore, authorities should adopt measures focusing on capital, technology, human resources, and innovation as these are the resources that most SMEs are lacking (Yoshino & Taghizadeh-Hesary, 2018). Firms, along with the efforts made by states, need to constantly develop competitiveness using preferential offers provided by authorities.

Third, regulate the capital market to support strategic industry. According to the results from the model, private sector credit and the money supply ratio have a significant impact on private investment. This is because the above two factors are an essential supply for individual investments. However, up to 60% of SMEs - an important factor of the Asian economy - cannot conduct transactions due to difficulties in accessing financial resources (Azreny & Akamatsu, 2014). Therefore, the states need to establish financial institutions in dynamic economic areas to efficiently regulate capital from developed industries (such as agriculture) into strategic developing industries (such as manufacturing). These establishments should diversify their financial services and offer interest incentives to mobilize idle capital. Along with that, firms need to abide by regulations and provide transparent and trustworthy information when calling for capital.

“BEHIND-THE-BORDERS” DETERMINANTS OF VIETNAM RICE EXPORT

Author: Nguyen Thu Thuan An¹, Nguyen Bao Ngan², Đào Thao Linh², Đào Mai Phuong², Ha Vy²

Mentor: Dinh Thi Thanh Binh

ABSTRACT: As one of the biggest rice exporters in the world, Vietnam's quantity of this agricultural product is usually influenced by a plethora of factorial elements. However, not all of those factors exert a strong effect on the exporting quantity as previous researchers suggested. The study is conducted to examine the performance of rice export in Vietnam as well as to identify how each determinant affects the rice export quantity of Vietnam to different countries. The researchers focus on 31 exporting partners in the 4 years period from 2018-2021. The results show that: While the GDP and geographical distance index of exporting countries have a negative correlation on Vietnam's rice export, the population factor has a positive correlation. In addition, there is no evidence of top export and inflation of importing countries having any influence. Although previous research has pointed out the statistically significant effect of all “behind-the-borders” factors on Vietnam rice export mentioned in the research, due to the limitation of data availability, the individual effect of each determinant has not been identified yet.

Keywords: rice export; Vietnam; “behind-the-borders” factors.

1. INTRODUCTION

Vietnam is known as one of the biggest rice exporters in the world. According to CRI's analysis, rice exports from Vietnam hit USD 3.133 billion in 2021, available in more than 150 countries and territories on all continents and it has played a crucial role in ensuring global food security. Since exporting rice is important for Vietnam's economy, research on the factors of countries importing rice from Vietnam will be very necessary so that we can identify potential market to boost rice export. Moreover, with the factors being known, policymakers and stakeholders in the Vietnam rice industry could make effective strategies to increase the output of rice export to the world and strengthen Vietnam's position in the industry.

There are many factors that influence rice export quantity in general and has been a widely discussed topic among researchers. In the past, various methods have been used to evaluate and they all come up with different results due to different approaches and the time carrying out the research. Researchers have majorly targeted their view to domestic force such as: rice quality, tax rate, rain level, etc. while the external factors from our partners are somehow overlooked.

Moreover, the current data has supported a rising trend in global demand for rice reserves, particularly for rice from key exporters including the Philippines, Malaysia, China,.... For example, during the Covid-19 pandemic in 2020, rice export reached 6.25 million tons, worth 3.12 billion USD (by Vietnam Import - Export report). Although the amount of rice exported decreased by about 1.9% compared to 2019 mainly for the sake of ensuring national food security, the export value increased by 11.2%. Due to the complex circumstances surrounding the Covid-19 outbreak and its rapid global growth, which causes a rise in the demand for food in many nations, Vietnam's rice exports are benefiting from several double chances. Therefore, it is crucial to conduct a serious study that helps Vietnam increase the amount of rice export, thus supporting the Vietnam economy, increasing the GDP and improving the quality of Vietnamese brands.

² Foreign Trade University.

In summary, the purpose of our research is to provide an analysis of 5 “behind-the-border” determinants affecting Vietnam’s rice export value to 31 countries from 2018 to 2021: countries’ GDP, inflation rate, top 15 exporters, population, and geographical distance by using the gravity model. Finally, we will reach a conclusion and have some recommendations based on the result of the report.

2. LITERATURE REVIEW

Economists had affirmed that the development of a country can begin only when the agricultural sector has been able to create surpluses and keeps expanding while the industry sector is developing (Meijerink and Roza, 2007). In Vietnam, rice export played a crucial role in the development of the agriculture sector in particular and the national economy in general, however, predicting the right factors which influence this activity was challenging. Several factors were considered key to promoting or weakening rice’s exportation, such as population size, GDP, inflation and exchange rate, international organizations participants,...and several types of research were also conducted to confirm this forecast.

Research from Ms. Thi Hong Hanh Bui and Mr. Qiting Chen (2015) aimed to describe the processes involved in factors influencing rice export in Vietnam. Regardless of the high quantity, our export value is not high and increases slowly, which directly affects the benefits and incomes of the rice farmers. Although Vietnam became the second-largest rice-exporting nation in the world after India (2012), they found that Vietnamese rice export was still significantly influenced by the change in the gross domestic product (GDP), price, population, and exchange rate of import countries by using the gravity model with research time from 2004 to 2013.

In order to enhance Vietnam’s agriculture export in general, Mr. Dao Dinh Nguyen (2020) applied the stochastic frontier gravity model to estimate the factors affecting Vietnam’s export of rice, one of two most important agricultural products in Vietnam, especially in exploring the role of “behind-the-border” constraints of rice. This study found that the impact of “behind-the-border” constraints was statistically significant, suggesting that Vietnam’s exports of rice may be prevented from reaching their export potential by such factors. The Association of Southeast Asian Nations group (ASEAN) continued to be the major market of Vietnamese rice. Vietnam can also take advantage of the opportunity to export these commodities to the European Union (EU) (not including the UK) and the Comprehensive and Progressive Agreement for Trans-Pacific Partnership. However, there were still significant limitations existing in this research, which is it cannot identify specific “behind-the-border” factors due to the limitation of data availability. In order to accomplish this research as well as confirm the impact of factors on Vietnam’s exports of rice, our paper will dig deeper into this limitation and provide some recommendations at the end.

Besides Dao Dinh Nguyen’s, a research conducted by Nguyen Thi Le Giang, Vu Duy Long, Cam Thuy Hang, and Le Ngoc Tram (2020) named “An analysis of factors influencing Vietnam’s rice export to the ASEAN +3 country” also examined similar determinants: GDP and rice growing area of Vietnam, GDP, and population of trading partners, geographical distance between 2 nations, the exchange rate between 2 nations and the dummy variable - WTO. This study found that the GDP of Vietnam, harvesting area, geographical distance, and population of importing nations had positive coefficients. Meanwhile, the GDP of importing countries, exchange rate, and WTO showcased strongly inverse effects on the total value of rice export.

Another group of authors Vo Thanh Danh, Truong Dong Loc, and Nguyen Tuan Kiet (2017) conducted research about factors that affect Vietnam’s rice export in the ASEAN market from 2000 to 2015 by using the Gravity Model (GM). This research found that, during the period, there were 4 factors that impacted

positively on total export revenue of Vietnamese rice such as: GDP of Vietnam, the geographical distance between import and export nations, Vietnam’s inflation rate, and the rice harvesting area of Vietnam. On the other hand, the total export volume was negatively influenced by the Economic Distance.

To conclude, the impact of GDP of importing countries, geographical distance, inflation, and population factors on Vietnam rice export should be taken into further research as these previous studies recommended.

3. DATA AND METHODOLOGY

3.1. Data description

The data was collected for the period from 2018-2021 for 31 rice-exporting partners of Vietnam based on their GDP, inflation, population, geographical distance from observed country to Vietnam, Vietnam’s export turnover to the country and whether observed country was in the list of top 15 global rice exporters or not. The countries represented in the dataset were originated in the report of Vietnam Institute of Strategy and Policy for Industry and Trade (Ministry of Industry and Trade). Some changes in rice export to observed countries are included in Figure 3.1.

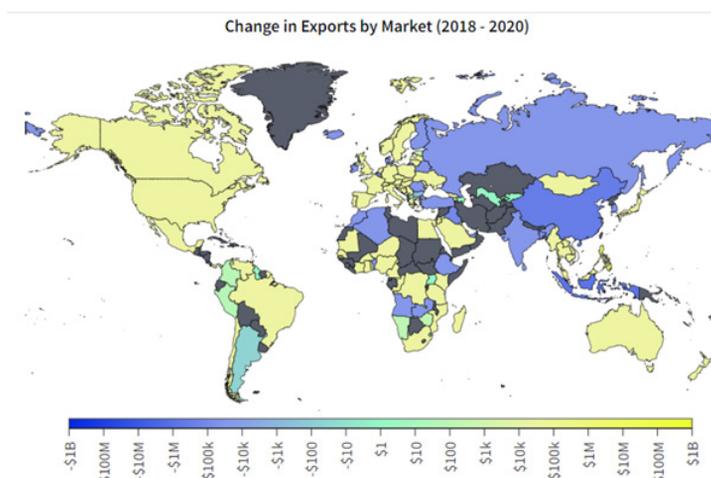

Figure 3.1 - Changes in rice exports by market (2018-2020)

The GDP and inflation figures were taken from the World Bank Data. The list of top 15 rice exporters originated from World’s Top Exports. The geographical distance was from Distancefromto.Net and Vietnam rice export turnover was cited in the report of Trade Map and Vietnam Institute of Strategy and Policy for Industry and Trade (Ministry of Industry and Trade). Table 3.1 below described each of the variables, their units, and their predicted effect on Vietnam’s quantity of rice export.

Variable name	Description	Predicted effect
Inexport	Natural logarithm of the amount of Vietnam’s rice export to observed country	Dependent variable
InGDP	Natural logarithm of GDP of observed country	+/-
Ingdis	Natural logarithm of geographical distance from Vietnam to the observed country	-
inflation	Inflation rate of the observed country	+/-
topexp	Whether the observed country is in the top 15 of global rice exporters or not: topexp = 0 if the country if not in top 15 topexpt = 1 if the country is in top 15	-
Inpop	Natural logarithm of population of the observed country	+/-

Table 3.1 - Name, description unit and predicted effect of included variables

The particular impact of each factor in rice export quantity from Vietnam to the observed country will be presented below.

GDP: When the gross domestic product (GDP) of importers increases, the demand for goods and services increases, which brings more export opportunities for Vietnam. The specific influence is different for individual economies. For countries consuming rice as normal goods, the increase in GDP will make the demand for rice growing. For countries that consider rice an inferior good, the fluctuation of GDP may affect rice import value in the opposite direction.

Geographical distance: The distance between countries apparently affects transportation costs and shipping risk. The closer the distance is, the higher the possibility rice will be exported from Vietnam to the observed country.

Inflation: An appropriate rate of inflation (at around 2%) is acceptable for the growth of the economy. However, when the inflation rate sharply accelerates and stays high, the purchasing power of money will be significantly affected; thus, it can decrease the quantity demanded of goods.

Top export: When a country was listed in the top 15 global rice exporters, it illustrated that the country can produce enough capacity for domestic consumption and the recessive amount will be used for exporting purposes. However, the data showed that some countries in the list were crucial partners of Vietnam in the rice exporting sector, which raises the question of the specific effect of this factor on the amount of rice imported from Vietnam by those countries.

Population: The population of importers affects the workforce, production capacity and the demand for goods; which, in turns, affect imports. Large population generated a huge work force and high production capacity that will theoretically reduce the demand for importing goods. On the other hand, a crowded population results in higher demand for goods, especially food products. Like the above analysis, population variables can cause various impacts on the export of goods, and in this case, rice.

3.2. Methodology

Our econometric model is set up based on the gravity model. There will be some existence of autonomous error term sort of due to the exclusion of some variables in this model. We use the model form as follow:

$$\ln \text{export} = \beta_0 + \beta_1 \cdot \ln \text{GDP} + \beta_2 \cdot \ln \text{gdis} + \beta_3 \cdot \text{inflation} + \beta_4 \cdot \text{topexp} + \beta_5 \cdot \ln \text{pop} + \mu^{\wedge}$$

4. RESULTS AND INTERPRETATION

4.1. Correlation between independent variables and dependent variable

The correlation results for 5 independent variables are represented in Table 4.1. The sample size of the test was 121 although we collected 124 data in total. This was due to the fact that 3 data of export quantity were equal to 0, which made the export function become nonsense.

All of the five independent variables chosen in this experiment ($\ln \text{GDP}$, $\ln \text{gdis}$, inflation, topexp and $\ln \text{pop}$) had correlation with the dependent variable. In detail, $\ln \text{GDP}$, $\ln \text{gdis}$, inflation and topexp showed a negative correlation with $\ln \text{export}$ (as their correlation coefficients were negative). In other words, Vietnam tends to export more rice to the trading partners which had lower GDP, shorter geographical distance, lower inflation and did not belong to the top 15 world exporters.

Meanwhile, $\ln \text{pop}$ was the only independent variable that was positively correlated with the dependent variable, which indicated that the nations with higher population tended to be the subject for Vietnam to export more rice.

4.2. Diagnose problems of the models

However, since the existence of variables’ problems can originate in the incorrectness of hypothesis conclusions, the dataset was tested to diagnose those problems. Here are the results after we tried to identify the compatibility with assumption from 5 to assumption 7.

4.2.1. $E(u|X) = 0$ (Assumption 5)

Assumption 5 is satisfied only when $E(u) = 0$. The violation of Assumption 5 originates from 2 reasons. Those are an exclusion of important variables in the model or misspecification of the functional form. The violation can lead to the biased estimation and inexact hypothesis test in the final.

To recognize the problem, Ramsey test was used and the result showed that our model had neither misspecification of functional form nor any exclusion of important variables as the Prob > F shown in Table 4.2 is larger than $\alpha = 5\%$.

4.2.2. Multicollinearity

Multicollinearity occurs when independent variables have strong relationships with each other. We used the VIF test to check whether this case existed here or not. The result was 1.45, which was smaller than 10; therefore, the model did not have any multicollinearity (showcased in Table 4.3).

lngdis	1.14	0.878262
inflation	1.12	0.895911
Mean VIF	1.45	

Table 4.3 - VIF test result

4.2.3. Heteroskedasticity (Assumption 6)

Heteroskedasticity is caused by a violation of Assumption 6, in which estimators are not the best, still linear and unbiased. This leads to the biases of the coefficient's variance and an inexact hypothesis test. White test and Breusch - Pagan test's results indicated that the model was homoskedasticity (since the chi-results were higher than $\alpha = 5\%$). The results were represented in Table 4.4 and Table 4.5.

```

      Prob > chi2 =    0.0853
```

Table 4.5 - Breusch - Pagan test's result of the dataset

4.2.4. Normality of u (Assumption 7)

It is necessary to check the normality distribution of residual u since the abnormality of u distribution can lead to an inexact hypothesis test. To verify that the u had a normal distribution, the Jacque - Bera test was conducted. If the p-value is smaller than 0.05 (the significance level in this model), u has no normal distribution. This is the case our model met when the p-value was only 0.0212, smaller than the significant level (Table 4.6). The only way to eliminate this problem is to increase the sample size.

4.3. Hypothesis postulated

After testing the statistical hypothesis using the final model and the problems had been corrected, we checked the overall significance of the model. The F-test was used. When F(5, 115) and F_{α} were compared, it showcased that our model had an overall statistical significance.

In addition, as the R - squared indicator was 0.3171, this means that the independent variables included in the model can explain 31.71% of the variation of the lnexport. Thus, 68.29% of the variation of lnexport is explained by other variables that are not included in the model. By theory, they are included in u (so-called error term or residual).

With the significance level of 5%, only 3 independent variables are statistically significant with the dependent variable in the model, which included lnGDP, lngdis and lnpop (since their P - values were smaller than α).

Nevertheless, those 3 independent variables had different relationships with the dependent variable. To illustrate, data in Table 4.7 showed the factors that lnGDP and lngdis had negative coefficients. Due to the fact that the functional form used here is logarithm - logarithm form, the relationships between dependent variable and independent variable were indicated by percentage. In detail, when GDP of one observed country increased by 1%, Vietnamese rice export quantity to that nation tended to decrease by 0.534%. Likewise, the amount of rice export to one country tended to decline by 1.308% if its geographical distance was raised by 1%. In contrast, the third variable - lnpop - represented a positive correlation with lnexport, which meant that Vietnam tended to export an increased amount of 0.687% of rice to a country in case its population rose by 1%.

Table 4.7 - OLS results for the 2018 - 2021 period with dependent variable: lnexport

The report missed some key indicators of the total value of Vietnamese rice export compared to those studies that had been conducted previously. Price, tariff and non-tariff factors showed a negative effect on rice export (Cung et al.). Other papers also mentioned the exchange rate between Vietnam and trading partners as important indicators bearing a positive relationship with the export's value.

However, due to time constraints and inaccessibility of data, our model had not included all variables mentioned above. The inclusion of those variables can ameliorate the accuracy of the model, results and conclusion; thus, it allows us to propose better recommendations.

5. CONCLUSION & RECOMMENDATIONS

Our study uses Ordinary Least Squares regressions to investigate the “Behind-the-border” determinants that affect Vietnam’s rice export for the 2018-2021 period. With the data from 31 countries over 4 years, our study has found some significant results. There are 3 of 5 variables of our study that have an impact on Vietnam’s rice export. While the GDP and geographical distance index of exporting countries have a negative correlation on Vietnam’s rice export, the population factor has a positive correlation. In addition,

there is no evidence of top export and inflation of importing countries having any influence. These findings are consistent with previous research and study.

However, there are still some factors that could be possible determinants but are still not mentioned in the study such as the cultural difference, exchange rate, etc. This limitation is due to time constraints and the inaccessibility of data. In addition, the cross effects between factors have not been shown in this study, thus leaving a gap to be filled by future studies. Specific and related case studies from other exporting countries such as Thailand or India may help answer these puzzles, thus preventing data snooping or time period bias.

Besides, we would like to stress that with these statistically significant data, further research should take GDP, geographical distance and population of exporting countries into consideration carefully and thoroughly when looking for new potential markets for rice export as it could have an impact on Vietnam's economy. There are only 31 out of 193 countries importing rice from Vietnam, leaving us 162 markets to consider. These determinants proved from this research could help to narrow down to some potential market, which is low in GDP, high population, close geographical distance for the government & policymakers to contract a beneficial agreement. For example, those countries in Asia could be perfect markets to export rice as they are in the same continent with Vietnam, have lower GDP than those in Europe and America, and a high population. To be more specific, China and ASEAN countries are the most potential market based on the data of our study.

Therefore, we suggest that Vietnam should enter into trade agreements with countries which have a high potential for rice importation. The agreements could include tariff reductions, subsidies for rice production, etc. Thus, Vietnam can invest in improving its infrastructure to facilitate rice exportation to gain a more competitive edge and achieve efficiency in exporting rice. By implementing these policies, the country could increase its revenue and strengthen its economy. In summary, we believe that our study not only strengthen the conclusion of previous findings, but also provides valuable insights for policymakers and stakeholders in Vietnam rice industry to help them make informed decision and develop effective strategy to create a positive impact on Vietnam economy as a whole.

6. APPENDIX (DATA)

Year	No.	Name of Country	Total value of rice export (thousand usd)	GDP (million USD)	Geographical distance (km)	Inflation rate(%)	Top 15 rice exporters	Population (million people)

EVALUATION AND PROPOSITIONS FOR THE DEVELOPMENT OF EXPORT CREDIT INSURANCE IN VIETNAM

**Author: Truong Thi Ha Ninh¹, Pham Ngoc Khanh², Tran Duc Toan, Dang Quoc Thanh,
Du Thi Duyen, Dao Xuan Anh
Mentor: MSc Pham Thi Hien Minh**

ABSTRACT: The development of international trade and payment brings a lot of economic benefits to countries as well as import-export businesses. However, the risks of payment and debt collection become a challenge in international transactions. Currently, export credit insurance has been widely applied in many countries around the world to protect exporters against the above risks, but in Vietnam this type of insurance is still not popular. The article explains the reasons why export credit insurance is not popular in Vietnam, along with the opportunities and challenges of applying this insurance, analyzes the case study of 100 container Vietnamese cashews exported to Italy and proposes recommendations for the development of ECI.

Keyword: Export credit insurance (ECI), opportunities, challenges, case study, recommendations for development

1. INTRODUCTION

International trade activities originate from the need to exchange and trade goods across national borders. Nowadays, there are various forms of transactions such as exports, imports, temporary imports and re-exports, which have led to the development of systems and payment methods. However, this development has also led to an increase in various risks, particularly those related to payment, recovery, and mobilization of receivables from exports. Although there has been positive support from banks with high-security payment methods, safe credit methods such as letters of credit are not widely used to increase competitiveness and provide favorable conditions for importing partners. In Vietnam, a country famous for exporting agricultural products, payment methods predominantly used are documents against payment (D/P) and telegraphic transfer (T/T), which entail significant credit risks, such as importers' failure to pay.

Therefore, export credit insurance has emerged as a solution to support Vietnamese enterprises in limiting credit risks in commodity transactions as well as expanding international trading markets. It is recognized that export credit insurance is an effective shield that helps Vietnamese export enterprises to be confident in their international business and transactions. However, it has not received much attention from businesses. This article aims to identify the current situation of export credit insurance in Vietnam, investigate the reasons why export credit insurance has not been popular in Vietnam, as well as to gain a clear understanding of the role of this insurance form in the case study that may occur in 2022 for Vietnamese cashew export enterprises. Based on that, the article proposes some suggestions to develop this insurance in our country.

2. LITERATURE REVIEW

2.1. Research history in Vietnam

Awareness of the role of export credit insurance activities, many lecturers in the world choose this problem to study and research. But in Vietnam, there are a little research focused in the export credit insurance activities, as follow:

¹ Foreign Trade University; Email: k59.2011110181@ftu.edu.vn

² Foreign Trade University.

Pham Thi Nguyet (2009) “Export credit insurance - from experience of some countries in the world and lessons learned for Vietnam”, Master thesis PhD, National Economics University. In the study, the author analyzed in detail the points of trade insurance activities in some developed countries around the world through active participation of organizations such as Bern Association, International Trade Center ITC... The highlight of the topic is to provide a rigorous theoretical basis, from which to base the assessment prices in Chapter 2. However, the essay has not specifically analyzed the measurement indicators of this insurance but only made general comments and many paragraphs are not logical.

Nguyen Thi Mai (2017), “The role of export credit insurance in promoting export activities in Vietnam”, thesis of business administration in HUTECH University. This master’s thesis studies the current situation of the application of export credit insurance in promoting exports in Vietnam, through specific quantitative indicators such as size, quantity, growth rate and risk factors. The limitation of this study is that the research scope is wide, the data does not reflect the actual export situation as proposed by the topic.

Le Van Truong (2021) with the topic “Solutions to develop export credit insurance” export in Vietnam”, Master thesis in Banking Academy. The thesis was based on the theoretical basis of export credit and export credit insurance, thereby analyzing the situation in Vietnam in the period 2018-2020, a period when the global economy was affected by the Covid 19 pandemic.

Huy Tuong (2022) article with the topic “Export Credit Insurance: Finding a solution measures to protect exporting enterprises against credit risks”, published on Industry and Trade paper on 08/2022. The article analyzes potential credit risks in loan activities for import and export of enterprises, especially contents of assessment of import and export risks and payment risks arising during the time of the COVID-19 epidemic; at the same time introduce security solutions that trade credit insurance for import and export enterprises with the goal of minimizing risks, improve protection for businesses.

In summary, most of the studies have mentioned and addressed many related issues and created the foundation of research methods for the topic development export credit insurance activities and international experience and lessons for Vietnam but lack of updating the current situation of export credit insurance activities in Vietnam in the period of global influence and recovery after Covid 19.

2.2. Definition

In commercial activities in general, and in export activities (EA) of goods in particular, credit serves as a bridge between production, distribution, and consumption. Before the industrial revolution, exporters often directly extended credit (commercial credit) to importers in the form of deferred payment sales to promote the circulation of goods. However, exporters cannot have full knowledge of the buyers in other countries, which can lead to risks of non-repayment of money or exported goods. To protect exporters from such risks, export credit insurance (ECI) was formed.

ECI is a form of financial guarantee for exporters in export contracts with open credit payment conditions, when they face risks of bad debt, loss of payment ability of importers due to insolvency. (According to the Vietnam Development Bank - VDB)

ECI does not only apply to trade but also provides effective protection for domestic investors when investing in other countries or vice versa for foreign investors to attract capital to Vietnam. However, in reality, there are very few companies in the import-export sector in Vietnam that purchase ECI because it increases costs and involves high risks in their activities.

2.2. The content of export credit insurance (ECI):

The participants of ECI are export companies or banks providing export credit.

The object of ECI is the credit provided by exporting companies to buyers or export credit provided by banks.

The insured value of ECI is the value of the credit granted by exporting companies to buyers or the export credit provided by banks in the case where banks participate in insurance.

The insured amount is based on the insured value

The ratios reflecting the support of ECI are:

- The percentage of cover: This is a percentage of the total value of the export contract or the total value of the project that is covered by the insurance. This ratio is usually between 90% and 95% in ECI. Exporters also bear a small portion of the risk of their revenue.

- The premium rate: This is a fee paid per unit (usually \$100) of the total value of the export contract or the project that the insured person has to pay to the insurer, thus determining the insurance premium that the insured person has to pay according to an insurance contract.

- The support of ECI is demonstrated through these two ratios: high coverage ratio and low premium rate provided to domestic exporters, ensuring financial security for businesses against potential risks with a small premium. The coverage ratio for political risks is usually higher than that for commercial risks, aimed at providing exporters with assurance, especially when exporting to new markets or those with political instability such as war or unrest, thereby encouraging them to expand and explore new markets. The benefits for small businesses, or businesses exporting key or encouraged products etc. are mainly reflected in these two ratios.

The determining factors of insurance fees and insured risk rate: Typically, ECI providers offer an insured risk ratio that is lower than the entire risk, indicating that they do not provide full coverage for the risk. Exporters also bear a portion of the risk related to their receivables. The insured rate depends on several factors, including:

- Types of potential risks: The premium for political risks is usually higher, ranging from 90-95%, compared to commercial risks, which typically have an insured rate of 80-85%.

- Importing country: Generally, the insured rate will be higher if the importing country is a member of the Organization for Economic Cooperation and Development (OECD).

- The premium rate will be determined based on several fundamental factors such as:

+ The potential level of risk (including risks associated with the importing country)

+ Credit terms (payment conditions) of the export contract

+ The expiration of credit

+ The potential discount value of export bills and documents

+ Experience in export activities of the exporter

Based on these factors, export credit agencies may offer fixed fees or determine a specific fee for each case. Typically, this fee is much lower than the cost of using a letter of credit at banks.

2.3. Risks covered in export credit insurance

Trade risks are those related to Exporters or Payment Banks, including:

- Inability to repay debt due to bankruptcy, prolonged losses, or asset liquidation

- Exporter's inability to make payment at the end of the credit period or after a specified period when the credit period has been agreed to terminate

- Exporter's refusal to receive goods even though the goods are delivered in accordance with the terms of the contract

- Exporter's refusal to pay terms related to exports, such as handling costs, processing costs, etc.

Political risks are risks associated with economic, political, and social instability in the buyer's country that affect foreign trade activities, such as:

- Cancellation or non-renewal of export licenses

- War, rebellion, strikes, or other disruptions in the exporter's country

- Risks in transferring money from the exporter's country when the Importing Government implements measures to delay foreign debt payments because such payments would increase losses for this government

- Prohibition of exports in payment, meaning that the exporter's foreign deposit account is blocked

- Actions by foreign governments that in some way hinder the execution of contracts, such as export/import restrictions, confiscation or seizure of goods, nationalization, etc.

- Trade between private exporters and state-owned or state-run importers that do not fulfill commitments in payment obligations

In addition, other types of risks such as financial risks, production and transportation risks, and exchange rate risks should also be considered.

3. RESEARCH METHOD

We use qualitative desk-based methodology by collecting data via the secondary data such as WTO, Ministry of Industry and Trade of Vietnam, Ministry of Finance of Vietnam... After that, we analyze the pros and cons of ECI and illustrate a case-study in which ECI should have been used to protect Vietnamese exporters. Finally, we suggest some solutions to develop ECI in Vietnam.

4. CURRENT SITUATION OF EXPORT CREDIT INSURANCE IN VIETNAM

In December 2006, due to price volatility, the Vietnam Rubber Association launched the Export Credit Insurance Fund for the industry, for the first time introducing the concept of ECI in Vietnam. They aimed to mitigate the risks in rubber exports due to unstable prices, new markets, and in the process of producing export goods. Furthermore, the Fund supports its members with short-term and medium-term loans to bolster production, exports, and trade promotion activities. Despite having been proved to be effective, the model is for the exclusive use of association members in one specific industry and operating based solely on their urgent needs.

In 2007, Bao Minh Insurance Corporation implemented credit insurance in collaboration with Coface SA (France's ECI organization), one of the world's leading export credit agencies. Despite the support of Coface in terms of risk assessment and transfer of expertise, Bao Minh only received a few small orders. The possible explanation is that ECI had yet to be considered as an effective financial tool according to export companies.

More than a decade ago, ECI was relatively new to the insurance's market in Vietnam. Therefore, to bolster its development, the Government and relevant ministries and agencies issued a relatively suitable legal framework. On November 5th, 2010, Decision No. 2011/2010/QD-TTg was issued to implement the pilot project of ECI during the period of 2011-2013. All exporters were encouraged to participate in ECI for goods belonging to two groups:

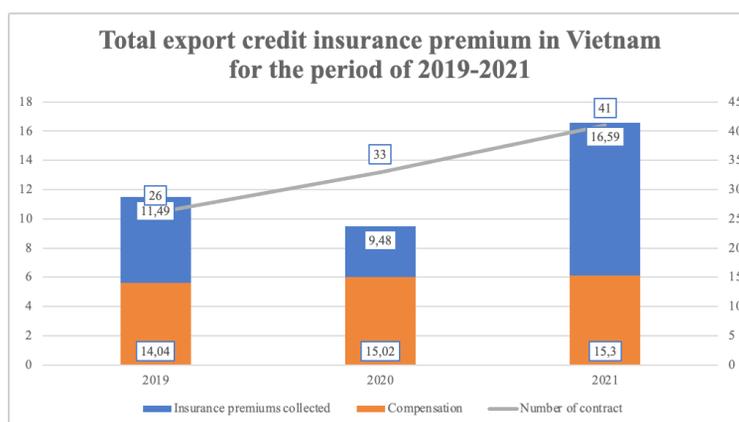

- Group 1: seafood, rice, coffee, fruits and vegetables, rubber, pepper, cashew nuts, tea, cassava and cassava-based products;

- Group 2: textiles, footwear, electronics and computer components, ceramics, glass, rattan and bamboo products, wooden products, plastic products, electrical wires and cables, bicycles and spare parts, handbags, hats, umbrellas, iron and steel products, machinery and equipment, and transport vehicles.

Subsequently, the Ministry of Finance issued several documents providing guidance for the initial implementation of ECI, including: Circular No. 99/2011/TT-BTC (July 07, 2011) directing the management of finances for the pilot implementation of ECI; Decision No. 2170/QD-BTC (September 9, 2011) declaring the list of insurance enterprises to participate in the ECI pilot program; and Decision No. 2766/QD-BTC (November 16, 2011) stipulating the general rules to govern ECI. The program provides support for traders engaged in ECI through a 20% reduction in the original premium of the ECI contract, while insurance enterprises are granted research and development costs for ECI Rules, expenses for organizing conferences and seminars to promote ECI, software installation costs for ECI database construction, ECI product design expenses, training costs, and propaganda expenses regarding ECI. The ECI pilot program has selected seven non-life insurers to participate: Bao Viet Insurance Corporation, Bao Minh Joint Stock Corporation, PVI Insurance Corporation, Bao Viet Tokio Marine Insurance Company, QBE Vietnam Insurance Company, Chartis Vietnam Insurance Company Limited, and Union Insurance Company.

With the tight coordination between relevant ministries and branches, the ECI pilot program has yielded certain outcomes after three years. Up to 2014, according to the Ministry of Industry and Trade, a total of 46 insurance policies were issued, including 23 ECI policies and 23 mixed insurance policies, which covered both export and domestic sales revenue (including some contracts that cannot be separated due to the essence of the business's total sales in the year). These policies insured a total export value of 12,592 billion VND, with a total collected insurance premium of 17.23 billion VND and total compensation of 13.33 billion VND.

In spite of some certain achievements during the pilot phase, the development has not lived up to expectations. Presently, the ECI has not flourished in Vietnam, as the number of businesses applying for the export insurance policy is not commensurate with the market size. According to Ministry of Finance, the number of licensed insurers and total insured exports for the period 2019 - 2021 are as follows:

Graph 1. Total export credit insurance premium in Vietnam for the period of 2019-2021

Unit: Billion VND

Source: tapchitaichinh.vn

It stands out that the insured export turnover has increased over the years, but only accounts for a very small proportion of the total export turnover of Vietnamese goods from 2019 to 2021.

5. ANALYSIS OF OPPORTUNITIES AND CHALLENGES OF EXPORT CREDIT INSURANCE AND ITS APPLICATION TO THE CASE OF 100 CONTAINERS OF CASHEW NUTS EXPORTED TO ITALY

5.1. Opportunities

Exporters face risks in using low-risk payment forms like L/C, D/A, D/P, or post-payment. To mitigate risks, exporters must adopt appropriate credit management programs, but the basic level of credit management in developing countries as Vietnam may not be sufficient. (Business Forum Magazine, 2022). Self-insurance faces limitations like capital stagnation and risk challenges. L/C payment methods can lead to low competitiveness and credibility, while ECI is an effective risk management tool for exporters to expand, safeguard receivables, minimize payments, and eliminate collateral requirements (Business Forum Magazine, 2022).

The cooperation of some insurance companies with foreign reinsurance partners also gives ECI a competitive advantage over other tools. Foreign reinsurance partners can provide their own professional collection services, which is crucial for exporters who may not be familiar with the practices, collection regulations, and legal regulations related to insolvency in the buyer's country, not to mention other barriers (language, geography) (Business Forum Magazine, 2022).

In addition, participation in new generation FTAs, such as Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP), also opens up many opportunities for Vietnam's export insurance market as follows:

- Increase in the demand for ECI of export enterprises: CPTPP and other FTAs help promote international trade activities. Under these agreements, exporters are provided with opportunities to expand their markets and increase exports, which has resulted in an increase in the number of exporters in Vietnam and consequently, a heightened demand for insurance products (WTO Center, 2018).

- Opportunity to diversify the market of export insurance products in Vietnam: Foreign investors together with domestic insurance companies help expand opportunities to diversify products, improve service quality, and bring more suitable insurance products to exporters (WTO Center, 2018).

- Opportunity to improve the quality of human resources: The insurance industry (including the BHX) will benefit significantly from the labor flow, helping to solve the challenged problem of high-level personnel, especially personnel for insurance actuaries, and specialists majoring in investment, law, and risk analysis (WTO Center, 2018).

- Improving the financial capacity of the insurance industry and enhancing the reputation of insurance enterprises: When implementing integration commitments, the Government's intervention in the business activities of insurance enterprises will decrease and limit protection. Vietnamese insurers have a chance to participate in a level playing field and a highly professional environment (WTO Center, 2018).

In the Insurance Market Outlook 2023 report, Deloitte experts pointed out three main trends which will impact the global insurance industry. One of the three is the trend of developing the technology ecosystem, which can bring great opportunities for the ECI market in Vietnam. The fact that insurers have strategies to develop insurance products catching up with the trend of information technology applications and the trend of green economy development will help create market confidence in the insurance channel. This is not only a key solution to help insurance companies maximize profits and scale but also attracts more customers to use this risk management tool (VnEconomy, 2023).

5.2. Challenges

Analysts say that in 2023, the picture of the global insurance market will be extremely gloomy due to macro risks and geopolitical conflicts. For Vietnam, when the economic openness is nearly twice that of GDP, Vietnam is not out of the trend of the global economy. These risks will permeate and strongly impact the business performance of domestic insurance companies (VnEconomy, 2023).

According to research by the International Association of Insurance Supervisors (IAIS) presented in the Global Insurance Market Report 2022 (GIMAR) and Outline of Key Results of Global Oversight (GME) last year in 2022, systemic risk in the insurance sector is generally moderate and low compared to the risk in the banking sector. However, the total systematic risk scores of global insurers are on an upward trend.

ECI differs from traditional commercial insurance in that it compensates for losses from business risks (such as foreign exchange risks, and insolvency) and political risks, not unexpected risks such as natural disasters, accidents... Thus, while commercial insurance depends greatly on risk management, ECI depends heavily on third parties, so traditional insurance businesses do not dare to take risks with this product (Ministry of Finance e-Gateway, 2010). In addition, domestic insurers do not have credit information systems in the country and abroad but have to depend almost entirely on international export credit institutions (ECAs) in the process of collecting and evaluating buyer information for risk assessment and insurance. Especially in the context of the Covid-19 pandemic in recent years, many export businesses are having difficulty recovering money from foreign partners, which can lead to increased credit risk for ECI companies.

In addition, there are some forms of safer export support or other forms available in accordance with international practices, combined with risk provisioning or government guarantee for some specific export goods under contracts signed between governments (such as rice exports). Besides, export traders have not yet had the habit of buying export-import insurance. They are instead very familiar with export support measures or other forms of payment such as letters of credit, and telegraphic transfer. Along with not being aware of the benefits of ECI, they believe that buying ECI will increase costs, leading to an increase in export products prices and a competitive advantage decrease. Exporters who are subjective in their ability to assess the reliability of their customers will create a psychology of not wanting to participate in an ECI (Ministry of Finance e-Gateway, 2010).

Besides, ECI is closely related to the bank. However, banks have not yet required export organizations to have ECI as an amount of loan security. The coordination and cohesion between banks and insurance enterprises in ECI have not been paid attention to (Ministry of Finance e-Gateway, 2010).

Regarding the governing law, currently, in Vietnam, there is no legal document that directly and specifically regulates ECI. Legal documents were issued to pilot ECI in the period 2011 - 2013 such as Decision No. 2011/2010/QĐ - TTg dated November 5, 2010, of the Prime Minister on the pilot implementation of ECI in the period 2011 - 2013; Circular No. 99/2011/TT – BTC dated 07/7/2011 of the Ministry of Finance guiding financial management for the pilot implementation of ECI; Decision No. 1626/QĐ – BTC dated 07/7/2011 of the Ministry of Finance on promulgating criteria for selecting insurance enterprises to pilot ECI; Decision No. 2170/QĐ – BTC dated September 9, 2011, of the Ministry of Finance on the announcement of the list of insurers selected for pilot implementation of ECI and Decision No. 2766/QĐ – BTC dated November 16/ 2011 of the Ministry of Finance on the promulgation of the ECI General Rules has now expired (Ministry of Finance e-Gateway, 2011).

5.3. Case study of 100 containers of cashew nuts exported to Italy

Summary

In March 2022, a number of businesses (with 5 large companies) exported cashew kernels to Italy through a brokerage company in Vietnam with an amount of nearly 100 containers worth hundreds of

millions of USD but did not receive payment and faced risk of goods' loss. These shipments which are transported by carriers: Cosco, Yangming, HMM, One, ...have been arriving at some Italian ports.

After sending the goods, Vietnamese cashew nut businesses send payment documents in the form of D/P to a Turkish bank according to the SWIFT code provided by the buyer but this code was changed after sending the goods. In particular, there are shipments that send a bill of lading by name according to the shipping line and in the payment records that do not include the bill of lading.

At the same time, the buyer is constantly asking for the courier's bill of lading code of the consignment document.

When the set of documents arrived at the Turkish bank, Vietnamese businesses received a notice:

- Buyer is not a customer of the bank; the bank will return the set of payment documents.
- There is no bill of lading in the dossiers; if so, they are just photocopies, even blank papers.

Suspected of being scammed to steal the original bill of lading, do not know where the original records of the shipments are while anyone with the original records can go to the carrier to receive the goods, Vietnamese businesses have contacted the association. The Vinacas Cashew Association is asked for help. As soon as detected signs of fraud, Vietnamese businesses coordinated with other units to promptly stop the delivery of **26 containers**.

Out of **74 containers** delivered on board:

- **39 containers**: The Vietnamese party promptly stopped a number of containers at the transit port in Singapore... for returning to Vietnam. Some containers were already on their way to Italy, when Vietnam asked the delivery unit to hand over the original documents that had not been delivered to the buyer's bank.

- **35 containers**: The original documents have been lost, the Vietnamese party has handled **30 containers** to bring back to Vietnam, sell to other customers in Italy or sell to a third country. With **5 containers** remaining at the Italian port, after a process of working with the Italian authorities, on May 27, the Larino Civil Court issued a ruling to return the ownership of **3 containers** within the contract. Proceedings of this court, on June 15 and 16, Napoli Economic - Financial Police and Genoa Port Military Police made a decision to return the last **2 containers** to Vietnamese enterprises.

- **RISKS**

- ***The risk of full loss***

When the incident happened, the biggest risk that the exporters had to bear was the loss of the entire shipment of 35 containers of cashews, as they had lost control over the shipment's documents. Vietnamese businesses were afraid that if the scammer presented the original documents, they would receive the goods from the shipping company. Especially when using a bill of lading as in this case, the risk was even greater. According to the provisions of the International Commercial Maritime Law, the shipping line will have to deliver the goods to the person presenting the bill of lading if they are the legal bill of the lading holder. At that time, Vietnamese businesses will lose their shipments. In case the seller (shipper) requests the shipping company not to deliver the goods but a third party presents a legal bill of lading, the claim of the shipment will have to wait for a court hearing. This causes time consuming and very high cost of hiring lawyers and adjudicating, which greatly affects Vietnamese businesses.

In the case of loss of goods, export cargo insurance may be mentioned, but based on this fact, no insurance company and type of insurance can accept compensation or settlement. loss because of the situation of 100 containers of cashews exported to Italy related to commercial fraud. Vietnam's exporters have completely trusted their brokers and did not clearly verify the cashew import partners, thus leading to the risk that Vietnamese enterprises face the risk of losing their shipments due to the stolen documents. hands of fraudsters and not due to objective reasons to be insured.

However, if exporters have registered for ECI, the case of 100 containers of cashew nuts will develop in a more positive direction. Specifically, before the enterprise signs an ECI contract with the insurance company, the enterprise is responsible for providing sufficient information about the importer, detailed information about the shipment and brokerage. At that time, the ECI company will have a task to appraise the import partner. This can only be done by trade credit insurance, while import and export cargo insurance will be responsible for verification mainly with shipping lines. In fact, the international network of the insurance company is certainly wider than the network of Vietnamese enterprises, so the verification and detection of commercial frauds will be more convenient than that of enterprises. , thereby minimizing risks and losses for the business.

- The risk of payment

Besides the risk of loss of goods, the team proposed to develop more cases of the case of 100 containers of cashew nuts to analyze the risks that Vietnamese businesses may face. Supposedly, after the insurance company verified the Italian cashew import partner and agreed to sign an ECI contract with a Vietnamese enterprise (the enterprise signed an insurance contract and a commercial contract before , then made delivery and payment). When signing contracts and making payments, currently, Vietnamese enterprises in order to increase their competitiveness, safe payment methods such as L/C letters of credit are often not popular because they are costly. Time for your country's partner business, but risky methods such as D/P, D/A, T/T are often preferred. Therefore, the risk of successful delivery to your country's port but not being paid or refused to receive the goods is very high.

The reason is explained by the effects of the economic downturn, according to research by Atradius - a company specializing in providing commercial credit insurance products, Swiss guarantees, bankruptcy rate, insolvency. Payment capacity is expected to increase in the years after the Covid pandemic because the Governments of some countries, especially countries in Europe, have completely eliminated financial support for businesses. Specifically, with Italian partners in the situation, bankruptcy and default of businesses, Italy is ranked first with a growth rate of 34%, the highest in the world. Therefore, when Italian businesses face financial problems due to the government cutting subsidies, they are unable to pay for the shipment or apply for payment later than the contract, then the business Vietnam faces the risk of not being paid, late payment will even have to sell the shipment to another partner or re-import it back to Vietnam. In this situation, ECI will maximize its effect when compensating Vietnamese businesses up to 90% of the value of the shipment. Then the insurance company will go to work with the Italian import partner, the risk has been transferred from the Vietnamese exporter to the insurance company.

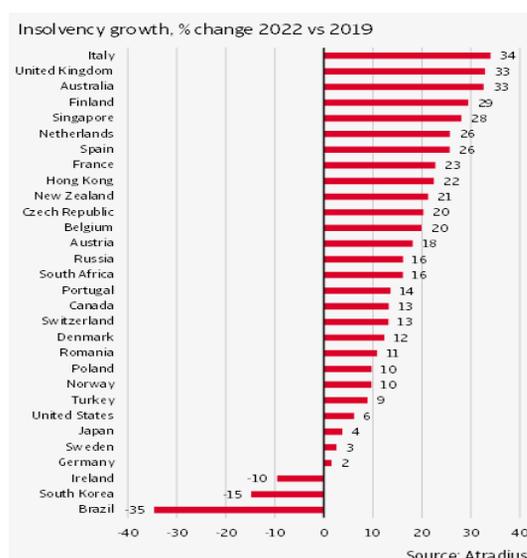

Figure 1. The growth of business insolvency in the world % change 2022 vs 2019

In particular, according to the situation of a shipment of 100 containers of seeds worth more than 20 million USD by the method of collection and delivery of documents (D/P), which has a relatively high risk because it does not require the buyer's deposition. Therefore, the buyer has the ability to use the original documents to receive the goods without paying any money to the seller, as happened with the Vietnam Cashew business. Buyer can refuse to accept the goods even though the goods are delivered in full compliance with the terms of the contract.

And according to the hypothetical situation, when the goods arrive at the enterprise due to unstable political, social and economic situations, the Italian importer goes bankrupt and is unable to pay for the shipment or ask for payment. slow, greatly affecting the business situation as well as the financial capacity of Vietnamese enterprises. And in this situation, when the Vietnamese cashew exporter signed short-term ECI contracts after sending goods with Bao Viet insurance company. Specifically, the period of credit granted to the buyer does not exceed 180 days from the date of issue of the bill of lading, which is the maximum accepted worldwide for all types of consumables. After 180 days from the date of issuing the bill of lading, the Italian enterprise is unable to pay and refuses to pay the shipment due to bankruptcy, then the Vietnamese enterprise will send a claim to Bao Viet. After verifying and determining that the risk is insured in the contract signed by the two parties, Bao Viet will compensate the Vietnamese enterprise from 90-95%, equivalent to more than 18 million USD for the contract. whole shipment of 100 containers of cashews. Therefore, Vietnamese enterprises will minimize financial losses and limit the risk of bankruptcy. Not to mention, the insurance company will also cover typical loss prevention and collection related costs such as telegraphic costs, moving, negotiating, negotiating to expedite the process. payment process, all these costs will be paid by the insurance company supporting the business.

6. RECOMMENDATIONS

6.1. Development orientation of export credit insurance in Vietnam

International experience shows that ECI is directly managed by a Government agency, in accordance with legal regulations on commercial insurance business, although operating according to market principles and the law of supply and demand. The development of import-export credit insurance has received the attention of the Government, insurance companies, and bancassurance companies in increasing supply scale, increasing competitiveness, diversifying insurance items on the basis of risk assessment and controlling, and ensuring the quality of credit insurance services for the import-export industry.

a. Growth in scale

Development of import and export credit insurance according to the content of scale development is mainly understood as concentrating resources to promote outstanding insurance for import and export loans at banks. In addition, the scale development also aims to attract more customers – mainly Vietnamese traders implementing export contracts and growing credit contracts. Finally, the development in scale is also reflected in the expansion of the area of operation; the increase in the number of transaction offices, which is towards the development of Vietnam's insurance industry, and access to large enterprises in the world.

b. Growth in market share

To show their position, insurance businesses often mainly implement strategies to increase their competitiveness compared to other companies in the same area. In addition, to develop market share, insurance companies also focus on creating increasing business efficiency to increase prestige and position, showing strong brands in the eyes of customers.

c. Product structure rationalization

First of all, in developing import-export credit insurance according to the content of rationalizing the product structure, it is necessary to pay attention to the level of changes in the structure of import-export credit insurance services and products. The goal of product structure rationalization is to offer flexible insurance terms, meet the needs of import-export enterprises, and ensure that customers feel the benefits when signing ECI contracts.

d. Income growth from the insurance business

Income growth is the growth in revenue from import and export credit insurance activities. The source of income of companies is reflected in interest income from lending activities, and collecting insurance premiums for reinvestment.

e. Risk management

The objective of strengthening risk control in the development of import and export credit insurance is to balance the benefits from the development of import and export credit insurance according to other contents with the risks that insurance companies can bear.

f. Service quality improvement

The orientation of import-export credit insurance development towards improving service quality is how to satisfy customer needs to the maximum, taking quality as the foundation for customer development. Regular evaluation of customer satisfaction is the foundation of the service quality improvement strategy because the purpose of improving service quality is to maximize customer needs.

6.2. Solutions to develop export credit insurance in Vietnam

Vietnam should promote the use of export-import insurance and strengthen the risk assessment capacity for export enterprises. Because global trade has an enormous transaction value, the capital, executive ability, and expertise requirements for credit insurance institutions are very high, along with the requirements for the process of assessment, analysis of insurance risks, risk management controls, claims handling, and debt collection are also wide-ranging.

Roles of Government agencies

State agencies are not directly involved in the company's business activities but only make important decisions to help insurance companies operate flexibly and adapt faster and more appropriately when the market fluctuates. This model has many outstanding advantages compared to the model that the State both owns and intervenes directly in the company's business. In detail:

- Improving the legal and business environment on WTO principles in parallel with researching and perfecting the model of the organization providing ECI.

- Completing the law on registration and governance of credit insurance enterprises in the import-export industry. Centralized supervision, monitoring, and management of law enforcement. For developing countries such as Vietnam, the operation of ECI providers in the early stages always faces obstacles.

- Creating a mechanism for full and transparent information on the business and financial situation of credit insurance enterprises in the import-export industry. When grasping the financial situation of the above-mentioned enterprises, the competent agency then makes timely assessments of enterprises and takes measures and policies to encourage or support them.

- Encouraging the establishment of companies specializing in providing ECI.

Regarding the ECI company establishment model, the specialization of core activities brings highly specialized products and services. Therefore, when the international market situation fluctuates, these companies can change their policies flexibly, suitable for the highest goal of maximum support for exporting

enterprises, without affecting the policies and operations of other types of insurance products such as banks or an existing insurance company. In addition, the company specializing in ECI will have favorable conditions to specialize in business activities in each stage and each cycle, thereby, gradually improving the professional level of human resources, as well as focusing on researching to find out the limitations to perfect products, and offering more suitable products to meet the increasingly diverse needs of exporters in the context of many fluctuations in the world economy.

- In order to encourage the participation in ECI, the Ministry of Finance may study and amend the mechanism and policy of provisions for bad receivable debts applied to enterprises by allowing enterprises participating in ECI not to have to deduct provisions for bad receivable debts.

- Establishing an export coordination center as a focal point to advise enterprises on information on export markets, and arranging credit insurance contracts for exporting enterprises (Ministry of Finance e-Gateway, 2013).

The provision of insurance services will be open to all insurance companies worldwide, without a monopoly mechanism. In fact, businesses can directly sign insurance contracts, but the scale will be very small and they have difficulty accessing large corporations. If through a focal point – buying common insurance for a large number of exporters for a fee of up to several tens or hundreds of millions of dollars with a large insurance corporation, the cost of insurance and the form of insurance are also different.

- Establishing its own bank to finance the export sector, applying ECI as a tool for breakthrough development of export markets, having plans to ensure credit and payment risks, and creating conditions for enterprises to access large import corporations through credit insurance contracts that most Vietnamese banks have not used.

- Encouraging domestic exporting enterprises, especially those with large export turnover, to participate in ECI as a measure to ensure safety in international trade. Thereby encouraging enterprises to promote export contracts, bringing Vietnamese brands to reach out to the world market.

Roles of export credit insurance enterprises

- Improving professional skills

Focusing on training human resources with executive ability and professional experience in the industry by training courses abroad, organizing seminars to exchange experiences and learning experiences of foreign countries or field surveys, using advanced technology to access business information systems, building transparent and reliable finance situation,...; improving the reliable audit service system, professional skills meeting international auditing standards to ensure the correct reflection of financial information about the enterprise; and cooperating with international ECI organizations to establish an appropriate credit insurance risk acceptance and transfer structure.

- Diversifying services provided to customers

In addition to providing ECI services, organizations providing ECI services should provide additional services such as updating business information according to industry groups of each country, country risk analysis, etc.

- Transparency, efficiency, and shortening the dispute settlement process

The process of dispute settlement and judgment enforcement should be speeded up, transparent, and avoid leaving a bad impression on large export enterprises.

- Insurers also need to focus on promoting import-export credit insurance marketing through strengthening customer conferences.

Specifically, it is possible to reduce insurance premiums and procedure fees to attract customers, because in Vietnam, apart from large companies, the rest are still mostly small and medium enterprises. For traditional customers, there should be surveys to assess the level of satisfaction of customers regularly.

For potential customers, organize customer meetings, invite customers to import and export activities in new fields, and the State's orientation fields to collect information to know the real needs of customers. In addition, it is necessary to promote the marketing of import and export credit insurance through mass media such as television, radio, newspapers, and information channels... related to import and export activities.

ASSESSING THE EVFTA'S IMPACTS ON EXPORTING WOOD AND WOOD PRODUCTS FROM VIETNAM TO THE EU AND SOME PROPOSALS: A SMART ANALYSIS APPLICATION

Nguyen Truong Giang¹, Truong Thi Ha Ninh², Nguyen Viet Tuan¹, Nguyen Duc Anh¹
Mentor: Pham Thi Hien Minh¹

ABSTRACT: After more than three years of negotiating, Vietnam and the European Union (EU) officially concluded the negotiation of the Vietnam - EU Free Trade Agreement (EVFTA) in December 2015. The analysis and assessment of the impact of the EVFTA on Vietnam's export and import industries with the EU are of great significance to Vietnam. However, obviously, when participating in a new generation trade agreements like EVFTA, wood and wood products will have to face more consciousness. The research emphasizes analyzing the impact of the European-Vietnam Free Trade Agreement (EVFTA) on exporting wood and wood products from Vietnam to Europe. EVFTA is supposed to have a positive influence on Vietnam with the advantages of exporting wood and wood products. With the qualitative methods of the SMART model and collected data about 4-digit HS codes of wood and wood products, the research suggests that there has been a significant increase in exporting these products from Vietnam to Europe in the context of EVFTA but it has not been optimistic and taken full advantages. Based on this result, we would like to propose some suggestions to improve it in the future.

Keywords: EU, EVFTA, exporting, Vietnam, wood and articles of wood.

1. INTRODUCTION

The EU-Vietnam Free Trade Agreement (EVFTA) officially came into force on 01/08/2020, creating opportunities and special advantages for Vietnamese goods, marking an important step forward in the comprehensive cooperative partnership between Vietnam and the European Union. It is an achievement based on the efforts of the political system during the decade since Vietnam and the EU started negotiating a free trade agreement (FTA).

According to economic professors, the activated EVFTA will contribute to the restructuring of import and export products, helping Vietnam to create a proactive position in markets and diversified supply chains, reduce risks of disruption in trade and supply chains due to changes in trade relationships, climate change, natural disasters, and epidemics, and ensure the sustainable development of the economy. After one year of implementing the EVFTA, two-way trade between Vietnam and the EU still reached more than 54 billion USD, an increase of 12%, and total exports reached more than 38 billion USD, an increase of 11% (General Department of Vietnam Customs, 2021). The Commission of European Communities (2018) forecasts that exports from Vietnam to the EU will increase by about 18%, equivalent to an increase of 15 billion EUR in 2035 under the impact of EVFTA.

In particular, the export of wood and products related to wood is considered to be an eligible field to benefit from great tariff incentives, especially Vietnamese wood and wood products with comparative advantages. For example, import duties on the remaining 17%, consisting of particle boards, fiber boards, plywood, and so forth, will be eliminated according to a schedule of 3-5 years, which opens up opportunities for Vietnam to enhance its competitiveness as well as promote exporting wood and wood products from Vietnam to the EU.

1 Foreign Trade University.

2 Foreign Trade University, Email: k59.2014110073@ftu.edu.vn.

In a comprehensive way, the EVFTA is a prerequisite for wood and wood products from Vietnam to effectively take advantage of the extremely large market through the EVFTA. According to the Vietnam Timber and Forest Products Association, since the EVFTA was signed in September 2019, the export value of wood and wood products to the markets of the EVFTA has increased by 17.1%, from 510.37 million USD in 2020 to 597.76 million USD in 2021. However, the achieved result is not commensurate with Vietnam's potential, has not fully benefited from the tariff preferences from EVFTA and Vietnam's comparative advantages.

Therefore, the analysis and assessment of the impact of the EVFTA on the export of wood and wood products from Vietnam to the EU is necessary for Vietnam to make specific adjustments and plans for the immediate priority goals as well as the long-term benefits, thereby improving the effectiveness of supporting Vietnamese enterprises in the future and promoting the export of wood and wood products from Vietnam to the EU in the context of EVFTA implementation.

2. LITERATURE REVIEW

Researching the impact of FTAs on member countries, Viner (1950) proposed two main trends impacting FTAs, namely the trade creation effect and the trade diversion effect. The trade creation effect occurs when the quantity of domestically produced goods decreases and is replaced by imports from the FTA partners, while increased consumption is supported by imported goods. The trade diversion effect occurs when imports from non-FTA members decrease and are replaced by imports from FTA member countries because of the tariff reduction, which causes the price of imported goods from these countries to be cheaper than those from other countries. If the positive effects of trade creation outweigh the negative effects of trade diversion, the FTA will improve national welfare.

When applying the theories of trade diversion and trade creation to analyze the impact of the FTA between the EU and South Africa, Johanna Assarson (2005) concluded: from 1999-2004, exports from South Africa to the EU increased by 75% and imports increased by 93%, which shows that the trade creation impact has already taken place and South Africa has benefited from the FTA established with the EU.

Paul Baker (2015) uses the overall equilibrium model and the local equilibrium model to analyze the expected impacts of the EVFTA, applying a standard sustainable impact assessment framework with a forecast period up to 2025. Thanks to capital inflows and improved labor productivity, Vietnam is forecast to grow significantly, with an estimated increase of 7-8% GDP in terms of economic growth by 2025.

Hadjinikolov et al. (2018) use a local equilibrium model to analyze the impact of the EVFTA on Bulgaria's exports to Vietnam. The results show that the EVFTA will create an opportunity to increase Bulgaria's exports to Vietnam, with the highest positive impact on products from the food, chemical, and textile industries. The limitation of this study is that when performing the simulation, it defaulted to the case of full liberalization even though tariffs still exist for some products.

Do Huyen Mai (2021) assessed the current export performance of Vietnam to the EU to realize the opportunities and challenges to the goods export performance of Vietnam in the context of implementing EVFTA. From that, the author suggested some solutions to promote exporting goods from Vietnam to the EU.

Pham Van Phuc Tan (2019) conducted a SMART simulation to study the impact of EVFTA on Vietnam's key commodities to the EU and showed that the trade creation effect outweighs the trade diversion effect, accounting for about 69% of the total impact of the EVFTA on Vietnam's seafood exports. Meanwhile, Trinh Thuy Ngan (2020) concluded that the EVFTA will create a positive impact, making the value of Vietnam's agricultural exports to the EU increase by more than \$37.352 million.

Huong Thanh Vu (2016) adopted the SMART approach to market analysis and restrictions on trade to assess the ex-ante influence of tariff elimination under EVFTA. The findings indicated that although Vietnam’s imports of medicines from the EU would not significantly increase as a result of the removal of tariffs, its imports from the EU would slightly decrease as a result of its deeper integration with ASEAN + 3 and TPP (the Trans-Pacific Partnership) nations. Moreover, the simulation findings also showed that the EVFTA would increase Vietnam’s welfare because its positive trade creation effect would outweigh its negative trade diversion effect.

To conclude, it can be said that the above studies have not fully and comprehensively studied the impact of the EVFTA on the export of wood and wood products from Vietnam to the EU. Therefore, this is a study that contributes to filling the above gap on the impacts of the EVFTA on the export of wood and wood products from Vietnam to the EU, then proposes some recommendations to promote exporting wood and wood products from Vietnam to the EU.

3. METHODOLOGY

To use and analyze the collected data, the authors used statistical comparisons, trade indicator analysis methods, and the SMART model and Revealed Comparative Advantage (RCA). Liesner (1985), based on the theory of comparative advantage, proposed the idea of evaluating the comparative advantage product of a country through the analysis of its exports. If $RCA > 1$, country i has a comparative advantage in product j . If $RCA < 1$, country i has no comparative advantage over product j . To specifically evaluate the level of comparative advantage, the RCA index is classified into 4 groups:

Table 1: Classify the level of comparative advantage through the RCA Index

No.	RCA value	Interpretation
1	$0 < RCA \leq 1$	No comparative advantage
2	$1 < RCA \leq 2$	Weak comparative advantage
3	$2 < RCA \leq 4$	Moderate comparative advantage
4	$RCA > 4$	Strong comparative advantage

Source: Hinloopen & Van Marrewijk (2001)

The RCA Index is calculated by this formula:

$$RCA_{ij} = \frac{\frac{x_{ij}}{x_{it}}}{\frac{x_{wj}}{x_{wt}}}$$

Where:

RCA is an indicator of the comparative index in the exports of product j of country i

x_{ij} : the export turnover of product j of country i

x_{it} : the total export turnover of country i

x_{wj} : the export turnover of products in the whole world

x_{wt} : the total export turnover in the whole world

SMART analysis method

The SMART model (Software for Market Analysis and Restrictions on Trade) is based on partial equilibrium theory and is accompanied by a simulation tool that is part of the database system for WITS Trade Software developed by the World Bank.

There are two approaches to assessing the impact of an FTA on a country's trade, including potential impact assessment (ex-ante) and real impact assessment (ex-post). Through background theory and empirical models, the EVFTA will take effect on August 1st, 2020, so it will be difficult to assess the real impact of the EVFTA when there is not enough necessary data. Therefore, choosing a model to assess the potential impact of EVFTA on Vietnam's export of wood and articles of wood to the EU market is the most appropriate method.

The advantage of the SMART model is that it is easy to access and implement with the WITS database and provides important quantitative results on trade impact, welfare, and tariff revenue for a fairly detailed industry and analysis at the most isolated trade data level. However, the SMART model has limitations, with the result that the model is limited to the direct effects of a change in the trade policy of a market because the model is based on the partial equilibrium theory. Therefore, the model ignores the indirect effects of trade policy changes in other markets (intersectoral effects) and feedback effects (effects resulting from a change in trade policy in a particular market spill over into the relevant markets and back to the market under consideration).

With the SMART model, to assess the impact of the proposed tariff reduction scenario under the EVFTA on Vietnam's trade in wood and wood products with the EU. The selected tariff reduction scenario is a 100% tax reduction. By using the SMART tool, the authors consider and assess the impact of tariff elimination on the export of wood and wood products from Vietnam to the EU. In this scenario, only the impacts on wood and wood products are analyzed and assessed, specifically the code of chapter 44 - HS 44 (including items from 4401 to 4421), and wood products is one number of articles of chapter 94 - HS 94 (including codes 9401, 9402 and 9403). The data to run the model is the 2022 data taken from the WITS system of the World Bank (World Bank, 2022).

The Revealed Competitive Advantage - RCA

RCA analysis helps identify the products and services in which a country has a comparative advantage. Countries can use this information to select the products they want to specialize in and allocate resources to areas where they have a competitive edge. The analysis can also help assess a country's trade competitiveness in global markets. If a country's RCA value is high in a particular product or service, it means that the country is competitive in that sector. This can help countries attract foreign direct investment and build a strong global reputation. By identifying the country's export strengths and weaknesses, RCA analysis can support export diversification efforts. Countries can use their competitive advantages to expand their exports into new markets, which can help reduce their reliance on a single product or market and increase their chances of sustained economic growth.

4. RESULTS

4.1. Revealed Competitive Advantage (RCA)

RCA of wood and wood products of Vietnam in the period of 2012-2022 compared to the world (4-digit HS codes) shown in table 2. In the period of 2012-2018, "tableware and kitchenware of wood" (HS 4419) had a strong comparative advantage with RCA from about 4 - 8. However, recently, it has only had a moderate comparative advantage with RCA of about 2 - 4. Besides, there are also some goods with a moderate comparative advantage, such as "wood marquetry and inlaid wood; caskets and cases for jewelry or cutlery, and similar articles, of wood; statuettes and other ornaments, of wood; wooden articles of furniture not falling in Chapter 94" (HS 4420), "Other articles of wood" (HS 4421), "Seats (other than those of heading 94.02) whether or not convertible into beds and parts thereof" (HS 9401) and "Other

furniture and parts thereof” (HS 9403). In fact, there are many goods with no comparative advantage because of $RCA < 1$ such as HS 4401, 4402, 4403, 4404, 4405, 4406, 4407, 4408, 4409, 4410, 4411, 4412, 4413, 4414, 4415, 4416, 4417, 4418 and 9402.

Table 2: RCA of wood and wood products from Vietnam compared to the world in the period of 2012-2022

Source: Calculated on Eurostat data

Generally, some 4-digit HS products have a decreasing RCA such as HS 4419, 4420, 9401, 9403. The causes are supply constraints, inflationary pressures, energy costs, logistics problems, especially technical standards, conformity, origin certificates of wood ... that the EU posed are still problems that are not easy to overcome. Moreover, the Covid-19 is also regarded as one of the most significant reasons leading to this decrease. Time constraints are especially a restriction for EVFTA to impact on the practice. However, exporting wood and wood products from Vietnam to the EU has been expected to be optimistic in the future.

4.2 Scenario and model estimation results

Within the scope of the article, the authors use the SMART model to assess the impact of the expected tariff reduction scenario under the EVFTA on Vietnam’s trade in wood and wood products with the EU. The selected tariff reduction scenario is a 100% tax reduction. Using the SMART tool, the authors considered assessing the impact of tariff elimination on the export of wood and wood products from Vietnam to the EU.

The tariff reduction scenario is evaluated on the model of Vietnam as an exporter, cutting tariffs on wood and articles of wood to the EU. In this model, the results will show changes in the export value of wood and articles of wood of Vietnam to the EU when tariffs are reduced.

4.2.1. General information

Export country: Vietnam

Import countries: EU

The year survey: 2021

4.2.2. Trade impact of wood and wood products (EU with Vietnam)**Table 3. Trade impact of wood and wood products (EU with Vietnam)***Unit: thousand of USD*

HS codes	Impact on the total trade	Trade creation	Trade diversion
4401	0	0	0
4402	0	0	0

9403	0	0	0
Total	10.537	6.059	4.478

Source: Synthesized from the results of the SMART-WITS model

Table 3 specifically explains the impact of the complete reduction of tariffs under the EVFTA on the export value of wood and articles of wood from Vietnam to the EU through trade creation and trade diversion effects. In particular, EVFTA has no impact on codes HS 4401, 4402, 4403, 4404, 4405, 4406, 4407, 4408, 4409, 4413, 4414, 4415, 4416, 4417, 4418, 4419, 4420, 4421, 9401, 9402, 9403.

In the remaining product groups, trade creation and trade diversion from the EU market to Vietnam have positive values. This shows that in the EU, there is a shift in importing wood and wood products from other countries to Vietnam. Accordingly, the impact on total trade is 10.537 thousand USD; trade creation is 6.059 thousand USD; and trade diversion is 4.478 thousand USD.

The data from the model show that the trade diversion effect is smaller than the trade creation effect. This shows that when the EVFTA came into effect, it did not have much impact on the wood and wood products of Vietnam.

4.2.3. Impact on the export turnover of wood and wood products in Vietnam

Table 4. Impact on the export turnover of wood and wood products in Vietnam

Unit: thousand of USD

Total	1,158,807.517	1,158,816.088	8.571	0.281%

Source: Synthesized from the results of the SMART-WITS model

Table 4 shows the change in exports of wood and wood products from Vietnam to the EU. It can be seen that the tariff reduction in the EVFTA does not bring export benefits for some products. The export product groups HS 4401, 4402, 4403, 4404, 4405, 4406, 4407, 4408, 4409, 4413, 4414, 4415, 4416, 4417, 4418, 4419, 4420, 4421, 9401, 9402, and 9403 have no change before and after tax reduction. In contrast, groups of HS 4410, 4411, and 4412 had a positive change.

5. CONCLUSION AND PROPOSALS

5.1. Conclusion

The results of the research show that the activated EVFTA brings many economic benefits to Vietnam by helping to increase the export turnover of wood and wood products from Vietnam to the EU. Based on the SMART model, the activated EVFTA increases 8.571 thousands of USD, and the trade creation impact outweighs the trade diversion effect when accounting for about 57.5% of the total trade impact, while trade diversion accounts for about 42.5% of the total trade impact. This shows that under the impact of EVFTA, Vietnamese goods become more competitive with those of rival countries when exporting similar products to the EU.

In terms of trade creation, wood and wood products from Vietnam that are exported to the EU when the EVFTA has not been affected have to suffer from a low tax rate of 3.5% - 6%. Therefore, within 7 years, when the EVFTA is activated, the tax rate reduced to 0% will not have a breakthrough impact on Vietnam's wood industry at the tariff level. In addition, most of Vietnam's wood products exported to the EU have enjoyed universal preferences (GSP) since before the EVFTA took effect. This leads to the fact that as soon as the EVFTA comes into effect, it will not affect many of the products in this group.

However, the advantages of tariff reduction due to EVFTA should be carefully considered when competitors are constantly promoting the process of launching, negotiating, and signing FTAs with the EU in order to reduce tax pressure on their exported goods. In addition, Vietnam cannot only rely on tariff preferences to fully take advantage of the positive impact of the EVFTA but also must pay attention to the issue of origin and sustainable development to be able to provide high requirements for goods exported to the EU in general and technical standards, conformity, and origin certificates of wood in particular.

5.2. Proposals

For the government

The government needs to strengthen the dissemination of information about the EVFTA for the business community and workers to have a better understanding of the commitments given by the EVFTA and, thereby, continue to innovate awareness in enforcing the EVFTA. Along with that, the government needs to analyze and evaluate the potential impacts of the EVFTA to find out which products are capable of taking advantage of opportunities and which can be challenged under the EVFTA. Based on that basis, a thorough analysis is needed to determine the costs and benefits of opening the market for these items and their associated solutions.

For wood and wood products, it is necessary to improve the competitiveness of exported wood and wood products by ensuring food safety and hygiene, origin, and technological innovation to increase product quality and diversify products, attracting more partners in the EU. Policies to improve the competitiveness of enterprises need to be focused on and supported appropriately, promptly, and quickly.

For enterprises

On the business side, it is necessary to show a more proactive spirit in learning about the EVFTA Agreement, because only when we understand these commitments clearly, we apply them effectively in real business. Enterprises need to strengthen cooperation, learn from each other, change management and business thinking by themselves, and cooperate to form production and business chains to be able to gather enough resources against competitive pressure.

Enterprises also need to pay close attention to commitments on sustainable development, such as principles and standards on labor and environmental protection, because these are issues that the EU is particularly interested in. Based on the tasks assigned by the government in the government's implementation plan of the EVFTA Agreement, ministries, ministerial-level agencies, provinces, and cities across the country will develop specific implementation plans for their own locations.

For industry associations

Industry associations, especially VIFOREST (Association of Vietnam Timber and Forest Product) need to serve as a connector between the agency that promulgates regulations on legal documents related to EVFTA, the EVFTA implementing agency at the ministerial, sectoral, and enterprise levels. With the role of a connector, industry associations need to update regulations and legal documents related to businesses as quickly as possible, guide implementation, and provide advice and support to solve difficulties for businesses.

Along with that, industry associations need to support businesses' access to the market. The association needs to review and provide information on the market through the network of industry associations in different countries and Vietnamese embassies in other countries. The process of reviewing and providing information will assist businesses in making appropriate decisions and orienting domestic enterprises to establish commercial relationships in line with targets, orientations, and management policies for exporting wood and wood products.

ASSESSMENT ON THE POTENTIAL IMPACTS (EX-ANTE) OF REGIONAL COMPREHENSIVE ECONOMIC PARTNERSHIP (RCEP) ON VIETNAM'S EXPORTS OF TEXTILES

Authors: Nguyen Ha Phuong¹, Nguyen Thu Phuong²

Mentors: Tran Thi Bich Nhung³, Nguyen Thi Phuong Linh²

ABSTRACT: Regional Comprehensive Economic Partnership Agreement (RCEP), is currently considered the largest Free Trade Agreement in the world. The Agreement has entered into force in Vietnam since January 1st, 2022 and is expected to optimize mutual benefits for all member countries. This paper attempts to assess the potential impacts (ex-ante) of the RCEP on the Vietnamese exportation of textile products to the RCEP market under the impact of the tariff reduction roadmap. Projected effects, including Trade Creation and Trade Diversion, are simulated by the WITS software developed by the World Bank. Contrary to positive scenarios expected, the simulation results show a 'dark picture' that when the tariff reduction is fully performed after around 20 years from 2022, Vietnam's textile exports to RCEP countries witness a loss of more than 839 million USD. It is solely Malaysia that Vietnam has gained the value of the Trade Creation Effect. Accordingly, research results also show that the trade diversion effect is expected to be greater than the trade creation effect. Based on results calculated by SMART, implications and recommendations are given. Due to practical constraints, this paper cannot provide a comprehensive review of wholly affected factors.

Keywords: Ex-ante; export; RCEP; textile; Vietnam.

1. INTRODUCTION

From January 1st, 2022, the Regional Comprehensive Economic Partnership (RCEP) has officially come into effect in Vietnam after nearly 08 years of negotiation and completion of documents. According to Vietnam Chamber of Commerce and Industry, up to 02 June 2023, the Agreement has officially entered into force for all members. As this agreement was signed, it would create a market of 2,2 billion people, equivalent to 26,2 trillion USD, accounting for nearly 30% of the global GDP, 29,5% of exports and 25,9% of worldwide imports of goods (According to the Ministry of Industry and Trade of the Socialist Republic of Vietnam, 2022), and it is also the largest free trade area in the world. RCEP is expected to bring many opportunities for the countries in the bloc in terms of economic development potential as the Agreement will eliminate at least 92% of import tax lines between the signatories within 20 years (According to The Ministry of Finance of Vietnam, 2022) and strengthen rules of origin in ASEAN+1 Free Trade Agreements e.g. ACFTA, AJCEP.

Telecommunications, information technology, textile, footwear and agricultural sectors are major beneficiaries of Vietnam's participation. For such a long time, textiles have been one of the key export commodities of Vietnam to the world. In 2021, Vietnam's textile ranked the third in the world exporting market with 5,7% market share (According to Vietnam National Textile and Garment Group). Up to now, Vietnamese textile products have been present in 66 countries and territories with 47-50 different products.

In view of export markets, besides the US, RCEP market is Vietnam's main one. The principle of origin accumulation in RCEP is a great opportunity for Vietnam in the production of processed goods for export. However, the implementation of RCEP comes with both great opportunities and challenges due

¹ Foreign Trade University, Email: nguyenhaphuong201115475@ftu.edu.vn

² Foreign Trade University.

³ Foreign Trade University, Email: tranhibichnhung.cs2@ftu.edu.vn

to its wide scope. Vietnamese products and goods, when exported to RCEP countries, would meet strict regulations and standards on traceability, origin, labeling, design specifications, etc.

With the above opportunities and challenges, the question arises as to how the export of textile products of Vietnam would change and adapt under the current situation. Stemming from this practice, authors carried out the research “*Assessment on the potential impacts (ex-ante) of Regional Comprehensive Economic Partnership (RCEP) on Vietnam’s exports of textiles*” to show the quantifiable impacts of RCEP on Vietnam’s textile exports to intra-regional countries.

This paper is composed of 05 chapters. The first section of this paper will examine the subject matter, the second is the theoretical framework as well as the research model suggested by the authors. The third chapter is concerned with the methodology used for this study, which is followed by result discussion and some recommendations for related organizations in two final parts.

2. THEORETICAL FRAMEWORK

The study applies the SMART model to quantify and forecast the impact of tariffs on Vietnam’s textile exports to RCEP countries when tariffs are reduced according to specific commitments. Up to June 2023, RCEP has fully entered into force in 15 countries, attracting much attention from governments, agencies and scholars. Scientific researches recently published focus on 05 key theories:

2.1. Overall assessment of the impact of RCEP in general

Alessandro Nicita (2021) in “*An Assessment of the Regional Comprehensive Economic Partnership (RCEP) - Tariff Concessions*” claims that most of the tariff preferences applied to trade involve major and key RCEP economies such as China, Korea, and Japan. According to this study, trade diversion prevails over the impact trade creation. To assess more specifically the impact of RCEP on a particular region such as ASEAN, Shandre Mugan Thangavelu, Shujiro Urata, and Dionisius A. Narjoko (2021) in “*Impacts of the Regional Comprehensive Economic Partnership on ASEAN and ASEAN Least Developed Countries in the Post-pandemic Recovery*” studied the possible effects of RCEP on ASEAN countries, especially the least developed ASEAN countries. Specifically, RCEP is an important stepping stone for countries to recover their economies after the pandemic, with the creation of a single framework of rules of origins for 15 member countries. Besides, Petri and Plummer (2020) in “*East Asia Decouples from the United States - Trade War, COVID-19, and East Asia’s New Trade Blocs*” focused on East Asia under the impacts of the trade war between the US and China, stated that East Asian countries are expected to benefit the most from RCEP. The above studies have shown a certain interest of international scholars in RCEP and related international events.

2.2. Assess the impact of RCEP on supply chain operations

Lingling Zhou et al (2021) in “*The Impact of RCEP on Chinese Regional Economy From Global Value Chains Perspective*” adopts the GTAP model to analyze and examine the impact of RCEP on China’s industry when participating in various global value chains. From an industrial perspective, the impact of RCEP on exports of different industrial products is different among them. However, the study covers the analysis of the impact of RCEP on overall manufacturing in China’s global supply chain. A serious weakness with this argument, however, is that researchers have not treated the impacts on particular countries in much detail.

2.3. Assessment of the potential impacts of RCEP on the economies of several member countries

A qualitative study by Damuri and Friawan (2023) titled “*RCEP and Indonesia - Economic Reform and Prospects for Implementation*” describes how RCEP had helped Indonesia improve relations with member countries as well as participate more deeply in the global supply chain and create a driving force for reform of the national economy. Similarly, Thangavelu et al (2022) in “Potential Impact of RCEP and Structural Transformation on Cambodia” highlights the importance of RCEP during the COVID-19 pandemic and post-pandemic recovery. Nguyen Khanh Linh et al (2022) in “*Study on the impact of the Regional Comprehensive Economic Partnership (RCEP) on Vietnam’s agricultural exports*” states that Vietnam mainly exports raw or minimally processed products, which seems difficult to compete with low prices in the region. Because the study uses a qualitative research method, the impacts of FTAs on trade have not been quantified.

Nguyen Thi Hoang Oanh (2017) in “*How Free Trade Agreements Affect Exports and Imports in Vietnam*” estimates 03 factors: bilateral trade relationship, market size and geographical distance. The key problem with this explanation is that this study applied the model mentioned by Tinbergen (1962). Some bilateral FTAs such as VJEP, VCFTA have positive impacts on Vietnam’s exports while some free trade agreements reduce exports such as AIFTA and ACFTA. However, this theory does not fully explain the quantitative impacts that illustrate the extent of the impact of FTAs on Vietnam’s import and export activities, as well as not going into each specific commodity.

2.4. Assessment using SMART model for analysis on potential impacts of RCEP

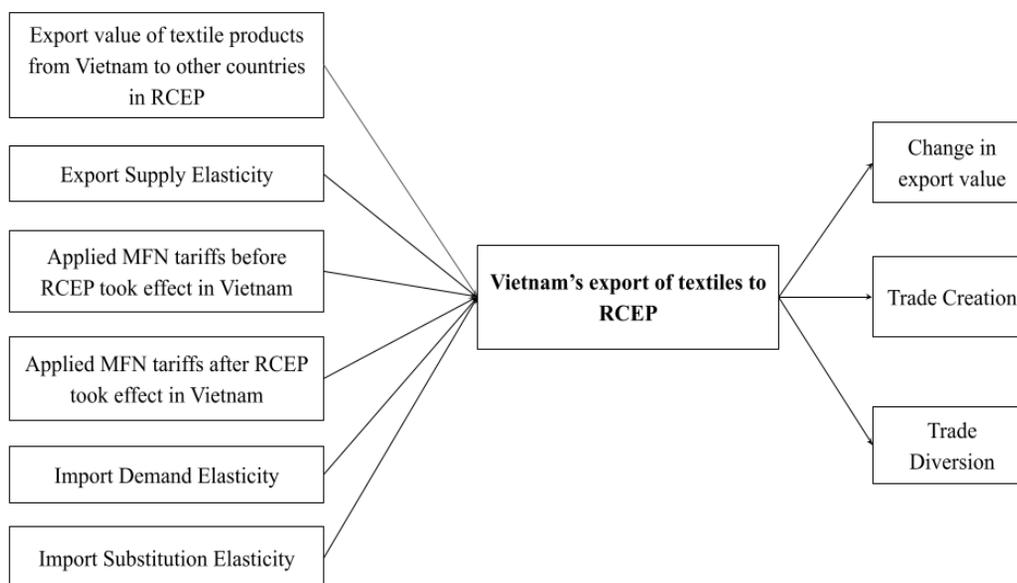

Rashmi Banga et al (2021) in “*RCEP - Goods Market Access Implications for ASEAN*” argues that tariff liberalization under RCEP will worsen existing BOT of ASEAN countries by 6% per year, while BOT will improve for some non-ASEAN countries in RCEP. ASEAN will gradually lose its export market share to non-ASEAN countries. Total export turnover of RCEP members will increase by 24.8 billion USD after RCEP comes into effect. However, the study covers an overview of the economy in general, not to certain industries.

To better understand the mechanisms of RCEP and its effects on textiles, Sheng Lu (2017) in “*Regional Comprehensive Economic Partnership (RCEP) - Impact on the Integration of Textile and Apparel Supply Chain in the Asia-Pacific Region*” points out that the overall textile industry and textile supply chain in Asia - Pacific under the impact of RCEP. Apparel exports from non-RCEP members to these markets will suffer decline and loss of market share due to stiff competition from RCEP members.

Do Minh Thu (2017) in “*Vietnamese agricultural products and opportunities from the Regional Comprehensive Economic Partnership (RCEP)*” using the SMART model quantifies potential changes in the value of agricultural products exported to RCEP countries. The study aims to project changes in the total export value of 04 key agricultural products of Vietnam. On that basis, the author gives some policy implications for agricultural product exporters as well as the Government on attracting investment, improving competitive advantages, linking product value chains, etc. to be able to seize the opportunities from RCEP effectively.

However, such studies remain narrow in focus dealing only with qualitative and quantitative methods used to analyze different types of commodity and various Free Trade Agreement. Based on these previous researches, authors suggest a research model with 06 inputs and 03 outputs as described in Figure 1 below.

Figure 1: Proposed research model

Source: Authors' compilation

3. RESEARCH METHOD

3.1. Qualitative research

The authors collect data related to the trade value of textile products whose code belong to two HS groups 61 and 62, the tariffs applied before and after RCEP taking effect, and trade indicator (RCA) and 03 types of elasticity used in SMART simulations from UN's COMTRADE, Trade Map, UNCTAD's TRAINS, WTO's IDB. Together these indicators provide important insights into the potential importers to which Vietnamese textile products are exported.

3.2. Quantitative research

By employing quantitative modes of enquiry, this research attempts to illuminate the potential of RCEP on Vietnam's exportation of textiles, using RCA trade indicator and results simulated by SMART model.

3.1.1. Trade Indicator - RCA

This qualitative research focuses on the indicators of import and export turnover of textile products of RCEP countries, the comparative advantage index of RCA. The research data in this paper is drawn from 05 main sources: The United Nations Statistical Database of Consumer Trade Data (UN COMTRADE), Trade Map, UNCTAD, WTO IDB, the Ministry of Finance and the Ministry of Industry and Trade of Vietnam.

3.1.2. SMART Model by WITS

The paper employs the SMART model with input data including the trade value of selected textile products (details up to 06 HS digits) and MFN tariff rate. Two product categories of chapters 61 and 62 of the Harmonized System (HS), detailed data level to 06 digits, divided into 34 groups of 04 digits (HS 6101 to HS 6117; HS 6201 to HS 6217).

Table 1: Summary of data sources in this research

Data	Source of data
Commercial value of textile products HS 61, 62 (detailed to 06-digit)	WITS - World Integrated Trade Solutions of UNCTAD (TRAINS) based on data from UN COMTRADE
	Trade Map
MFN tariffs	WITS - World Integrated Trade Solutions of UNCTAD (TRAINS) based on data from UN COMTRADE
	WTO's IDB
	Vietnam's Ministry of Finance

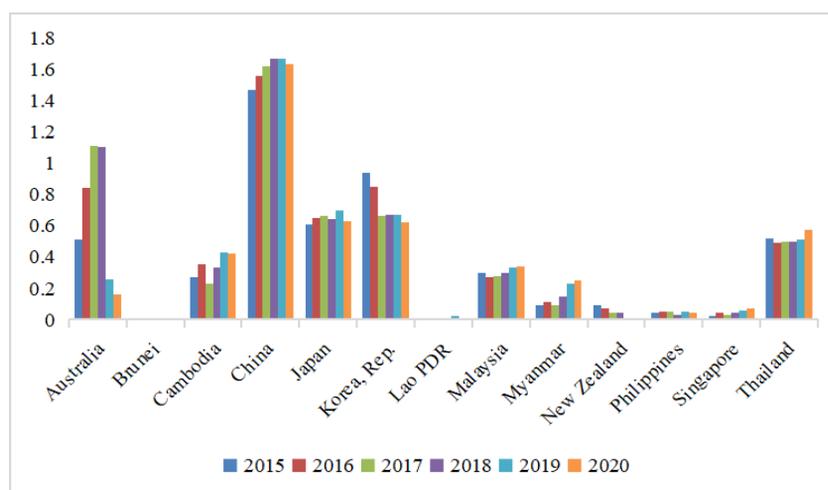

Source: Authors compiled from WITS

The collected data will be simulated by SMART software, after selecting the appropriate data and parameters, the software will process and output the results through 05 types of reports including: Detailed Data; Export View; Market View; Revenue Impact; Trade Creation Effect. Then these data would be used to analyze and explain the trade effect including trade creation and trade diversion.

4. RESULTS AND DISCUSSION

4.1. RCA Analysis

As was mentioned in the previous chapter, it is therefore likely that such connections exist between RCA and Vietnam's textile exportation in the period of 2015-2020.

Figure 2: RCA index of Vietnam's textile industry exports to RCEP from 2015 to 2020

Source: Authors compiled from WITS

From 2015 to 2020, China was the most outstanding trade partner of Vietnam. During the 05-year study period, China's RCA was always greater than 1 and always higher than the index in other countries within RCEP. Although Vietnam and China have not had any bilateral FTA, Vietnam has still achieved some economic and trade benefits over the years with ACFTA. In addition, other potential and promising trading partners such as Japan, Korea, and Thailand also show their relatively high RCA on the chart. Australia is a potential export country for Vietnam's textile products when RCA is quite high and greater than 1 in the period 2017-2018. However, in the period 2019-2020, RCA of all members decreased significantly compared to the previous period.

4.2. Trade creation impact & trade diversion

The total change in export turnover includes trade creation effect and trade diversion effect, so it is important to analyze these effects by using the SMART model to guide current and future trade policies.

Table 2: Change in Vietnam’s export turnover to RCEP market by typical HS

Unit: Thousand USD

HS Code	Export before RCEP entered into force	Export after RCEP entered into force	Proportion of export after RCEP entered into force	Change in export
6103	283.990,27	256.512,55	3,09%	-27.477,71
6104	542.922,00	479.433,85	5,77%	-63.488,15
6105	273.159,54	253.326,81	3,05%	-19.832,73
6109	1.023.894,92	940.791,30	11,33%	-83.103,62
6110	1.079.720,67	926.412,45	11,15%	-153.308,22
6114	190.363,77	182.988,71	2,20%	-7.375,05
61	4.327.296,01	3.879.997,08	46,71%	-447.298,93
6201	788.839,17	738.434,89	8,89%	-50.404,28
6202	565.998,48	532.046,84	6,41%	-33.951,64
6203	961.747,54	882.033,82	10,62%	-79.713,72
6204	670.819,51	588.773,21	7,09%	-82.046,30
6210	395.659,95	361.864,07	4,36%	-33.795,88
6211	632.561,23	572.383,75	6,89%	-60.177,47
62	4.818.196,56	4.426.090,44	53,29%	-392.106,11
Total	9.145.492,57	8.306.087,52	100,00%	-839.405,04

Source: Authors synthesized from SMART model results

In terms of overall impact, after the tax rate applied to Vietnam’s textile and apparel products was reduced to 0%, the export level of all HS 61 and 62 items decreased (in which, two groups of HS 6110 and 6109 had the widest change). In fact, two commodity groups 6109 and 6110 continue to be the main imported products of Vietnam into the RCEP market, accounting for 11.33% and 11.15% respectively. Compared to 2021 and earlier, we can see a change in the structure of the most imported products to RCEP countries. Considering the total of 02-digit HS codes, the proportion in exports is not too different between HS 61 and 62 before and after the Agreement comes into force, with HS 62 items are higher in share. By the end of the roadmap, the tax rate 0% is not only beneficial for Vietnam to enjoy this tax incentive but also for other member countries, especially Indonesia, Malaysia, China, or Cambodia - which compete strongly with us in the textile industry. Therefore, it can be seen that by the end of the roadmap (about 20 years), the export volume of two groups of goods HS 61 and 62 of Vietnam decreased and the loss fell to about 839 million USD. That said, although RCEP is expected to support and stimulate Vietnam’s textile exports, the simulation results show a decrease in total turnover.

Table 3: Trade creation and diversion effects by RCEP

Unit: Thousand USD

Countries	Trade creation effect	Proportion in the sum of trade creation effect	Trade diversion effect	Proportion in the sum of trade diversion effect	Total impact
Australia	0,00	0,00%	0,00	0,00%	0,00
Brunei	0,00	0,00%	0,00	0,00%	0,00
Cambodia	0,00	0,00%	-1.350,59	0,16%	-1.350,59

Countries	Trade creation effect	Proportion in the sum of trade creation effect	Trade diversion effect	Proportion in the sum of trade diversion effect	Total impact
China	0,00	0,00%	-13.766,02	1,64%	-13.766,02
Indonesia	0,00	0,00%	-2.378,57	0,28%	-2.378,57
Japan	0,00	0,00%	-612.388,87	72,95%	-612.388,87
Korea, Rep.	0,00	0,00%	-209.345,13	24,94%	-209.345,13
Lao PDR	0,00	0,00%	-1,82	0,00%	-1,82
Malaysia	5,76	100,00%	1,29	0,00%	7,05
Myanmar	0,00	0,00%	-12,85	0,00%	-12,85
New Zealand	0,00	0,00%	-4,78	0,00%	-4,78
Philippines	0,00	0,00%	-162,97	0,02%	-162,97
Singapore	0,00	0,00%	0,00	0,00%	0,00
Thailand	0,00	0,00%	-0,47	0,00%	-0,47
Total	5,76	100,00%	-839.410,78	100,00%	-839.405,02

Source: Authors synthesized from SMART model results

In terms of trade creation and diversion by country, we can see that the simulation results are not as expected. As follows:

Regarding trade creation effect, only Malaysia has a creation effect with Vietnam with the value created at 5,757 USD, accounting for 100% of the total value. By the end of the roadmap, ASEAN countries, including Vietnam, would mostly enjoy 0% tax incentives, which is an opportunity but also increases competitive pressure on prices of goods exported. Vietnamese products would compete with goods of both third member countries and domestic goods of these countries. Thanks to the positive development of the trade between Vietnam and Malaysia, the import and export turnover between the two countries has continuously increased over the years. Although currently Vietnam's main export products to the Malaysian market include machinery, equipment and spare parts; computer; electronics and components;... textile is one of the industry groups with the highest growth rate of export turnover in recent years.

For trade diversion, Australia, Brunei and Singapore have no diversion, only Malaysia has a positive value of 1,294 USD, and the remaining 10 countries all have negative diversion value - this means these countries would divert their importing from Vietnam to other nations. Japan is the country with the highest negative diversion value with more than 612 million USD, accounting for 72.95% of the total value created, followed by South Korea with more than 209 million USD and 24.94% of the total value.

The above data shows that there would be a big change from the time RCEP comes into force until the end of the tax-cutting roadmap. From 2021 onward, Japan, Korea and China have always been the top 3 countries in the total textile export turnover of Vietnam to the RCEP market. However, when the tax rate is reduced to 0% at the end of the route, these countries will redirect imports to other countries or import from their own partners in East Asia, making Vietnam's textile export South to these countries decrease and the deficit is higher than before.

Table 4: Trade Creation and Trade Diversion according to 04-digit HS

Unit: Thousand USD

HS Code	Trade creation effect	Proportion in the sum of trade creation effect	Trade diversion effect	Proportion in the sum of trade diversion effect	Total impact
6103	0,00	0,00%	-27.477,71	3,27%	-27.477,71
6104	0,00	0,00%	-63.488,15	7,56%	-63.488,15

Source: Authors synthesized from SMART model results

Considering two particular effects based on the product code structure, the research results show the difference and uneven distribution of values. The only three product codes with commercial value are 6117, 6211 and 6217, all concentrated in Malaysia. In view of the diversion effect, no HS code presents a positive total value of redirecting into Vietnam. 6110, 6109 and 6204 are the 3 codes with the highest and lowest change of 6215, respectively.

Table 5: Trade Creation and Trade Diversion of HS 6110 (06-digit HS)

Unit: Thousand USD

HS Code	Trade creation effect	Trade diversion effect	Total impact
611011	0,00	-11.914,57	-11.914,57
611012	0,00	-2.644,28	-2.644,28
611019	0,00	-166,98	-166,98
611020	0,00	-62.868,25	-62.868,25
611030	0,00	-75.114,79	-75.114,79
611090	0,00	-599,35	-599,35
Total	0,00	-153.308,22	-153.308,22

Source: Authors synthesized from SMART model results

Considering six 06-digit subgroups under HS 6110, 611020 and 611030 dominate most of the diversion impact. 6110 always occupies a high position among export textile codes, and the fact that the value of this code also occupies the highest position shows that the member countries' demand for this item is very large.

With the tax cut, partners that previously imported Vietnamese goods have now found a cheaper source to redirect, no longer importing from Vietnam as before.

As the only country that has both creating and diverting effects for Vietnam in apparel trade, Malaysia is expected to be the most potential country in the future among Vietnam's textile exporting markets.

Table 6: Trade Creation and Trade Diversion Effect of particular commodity group

Unit: Thousand USD

HS Code	Trade Creation Effect			Trade Diversion Effect		
	Trade creation effect	Proportion in the sum of trade creation effect	Proportion in the total impact	Trade diversion effect	Proportion in the sum of trade diversion effect	Proportion in the total impact
6117	5,175	89,89%	91,27%	0,495	38,25%	8,73%
6211	0,327	5,68%	45,35%	0,394	30,45%	54,65%
6217	0,255	4,43%	38,64%	0,405	31,30%	61,36%
Total	5,757	100,00%	-	1,294	100,00%	-

Source: Authors synthesized from SMART model results

In terms of the impact of Malaysia's creating and diverting by product codes, the results from SMART show that there are only 3 product codes that can show non-zero values, they are 6117, 6211 and 6217. For the creation effect, code 6117 dominates with 89.89% of the total value created. As for the diversion effect, all 3 codes have a relatively even distribution, with 6117 still accounting for the highest proportion (38.25%). Thus, when the tax rate is reduced to 0%, textile exports from Vietnam to the RCEP market would decrease. The creation impact is not significant, concentrated in a few industry groups and only one country, Malaysia. The effect of trade diversion is clearly shown, but it is in the outward diversion, meaning that countries would shift from Vietnam's imports to other countries.

4.3. Discussion

According to the results obtained from the SMART model, when RCEP countries remove tariff barriers as committed, textile exports from Vietnam to this huge market would decrease to more than 839 million USD. This decline is analyzed based on two effects: Trade creation and Trade diversion. To explain these negative effects, the study focuses on three main reasons:

Firstly, before RCEP officially took effect, Vietnam has participated in many FTAs with partners in RCEP, including regional ones such as ATIGA. Therefore, the tax rate for textiles has long enjoyed a relatively low tax rate, even at 0% when exporting to these countries. When RCEP comes into force, the difference between the tax rates before and after taking effect is not as significant, leading to the change in turnover not being too large, compared to other countries that had to be subject to high tariffs (due to few FTAs or no preferences).

Secondly, when tax rates are reduced to 0%, competition in price increases and requires countries to improve their competitiveness in export products. However, the advantage of cheap labor is no longer a bright spot of Vietnam compared to neighboring countries such as Laos and Cambodia.

Thirdly, auxiliary materials for textiles are also subject to preferential tariffs, not just finished goods. This means that raw materials for the manufacturing process would be cheaper than before, making domestic prices more competitive than foreign imports.

5. CONCLUSION AND RECOMMENDATIONS

The findings of this study have a number of important implications for future practice. With the use of the SMART model, the results of the evaluation of the potential impact (ex-ante) of RCEP Agreement on Vietnam's exports of textiles indicate that RCEP will have a negative impact. With the total export turnover forecasted to decrease by more than 839 million USD, it is not expected that the Agreement will bring great benefits to textile exports. The above results also show many similarities with the observations of previous studies. Specifically, Petri and Plummer (2020) and Sheng Lu (2017) illustrate that RCEP will better enhance the trade power of the group of 03 countries in East Asia (Japan, China, Korea). This also helps explain why India withdrew from RCEP at the end of the negotiation process. At the same time, Alessandro Nicita (2021) also confirmed that trade diversion will prevail over creation, and that the negative diversion sometimes overwhelms.

One source of weakness in this study which could have affected the measurements of RCEP's impacts is that data used in this research must be interpreted with caution because it is only a simulation not taking into account many other factors in the economy although there are some similarities compared with previous studies. Therefore, in order to make good use of the incentives that RCEP will probably bring in the early stages of its validity, Vietnam needs to pay attention to the rules, regulations and barriers when exporting to this market.

Recommendations for state authorities

One possible implication of this is that the government needs to develop a suitable roadmap to effectively implement the commitments in RCEP. The increasing protectionism of the domestic industry of the importing country creates many challenges for Vietnam's exports. The dissemination and mastery of regulations, requirements and technical standards are all extremely important. Therefore, experts who are directly involved in the negotiations, who are familiar with RCEP can launch appropriate publications and issues related to the Agreement. The government and import-export management agencies play an important role in exporting goods in general and exporting textiles in particular. Customs procedures need to be simplified, clear and transparent. In addition, policy makers need to consider an appropriate legal environment to attract and encourage enterprises to pursue an environmentally-friendly export strategy. It is necessary to have policies that encourage exporters to have annual environmental reports and activities.

Recommendations for enterprises manufacturing and exporting textiles

Vietnam's export turnover will decrease and trade will be diverted according to the CJK effect. RCEP marginally set out to leverage to facilitate trade for developed countries and can negatively affect developing countries (Rashmi Banga et al, 2021). Therefore, greater efforts are needed to ensure Vietnamese businesses prioritize learning about related corporations coming from those countries to identify competitors and offer effective solutions to help businesses for mutual benefits after RCEP enters into effect.

Another important practical implication is that enterprises should be well-prepared for the competitive process by enhancing production capacity and investing in Research and Development activities to participate more deeply in the global value chain and maintain a competitive advantage. Additionally, businesses need to regularly review and update to be able to understand all the problems or pressures from the market to adjust the business strategy towards an environmentally friendly export strategy. Enterprises should follow regulations, join associations to liaise with both domestic and foreign businesses, and reduce information gaps between the states and businesses.

Recommendations for intermediate support structures

Associations play an important role in investigating the signed trade agreements and related regulations to quickly inform businesses of necessary content, helping businesses orient production and export. On the contrary, If difficulties and problems arise, they need to be summarized and proposed by the corporations to relevant Departments and Ministries. There is, therefore, a definite need for enterprises to be helped to solve exact problems with timely support. Associations as well as Trade Promotion Centers need to strengthen the role of supporting enterprises in trade promotion, international cooperation, investment or and joint ventures to create opportunities and cooperation between businesses.

OUTWARD FOREIGN DIRECT INVESTMENT ACTIVITIES OF VIETNAMESE ENTERPRISES TO MEMBER COUNTRIES OF THE REGIONAL COMPREHENSIVE ECONOMIC PARTNERSHIP (RCEP)

Author: Huynh Nguyen Vinh¹

Mentor: Le Son Dai

Abstract: *The Regional Comprehensive Economic Partnership (RCEP) came into force in early 2022 has marked an important transition for Vietnamese investors to have the opportunity to integrate deeply into these potential markets. In that context, outward foreign direct investment (OFDI) is really an ideal direction, compatible with the actual conditions in Vietnam to exploit the incentives that this agreement brings. This article aims to understand the current situation and discover factors promoting or hindering OFDI investment process of Vietnamese enterprises into 14 member countries from 2010-2021 within the RCEP Agreement. Through the application of panel data in FGLS model (Feasible Generalized Least Square), the empirical results show the scale of inward foreign direct investment (IFDI) from RCEP member countries into Vietnam, economic openness, labor productivity, natural resources, infrastructure, return on sales ratio, political stability and non-violence have positive impacts on encouraging Vietnamese enterprises to make OFDI investment in these markets, while the price level ratio of PPP conversion factor (GDP) to market exchange rate hinders this activity.*

Keywords: *OFDI, RCEP, Vietnamese enterprises, RCEP member countries, FGLS model*

1. INTRODUCTION

Outward Foreign Direct Investment (OFDI) is an important economic activity, creating a driving force for the sustainable development of countries in the globalization trend and deep integration into the world economy (Xiaolan et al., 2018; Jianing, 2022). OFDI helps to free up the available resources of each country (Dong et al., 2021). Thereby, enterprises participate in restructuring the global production networks by expanding and exploiting the potentials in the host-country markets, creating spillover effects among countries in the region and internationally (Changjun et al., 2019; Zhuang et al., 2021). In addition to bring in foreign currency revenue and contributing to the prosperity of the home country, nations also use OFDI as an efficacious approach to influence the host country in solving problems of economic and political benefits in favor of the home country (Chen et al., 2022). Businesses throughout the world are well aware of the power that OFDI brings, therefore, current OFDI activities are not only conducted from one side by developed countries but also by developing countries. In fact, capital outflows from developing nations continuously increased rapidly, accounting for 43% of international investment capital (UNCTAD, 2021). Therefore, developing country governments lay great emphasis on engaging in the negotiation of bilateral and multilateral trade facilitation agreements in order to support all domestic economic sectors to have the opportunity to fully promote their capacity in international markets.

The Regional Comprehensive Economic Partnership (RCEP) was formed with the aim of strengthening ASEAN's cooperation with China, South Korea, Japan, Australia, and New Zealand on the basis of promoting trade and investment in the region in an comprehensive way, for mutual benefits. The RCEP has been negotiated since 2012 and officially entered into force on January 1st, 2022. With the participation of 15 member countries, RCEP is a region with gross domestic product (GDP) of USD 26.2 trillion, accounting for nearly 30% of global GDP with the largest population in the world, over 2.2 billion people, about 30% of the world's population (Center for WTO&IntlTrade-VCCI, 2021). This proves that RCEP promises to bring a number of positive prospects in

¹ Foreign Trade University Ho Chi Minh City Campus: huynhnguyenvinh1911115609@ftu.edu.vn

solving problems of employment, technology transfer, strengthening production systems, sharing and utilizing available resources, thereby improving the region's supply chain networks (Dordi et al., 2018).

Therefore, OFDI is not only a driving force for businesses to expand their markets and seek efficiency in production, but also enhancing a country's competitiveness and ability to integrate into the global economy. In that context, the negotiation of trade facilitation agreements is an inevitable trend when opening up the economy, OFDI is really a suitable direction for practical conditions in Vietnam to exploit the potentials and incentives that these agreements bring. With members being important strategic partners, RCEP is promising to create many attractive incentives, attracting Vietnamese investors to implement OFDI projects. The competitive advantage will belong to businesses that know how to quickly seize this opportunity to penetrate deeply into these markets. However, the fact that RCEP has just been put into effect from the beginning of 2022 may generate certain hesitations for Vietnamese enterprises when conducting OFDI projects.

2. THEORETICAL FRAMEWORK

On the basis of summarizing theories related to OFDI and the current situation of OFDI from Vietnamese enterprises to internationally and RCEP over the past time, I propose a model to study factors affecting OFDI activities from Vietnamese enterprises, including:(1)Driving factors from the home country (Push Factors); (2)Factors attracting from host country (Pull Factors);(3)OFDI decisions are evaluated by 4 motives: market-seeking, resource-seeking, efficiency-seeking and strategic asset-seeking.

2.1. Push factors from the home country

Research on the factors promoting OFDI activities from the investor's side is diverse. Notably, the report of UNCTAD (2006) is a complete study, pointed out the impact aspects of four key factors in promoting OFDI from a developing country to international market:(1) Domestic macroeconomic market;(2) Cost of domestic production;(3) Institutional factors from home country government. Accordingly:

(1) Domestic macroeconomic factors:

Enterprises tend to actively promote OFDI activities abroad to seek new investment locations when they are hindered by small market size, disproportionate to their production capacity as well as the growing presence of domestic competitors (Piperopoulos et al., 2018). Additionally, for developing countries, the constraints of domestic market size as well as limited business expansion opportunities will motivate domestic firms to invest abroad (UNCTAD, 2006).

Hence, the scale and level of domestic market competition are factors that promote enterprises to invest directly abroad. According to Cai et al.(2019), in an economy with slow growth rate, while enterprises are holding many ownership advantages (strategic assets, financial capacity, management skills, technological innovation), businesses are inevitably forced to find a new market to be able to fully promote the economic potential they are holding. This makes expanding scope of operations to other countries be a proper solution to maximize profits by diversifying customer files, and to share risks instead of just relying on domestic market.

(2) Domestic production costs:

The production costs that cause enterprises to promote OFDI activities are reflected in two main aspects: The limitation and scarcity of resources, and the escalation of production costs in domestic market (Trinh Quang Hung, 2021). For countries with limited input materials, businesses are forced to import to carry out next production stages. However, this will not be cost-effective in the long run. Therefore, enterprises choose OFDI to invest directly in that country with abundant natural resources and reduce transportation costs. Chinese firms tend to focus on OFDI in mineral-rich markets, while those in Europe actively expand their investments into emerging markets to cut labor costs (Levitin et al., 2016).

Additionally, production costs also take into account infrastructure factors (Bersant et al., 2017). When domestic transportation and telecommunications expenditures increase, businesses tend to shift OFDI flows

to lower-cost markets to fulfill basic requirements for business operations. Especially, operating in a market with modern facilities will support businesses to cut down on initial investment spending, helping the production process become smooth at a reasonable cost.

(3) Institutional factors from the home country government

Economic openness level of home country will affect directly to domestic economic sectors in conducting OFDI (Bhasin, 2021). Thanks to the supporting policy packages, which create favorable conditions in trade and promoting investment, the government has opened a wide door for businesses to easily enter the international market.

In addition, the socio-political situation in home country is also essential in promoting OFDI. According to Chen et al.(2022), enterprises operate in an environment with a clear and stable institutional regime and legal framework to help them understand the mechanisms for outward investment smoothly, avoiding problems arising during the operation process. That not only supports domestic enterprises to confidently promote OFDI but also creates trust and peace of mind from host country in welcoming foreign investors.

2.2. Pull factors from the host country

Besides these push factors from the home country, the influencing factors from host country also play a crucial and decisive role in choosing where to conduct OFDI projects. Accordingly:

(1) The host-country market:

Businesses in their efforts to find the destination of OFDI capital flows tend to choose which countries have attractive environmental conditions to invest in (UNCTAD, 2020;Chen et al., 2021). The market with a wide consumption scale, large purchasing power, along with rapid GDP growth will be ideal conditions and have a significant impact on the strategy of choosing the location and estimate the initial investment capital to conduct OFDI projects in that country (Xiaoqing et al., 2020).

Moreover, indicators of macro-stability in host country, including foreign exchange management policy, exchange rate, and inflation act as catalysts to attract investors (Hossain et al., 2021). Investors boldly invest in their country when the information is transparent, which can help businesses build a suitable roadmap with company's expansion strategy (Behera et al., 2020).

(2) Production in the host country:

(i) Costs

In the process of carrying out OFDI activities in foreign markets, enterprises may face the burden of paying expenses related to input production costs such as wages, transportation charges, telecommunications infrastructure, project maintenance costs (Liu et al., 2020). Moreover, when operating a business in another country, investors also have to bear additional disadvantages due to additional costs stemming from geographical distance between two countries, cultural differences, or requirements of the host government. Hence, the cost factor in organizing OFDI in another market is an important criterion that businesses must consider carefully before making a decision on choosing an OFDI location. Therefore, countries with abundant, highly skilled labor resources, or reasonable transaction costs will prevail in attracting foreign investors.

(ii) Labor force

Investing in human factors is a long-term strategic direction when implementing OFDI projects in foreign markets (Ramasamy and Yeung, 2022). Labor is the subject of the production process, which is an important resource determining the feasibility and success of projects. Additionally, in the face of the current innovation requirements, the application of newly-emerging technology in the production process is an inevitable trend, requiring highly skilled and specialized workers to operate automatic production lines. Therefore, exploiting this qualified human resource in developed countries is a suitable direction for Vietnamese SMEs to minimize training costs.

(iii) Natural resources

Investment activities are currently focusing on fields with high intellectual content, gradually reducing dependence on natural conditions due to the depletion of resource reserves (Xiaolan et al., 2018). However, for some specific fields such as agro-forestry-fishery, mining, oil and gas, natural resources of host country are still a prerequisite and decisive for investors in the strategy of expanding their operating areas. Therefore, a country possessing abundant natural resources will naturally have an advantage over the rest in the race to attract OFDI flows from other countries.

(iv) Infrastructure

Infrastructure acts as a catalyst to help investment activities take place smoothly and this is considered a basic component to attract investors from abroad. According to Kumari (2018), infrastructure is divided into two main groups: physical group and social group. The physical group includes transportation systems, internet networks, telecommunications, the availability of financial channels, distribution channel systems, energy sources. And the social group is included in responding to service requests for the community including health, education and recreation systems. The fact that OFDI host countries own a quality and modern infrastructure system will help businesses reduce initial investment activities, optimize costs as well as shorten OFDI project implementation time.

(3) Political stability and the absence of violence in host countries

Political institutional factor of host country has a strong and direct impact on the orientation of OFDI’s operation (Chen et al., 2022). OFDI activities require a long-term investment process and therefore selecting a country with stable political regimes, clear regulations will have strategic implications for businesses (Muhammad, 2019). Operating within a stable legal framework will ensure that investors enjoy commitments from the host state in matters of foreign nationalization or investment incentives. As a result, the investor’s mentality becomes secure as well as actively avoid risks during the OFDI projects implementation.

In conclusion, to assess the impact of each different factor, I summarize factors related to OFDI activities of Vietnamese enterprises within RCEP framework. The details are shown in Figure 1.

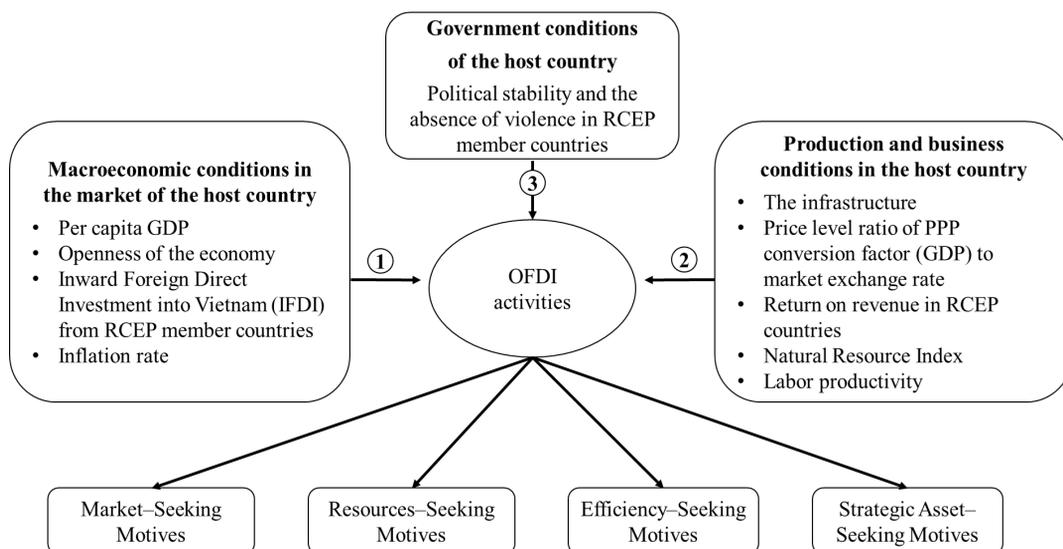

Figure 1. Theoretical model identifying factors affecting OFDI activities of Vietnamese enterprises to RCEP member countries

3. RESEARCH METHOD

- Descriptive statistics: On the basis of collected dataset, I interpret and consider the relationship and impact level of variables used in quantitative model.

- Quantitative research: Feasibility generalized least squares (FGLS) estimation is applied on the basis of overcoming defects and hypothesis violation of estimator models using panel data (Pooled OLS, FEM, REM) when analyzing the influence of each factor on OFDI investment activities of Vietnamese enterprises in 15 member countries.

- Data are collected from officially published data sources, including annual report on the size of Vietnam’s OFDI capital from Foreign Investment Agency - FIA (Ministry of Planning and Investment), Statistical Yearbook (General Statistics Office). Data on macro indicators of 15 countries receiving Vietnam’s investment are collected from the World Bank, Worldwide Governance Indicators (WGI) from 2010-2021, processed through STATA 14 software.

4. RESULT AND DISCUSSION

4.1. Current situation of Vietnam’s OFDI activities to RCEP member countries from 2010 - 2021

4.1.1. Regarding investment location

According to FIA (2021), Vietnam has a total of 1,448 valid OFDI projects accumulated by 2021 with a total capital of over 20.9 billion USD. OFDI Vietnam’s activities to 14 RCEP member countries accounted for a significant proportion and played a leading role in international investment activities of Vietnam, 963 projects

were approved and licensed (accounting for 66.5% of total project) with a total registered capital of 11,569 billion USD (accounting for 55.4% of total capital scale). Particularly, in 2021 only, Vietnamese enterprises carried out 61 OFDI projects to RCEP countries with an implemented capital of over 409 million USD (up 29.8% over the same period). This is considered a positive sign in the efforts of Vietnamese enterprises to integrate deeply into RCEP member partners’ economies once this Agreement come into force.

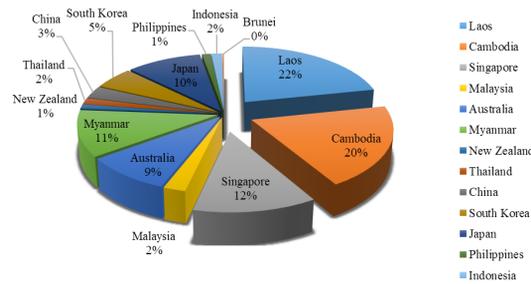

Figure 2. Statistics on the number of OFDI projects of Vietnamese enterprises to RCEP, accumulating valid projects until 31st Dec, 2021

Source: Author's data processing results from FIA (2022)

Figure 2 shows that Laos (209 projects, accounting for 21.7%), Cambodia (190 projects, accounting for 19.73%) and Singapore (118 projects, accounting for 12.25%) are three regions where Vietnamese enterprises conduct OFDI projects actively, accounting for 53.69% of total number of OFDI projects in Vietnam from 2010-2021. However, in terms of total registered capital of Vietnamese enterprises when conducting OFDI to 14 RCEP member countries (Figure 3), it can be seen that projects implemented in Singapore have a large number but the average scale of each project is still small (4,219 USD/project, accounting for about 4.3% of total registered capital). The reason is that Vietnamese SMEs are currently focusing on boosting FDI attraction from Singapore. With the number of valid projects reaching 2,959 with a scale of 69.86 Bil USD (accounting for 16.3% of Vietnam’s total FDI capital by the end of 2021), Singapore is the largest investment partner out of 139 countries investing in Vietnam (Center for WTO&Intl Trade-VCCI, 2022). On the other hand, most of Vietnam’s OFDI projects conducted abroad are focusing on fields that are mainly dependent on natural resources of host country such as mining, oil and gas (32.3% of OFDI Vietnam’s structure), agriculture-forestry-fishery (16%), while Singapore has no strengths in these areas and instead possesses advantages in other areas such as technology, electronics, banking, logistics, which are areas where Vietnamese SMEs are still in poverty of experience, management capacity, leading to the restriction in OFDI scale (FIA, 2021).

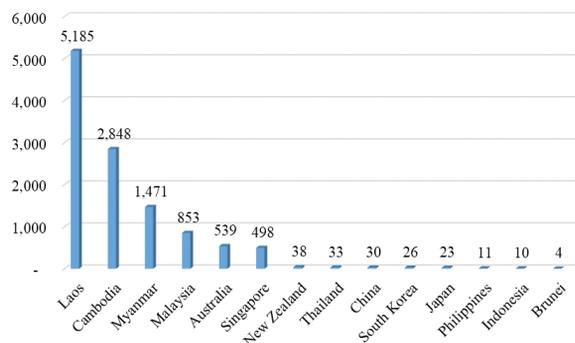

Figure 3. OFDI scale of Vietnamese enterprises to RCEP countries in 2010-2021

Unit: Million USD

Source: Author's data processing results from FIA(2022)

Meanwhile, Myanmar is considered the third-largest market in attracting Vietnamese investors to conduct OFDI, reaching 108 projects with the registered capital of 1,470.57 million USD, accounting for 12.71% of Vietnam's total OFDI capital. Thus, Vietnam's OFDI projects to RCEP in 2010 - 2021 mostly focus on three main markets, namely Laos, Cambodia and Myanmar, and have achieved some encouraging results from a number of pioneering Vietnamese enterprises in the trend of promoting Vietnam's OFDI flows such as Viettel, Vinamilk, Hoang Anh Gia Lai. Reasons explaining these choice of location: **Firstly**, these countries are located in favorable locations, having borders with Vietnam, so it simplifies the movement and transaction process, saving time and investment costs. Particularly, these are neighboring countries with a culture relatively close to Vietnam, so it minimizes disagreements that may arise during OFDI projects, ensuring timely completion. **Secondly**, these countries possess abundant natural resources (land, minerals, forests) along with a cheap labor force while lacking financial capacity and modern technological equipment. Therefore, these resources seem to have not been fully utilized, which are the ideal conditions suitable for Vietnamese enterprises' strengths. **Thirdly**, with the support from the home-country government, OFDI activities of Vietnamese enterprises are deployed smoothly thanks to preferential policies and investment incentives, thereby, bringing them both production efficiency while contributing to efforts to improve the quality of local residents' lives in host country.

4.1.2. Regarding investment stage

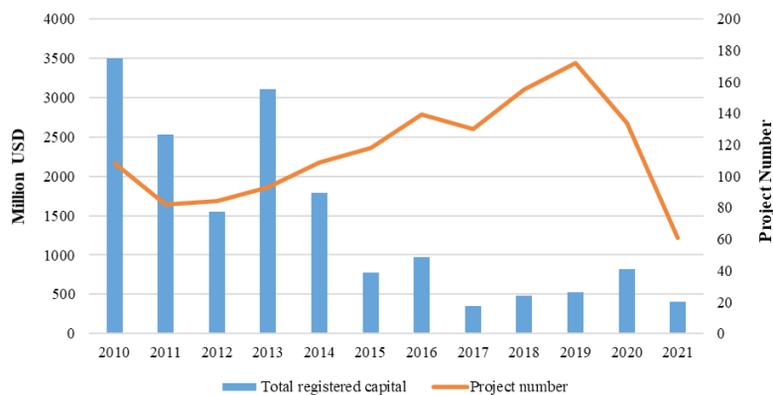

Figure 4. Current situation of Vietnamese OFDI projects to RCEP member countries in 2010-2021

Source: Author's data processing results from GSO (2021), FIA (2022)

Figure 4 shows the implementation of OFDI investment by Vietnamese enterprises to RCEP from 2010 to 2021, which is divided into two phases, specifically:

For the 2010-2016 period: The number of projects, in general, tends to increase steadily. Although the number of projects in the early part of this period decreased significantly, from 108 OFDI projects in 2010 down to 82 projects that were licensed until 2011 (a 24.07% decrease in the number of projects over the same period). However, from 2012 onwards, the number of OFDI projects from Vietnam to RCEP members has increased continuously and peaked in 2016 with a total of 139 OFDI projects implemented (increasing 69.51% compared to 2011). The explanation for this decline in 2010 and 2011 is that Vietnam's economy have suffered heavy consequences due to the impact of the post-world financial crisis and the global economic recession in 2007-2009, causing economic sectors, especially in developing and underdeveloped countries, to struggle and recover. In addition, the total registered OFDI capital of Vietnamese enterprises in this period witnessed strong and unstable fluctuations, peaking in 2010 at 3,503 million USD and falling to the lowest

level in 2015 with 774.8 million USD of OFDI registered capital. The reason for this phenomenon is that in the trend of increasing international integration, the Vietnamese government has issued a series of regulations to encourage SMEs, typically the Investment Law 2005, Decision 236/QD-Circular in 2009 to promote OFDI implementation of Vietnamese enterprises, Decree 83/2015/DN-CP controls the procedures of OFDI activities. However, most of the projects implemented during this period focused on sectors requiring large-scale capital (mining, oil and gas, hydropower, telecommunications) and the majority of OFDI enterprises during this period were state-owned, while the domestic economy faced many challenges due to the influence of global situation, so investment resources have not been balanced over the years.

For the 2016-2021 period: This period witnessed two opposing trends in both the number of OFDI projects and the total registered capital. Specifically, in the first half of this period (from 2016-2019), although there was a slight decline in the previous 2 years, at the end of 2016 and 2017 due to the influence of China’s deceleration and economic downturn in Japan, are considered the two most promising markets in RCEP, but since 2017 (130 projects with 350.1 million USD of registered capital) there has been a remarkable growth and achieved an all-time high in 2019 with 172 valid OFDI projects (up 32.3% compared to 2017) and 528.8 million USD disbursed (up 51.04% compared to 2017).

However, entering the second half of this period (from 2019-2021), Vietnam witnessed a serious decline in both the number of projects and the capital scale. Specifically, from the peak of 172 projects in 2019 to 2021, only 61 OFDI projects were licensed to implement (down 64.5%) with 409 million USD registered for investment by Vietnamese enterprises (down 50.1% compared to 2019). The key reason for this situation is the serious consequences of Covid-19 pandemic, the disruption in supply chain due to social distancing, and the remnants left over until the post-Covid-19 era, which have created causing certain negative consequences, especially serious to the economic pillars of Vietnam and causing SMEs to scale down OFDI projects to focus their resources on restoring the domestic economy.

4.1.3. Regarding investment field

Table 2. Current situation of Vietnamese OFDI activities to RCEP by sector in 2010-2021

No.	Field	Number of new projects	Total registered capital (Mil USD)	Proportion (%)
1	Oil and gas exploration	59	6.758,463	32,33
2	Agriculture-Forestry-Fisheries	118	3.343,923	16
3	Mass communication	145	2.668,009	12,76
4	Electricity, gas, water, air conditioning	9	1.579,124	7,55
5	Manufacturing Industry	143	1.424,876	6,82
6	Art	9	1.016,921	4,86
7	Real estate	52	932.753	4,46
8	Banking, insurance	27	929.286	4,45
9	Invention of technology and science	87	870.263	4,16
10	Retail business	420	757.501	3,62
11	Travel services, restaurants	85	269.679	1,29
12	Other services	64	93.715	0,45
13	Administration, public service	57	92.054	0,44
14	Logistics	44	74.466	0,36

15	Project design	105	68.559	0,33
16	Public Health	8	18.070	0,09
17	Education	15	7.168	0,03
18	Water, waste treatment	1	0.5	0,004
Total		1.448	20.905,336	100

Source: Author's data processing results from FIA (2022)

Table 2 shows that Vietnamese OFDI activities to RCEP countries have increased significantly through diversity in industries and investment fields. Accordingly, OFDI implementation has been expanded from 10 fields in 2000-2010 to 18 fields since 2010 (up 44%). In terms of the number of investment projects, wholesale and retail activities witnessed outstanding growth with 420 projects, accounting for nearly one-third of the total 1,448 licensed projects valid by the end of 2021. In addition, the information and communication industry (145 projects, accounting for 10.01%), processing industry (143 projects, reaching 9.87%), and agriculture-forestry-fishery (118 projects, reaching 8.15%) are the three most active investment sectors of Vietnamese enterprises in these markets. In terms of investment capital scale, mining ranked first with 59 projects with a total capital of 6,758.46 million USD, accounting for 32.33% of Vietnam's OFDI capital structure to RCEP in 2010-2021. Next are the fields with the strengths of Vietnamese investors in agriculture-forestry-fishery (16%), telecommunications (12.76%). In addition to these traditional sectors that require a long investment period, Vietnamese SMEs also confidently redirect OFDI investment to new industries that contain more risks such as real estate (4.46%), banking (4.45%). Particularly, Vietnamese SMEs tend to focus on fields requiring high professional qualifications and intellectual content like manufacturing industry (6.82%), professional and scientific research (4.16%). Besides helping Vietnamese SMEs to make full use of strategic assets that they own, this is also a direction to create more added value while improving the quality of OFDI projects for Vietnamese investors.

4.3.4. Regression model selection test

Table 3. Regression results of factors affecting OFDI activities of Vietnamese enterprises to RCEP member countries

Model	(1)	(2)	(3)

*(***) 1% significance level, (**) 5% significance level, (*) 10% significance level*

Source: Author (2023)

Table 3 shows the results of regression models that I use to estimate: (1) Pooled OLS regression model; (2) Fixed-effects model (FEM); (3) Random effects model (REM). Accordingly, the independent variables in Pooled OLS explain 86.3% of the variation of OFDI capital flows from Vietnamese SMEs to RCEP countries ($R^2=0.863$). However, this Pooled OLS estimate does not show whether or not there is a (random/fixed) impact of individual RCEP country characteristics, e.g. each country’s legal institutions, geographical distance to this activity. Therefore, I use F-test to see if there is a fixed influence of these differentiating factors from RCEP countries to Vietnam’s OFDI activity and this will be the basis for deciding whether to choose Pooled OLS or FEM. The test result receives $\text{Prob}>F=0.0001 < 5\%$, so H_0 : “The Pooled OLS model is suitable” was rejected, which means FEM is selected in this case at a significance of 5% (Appendix 04).

Next, I carried out Breusch - Pagan Lagrangian test to examine the suitability of REM compared to PooledOLS and found that REM model was consistent with a 95% confidence interval (Appendix 05). Therefore, Pooled OLS model is not recommended after comparing both cases. Following this, I used Hausman test to choose FEM or REM. The result is $\text{Prob}>\chi^2=0.0000$, which means that FEM is consistent with research data at 95% confidence interval (Appendix 06).

After that, I performed tests to check the compliance with the assumptions of FEM model, including (1) Autocorrelation test and (2) Heteroskedasticity test:

(1) Autocorrelation occurs when random errors in regression model using panel data correlate with each other, i.e. violate the assumption $\text{Cov}(u_i, u_j) = 0$. Although the estimated result is unbiased linearity but autocorrelation falsifies the t-Student and F-test values, leading to unreliable regression results (Nguyen Quang Dong, 2012). Therefore, I used Wooldridge test to detect autocorrelation in FEM model. The test results show that $\text{Prob}>F=0.0001 < \alpha=5\%$, the conclusion rejects hypothesis H_0 (H_0 : The model does not have autocorrelation), means FEM appears autocorrelation at 5% significance level (Appendix 7).

(2) The classical linear regression model assumes that the variance of random errors is constant. The model’s violation of this assumption causes statistical inference of regression parameters based on the t and F distributions with low confidence. Thus, I used Breusch-Pagan to examine whether FEM has heteroskedasticity. The results showed $\text{Prob}>\chi^2=0.0000 < \alpha=5\%$, which means that this model has heteroskedasticity at 5% significance level (Appendix 8).

4.3.5. Regression model results

FEM model appears simultaneously with both defects as heteroskedasticity and autocorrelation through Modified Wald, Wooldridge tests at 5% significance level. Thus, Feasible Generalized Least Squares (FGLS) estimation is recommended tool to fix these defects on the basis of recalculation and increase statistical inference reliability of regression parameters.

Table 4. Estimation results of FGLS model of factors affecting OFDI activities of Vietnamese enterprises to RCEP

Model	FGLS	Model	FGLS
Variable	lnOFDI	Variable	lnOFDI
lnPCGDP	0.0348 (0.08)	ros	0.0707*** (5.88)
tra	0.00286* (1.92)	nat	0.2509*** (6.18)
lnIFDI	0.4485*** (5.12)	lab	198.2*** (10.04)
inf	-0.000474 (-0.01)	pol	0.0323*** (3.40)
fac	0.0245*** (3.19)	Constant	-7.411*** (-2.58)
pri	-1.6982*** (-2.70)	Observations	801
		R-squared	0.6159

Standard deviation values in parentheses

*(***) 1% significance level, (**) 5% significance level, (*) 10% significance level*

Source: Author (2023)

The Wald Chi2 test in FGLS model (Appendix 9) gives the result Prob>chi2=0.0000, which proves that the model estimated in this study has completely overcome all defects and has a high degree of suitability at a 5% significance level.

4.4. Discussion

Labor productivity has the strongest influence in encouraging Vietnamese investors to carry out OFDI to RCEP markets. This is explained by the fact that Vietnam’s OFDI projects in 2010-2021 mostly focus on labor-intensive fields, requiring an abundant human resources to be able to conduct production, e.g. mining, oil and gas (32.3%), agro-forestry-fishery (16%), processing-manufacturing industry (6.82%) (FIA, 2021). Therefore, the more countries possess rich labor force, the more motivated Vietnamese investors will be to carry out OFDI in these countries. Particularly, China, Cambodia, and Indonesia are top-three potential markets that Vietnamese enterprises are focusing on exploiting in the race of cutting labor costs. Moreover, besides the quantity requirements, the workforce’s quality is also prioritized to consider because businesses are struggling with innovation requirements in the context of the explosion of industrial revolutions. Currently, Vietnamese enterprises redirect their investment to industries that require high technology application to increase labor productivity. This requires a high level of knowledge about host-country workforce. Thus, countries possessing skilled and high-performing labor force will be prioritized by Vietnamese SMEs to consider as destination of OFDI flow.

Natural resource in RCEP member countries also had a significant influence on implementing OFDI from Vietnam at a 1% significance level. Vietnamese enterprises invest in foreign markets to seek production

efficiency by taking advantage of available natural conditions in host country to promote their strengths. The reason comes from investment fields' characteristics are highly dependent on natural resources such as oil and gas, land for growing industrial crops, and hydropower. Meanwhile, domestic production faces many difficulties due to the limited resources while the number of enterprises operating in these industries is continuously increasing, putting great pressure on some Vietnamese enterprises. Thus, OFDI is a proper solution for them to seek production efficiency in foreign markets. As a result, countries with rich resources such as Laos, Brunei, and Australia will attract Vietnamese investors. However, natural resources serve as a national treasure that is valuable asset of an economy, so countries are acutely aware of the urgency in tightening the conservation of their own resources. This process will place certain barriers and restrictions on foreign investors operating in these industries (Seyfettin, 2021). Thus, Vietnamese SMEs need to actively develop appropriate investment diversion plans in the near future.

Meanwhile, infrastructure of RCEP countries has a positive impact on attracting Vietnam's OFDI flows to these markets at 1% significance level. This result is considered a new finding of this study because it is in stark contrast to the previous conclusions when studying Vietnam's OFDI capital flows. While Nguyen Thi Ngoc Mai (2018) said that this factor had no impact, Trinh Quang Hung (2021) argued that infrastructure has a negative impact, causing OFDI Vietnam's investment to decline. Specifically, when increasing infrastructure costs by 1%, Vietnamese SMEs' OFDI decreased by 0.03% provided that other factors were fixed. The basis for these authors to make such a judgment is due to the fact that Vietnamese SMEs currently account for the majority of Vietnam's economy, more than 98% (GSO, 2022), leading to investment in developed economies such as Australia, Japan, Singapore will create a large cost burden for Vietnamese SMEs. On the other hand, some authors also stated that Vietnamese enterprises' capacity is still weak, so it is just suitable for countries with similar qualifications such as Cambodia, Laos and Myanmar. However, this study found that developed economies with modern infrastructure are Vietnamese SMEs' choice when investing in RCEP. The reason is that under the government's recent policy of promoting investment in the international market, the strengthening of cooperation between Vietnam and other countries helps SMEs enjoy much preferential treatment from these policies. Therefore, financial issues are no longer a decisive factor in the investment. Instead, Vietnamese SMEs currently go abroad to seek strategic assets of host country, and recent investment areas have witnessed a significant increase in the high technology application in accordance with the trend of the industrial revolution 4.0. Therefore, a market with adequate infrastructure, especially developed countries in RCEP such as Japan, Korea, Australia will create favorable conditions for Vietnamese enterprises to cut initial investment activities, optimize costs and shorten OFDI project implementation time.

The regression coefficient of IFDI from RCEP into Vietnam has a positive value, implying that this factor has a positive influence in promoting Vietnam's OFDI back to those that invest at a 1% significance level. When the amount of IFDI capital received by Vietnam increases by 1%, it will lead to an increase of 0.45% in Vietnam's OFDI outflows. The reason is that when an economy receives IFDI inflows from another country, it will create proper conditions for domestic supporting industries to have the opportunity to be developed to stimulate the production process take place quickly. Thereby, encouraging domestic enterprises to promote outward investment in production networks. In addition, the return on revenue ratio in RCEP also affects the encouragement of OFDI investment from Vietnam at a 1% significance level. By promoting the internal advantages, most parent companies in Vietnam will gradually shift and replace external transactions to save costs and operate safely. Furthermore, RCEP countries have enhanced linkages in the regional production network by establishing subsidiaries in member countries of MNCs Korea, Japan, and Singapore. Moreover, tariff barriers tend to be removed when participating in international integration, causing the Corporate Incomes Tax (CIT) rate to gradually decrease, encouraging Vietnamese investors to increase investment activities in this region.

The stable political situation and absence of violence in RCEP have positive implications for promoting Vietnamese OFDI investment at a 1% significance level. OFDI activities require a long investment process and this is closely related to risk-taking ability of investors when deploying projects abroad. In fact, investment flows from Vietnam tend to be limited into countries where war and terrorism take place with high frequency as well as low political stability index like Myanmar (9.91%), Thailand (13.27%), Indonesia (24.76%) (WGI, 2021). These are places where Vietnamese SMEs will be more disadvantaged because of potential risks due to institutional distance between two countries as well as understanding host country's market restricted than domestic investment (Tran Hoai Nam, 2021). Therefore, countries with stable political regime and transparent legal regulations will have strategic implications for businesses. In addition, the results also show that economic openness of RCEP countries has a positive influence on the increase of OFDI sources from Vietnam to this region. When the host state creates an open investment environment by reducing administrative procedures and increasing preferential policies, it will support enterprises easily access deeper into partner country market. However, this result is true at the significance level of 10%, which implies that when joining RCEP, countries have been obliged to make commitments to promote investment promotion in the region extensively in accordance with the goals of RCEP agreement, so member countries have basically created an open mechanism to welcome investors and ensure the implementation of preferential regimes. Therefore, although this factor has a positive impact, its role does not have a significant impact on OFDI by Vietnamese SMEs at this stage.

In contrast, price level ratio of PPP conversion factor (GDP) to market exchange rate in RCEP markets negatively affects Vietnam's OFDI capital flows at 1% significance level. The reason for this situation is the conversion of local currency into USD is mainly for the disbursement of projects while USD/VND exchange rate fluctuates strongly and tends to increase frequently (on average 1.5% to 2%/year), causing Vietnamese investors to spend more local currency in exchange for foreign currency (Truong Van Phuoc, 2022). This will cause great barriers for Vietnamese SMEs with limited capital, especially in the post-Covid-19 recovery period when implementing OFDI projects. In addition, the size of GDP/person in RCEP does not affect OFDI flows of Vietnamese SMEs at 10% significance level. This result also agrees with Chen (2022) when saying that investors from developing countries invest overseas, the search for economies of scale and output optimization will depend on the characteristics of different organizational structures in each business when possessing different capabilities and strategies. Additionally, this study also found that inflation is not statistically significant at 10%, implying that this factor does not affect the decision to conduct OFDI from Vietnam to RCEP region. Since inflation causes distortions in relative prices, some investors cannot be wise in the decision-making process to carry out OFDI activities.

5. CONCLUSION

In current context, participating in trade facilitation agreements is an inevitable trend when opening up the economy, OFDI is strategic orientation compatible with actual conditions in Vietnam to exploit incentives that these agreements bring. Therefore, this study has outlined an overview, contributing to changing the perspective of business executives in conducting OFDI projects from a developing country as well as minimizing hesitations in the early-stage of this agreement application.

By proposing panel data regression model, I quantified the impact level of factors on OFDI activities of Vietnamese enterprises in RCEP from 2010–2021. The discussion analysis helped concretize the meaning of quantitative analysis and shortening the gap in previous research. Moreover, this study has discovered some new findings compared to previous research, e.g infrastructure factor that has a positive impact on attracting OFDI investment flows from Vietnam. Besides the characteristics of host country that has positive implications for OFDI activities, including openness of economy, and the amount of IFDI flows Vietnam receives from RCEP, this activity is also subject to the influence of the group of factors about production

and business conditions, including infrastructure, price index converted at market exchange rates, return on revenue ratio, natural resources, labor productivity along with the group of factors from host-country government as shown in the index of political stability and absence of violence. Thereby, Vietnamese enterprises need to show a proactive spirit and promote their internal strengths on the basis of combining efforts from the government to maximize benefits brought by this agreement. Since then, Vietnamese enterprises can grow and affirm their position in the process of deep integration into RCEP markets.

EFFECTS OF ICT DEVELOPMENT ON ECONOMIC GROWTH: AN EMPIRICAL STUDY OF DEVELOPING COUNTRIES

**Author: Nguyen Duong Viet Anh¹, Nguyen Thuy Trang², Nguyen Ngoc Thao Huong²
Mentor: Pham Xuan Truong³**

ABSTRACT: *This paper aims to analyze effects of ICT development on economic growth in developing countries. By using the sample of 44 developing nations and the pool mean group (PMG) estimator, the effects of ICT factors (mobile cellular, fixed broadband, fixed telephone, and internet) were evaluated not only on the whole sample but also on different groups of countries by regions and income levels. Results show that, while all ICT variables have positive long-run effects on economic growth, the short-term effects are still controversial under different circumstances. From research results, we give further discussion and policy recommendations for developing countries to develop and apply ICT in economic aspects.*

Keywords: *ICT development, Economic growth, Developing countries*

1. INTRODUCTION

Theoretically, ICT and economic growth have a strong association, as demonstrated by neoclassical ideas (Solow, 1956; Schumpeter, 1994). According to these views, ICT contributes to the economic supply as capital and enhances the production process by increasing prosperity, advancing technology, and improving the quality of the labor force. ICT is expected to create added values for enterprises and sectors, as well as to promote economic growth at the national level (Aghaei and Rezagholizadeh, 2017; Bahrini and Qaffas, 2019; Adeleye and Eboagu, 2019; Cheng *et al.*, 2021; Appiah-Otoo and Song, 2021). Practically, ICT has the ability to extend accessibility to the population in developing countries that lives outside of ICT networks; increase access to more advanced ICT services; and improve service delivery by the new ICT infrastructure, then contributes to economic aspects.

Since the 21st century, studies have concentrated on researching the impacts of ICT on economic growth, especially at the cross-country level due to the growing significance of ICT and the ways in which it is changing the world. However, not many studies on developing countries have thoroughly examined how ICT elements affect economic growth. Several earlier research that concentrated on developing nations used cross-country data and various econometric models to perform empirical studies to explore the connection between ICT diffusion and economic growth (Aghaei and Rezagholizadeh, 2017; Bahrini and Qaffas, 2019; Hussain *et al.*, 2021). Many studies still provided unclear results, and there were debates among academics about the issue of whether ICT spread in the setting of developing countries had a large growth-enhancing effect. As a result, further research into this matter is still possible as not many studies have fully analyzed how ICT factors contribute to economic growth, especially in developing nations. Also, by the updated data of developed economies, the authors expect to clarify results of ICT on economic growth.

In acknowledgment of ICT's importance in developing economies, we choose the topic "Effects of ICT development on developing countries' economic growth". This topic is expected to analyze the

² Foreign Trade University.

³ Foreign Trade University, Email: truongpx@ftu.edu.vn

impacts of ICT Development on Economic Growth in developing countries, then give policy implications for countries to develop ICT aspects and apply them in economic activities.

2. THEORETICAL FRAMEWORK

2.1. Definitions

2.1.1. ICT development

The term “Information and Communication Technologies” (ICT) is defined as a diverse set of technological tools and resources used to transmit, store, create, share, and exchange information (UNESCO, 2009). Computers, the Internet (websites, blogs, and emails), live broadcasting technologies (radio, television, and webcasting), recorded broadcasting technologies (podcasting, audio and video players, and storage devices), and telephony (fixed or mobile, satellite, vision/video-conferencing, and so on) are examples of these technological tools and resources. From this definition, it can be understood that ICT covers all advanced resources, tools and equipment that help to send information. More simply, “ICT” refers to the blend of manufacturing and service industries that electronically capture, transmit, and display data and information (OECD, 2002). In general, ICT is understood as capital and infrastructure aspects.

ITU (2017) defined measurement of ICT development: ICT access – reflecting the level of networked infrastructure and access to ICTs; ICT use – reflecting the level of use of ICTs in the society; and ICT skills – reflecting the outcomes of more efficient and effective ICT use. The sub-components of these stages are given in the Table 1.

Table 1. ICT development measurement

ICT measurement	Indicators
ICT access	Fixed-telephone subscriptions
	Mobile-cellular telephone subscriptions
	International Internet bandwidth per Internet user
	Households with a computer
	Households with Internet access
ICT use	Individuals using the Internet
	Fixed-broadband subscriptions
	Mobile-broadband subscriptions
ICT skills	Mean years of schooling
	Gross secondary enrolment
	Gross tertiary enrolment

Source: ITU, 2017

2.1.2. Economic growth

Economic growth is one of the most popular terms in economic studies, which have been defined in different ways since the 20th century. Kuznets (1973) defined national economic growth as a long-term rise in capacity to provide diverse economic goods to residents, which is based on advanced technologies and institutional and ideological changes that country requires. Also in this definition, technology is considered as a permissive source of economic growth, but it is not the sufficient condition itself. More simply, growth is mentioned as an increase in terms of measurable quantity, which is different from “development” that is in way of qualitative changes (Flammang, 1979). Early definitions agreed that economic growth is simply the rise in quantity of goods and resources.

Since the 21st century, economic growth has been officially defined in international organizations. Growth in an economy is measured by change in the volume of its output or in the real expenditure or income of its residents (United Nations, 2008). From this definition, it can be understood that economic growth is changes in a nation's outputs or in its income per capita. The United Nations System of National Accounts provides three plausible growth indicators: the volume of gross domestic product (GDP), real gross domestic income, and real gross national income. Among these, GDP is the sum of the value added by households, government, and industries operating in the economy, measured at constant prices. Moreover, GDP accounts for all domestic production, whether the income is received by domestic or foreign institutions. As can be seen from these official definitions, GDP is preferred to be calculated at constant currencies (usually USD), as well as considers foreign institutions.

2.2. Literature review

Since the 21st century, a great numbers of research have been conducted in developing nations on the effects of ICT factors on economic growth, despite the fact that there have been conflicting findings regarding the impacts of these factors.

Ahmed and Ridzuan (2012) analyzed the effects of ICT investments on countries' GDP, which found long-term connections between GDP and production variables. Aghaei and Rezagholizadeh (2017) also found the positive effects of ICT investments on the economic growth of Organization of Islamic Conference (OIC) nations. However, these studies only discussed ICT in terms of investment aspects and leaving out other factors such as infrastructure, ICT human resources and other considerations.

Beside factors of ICT investments or ICT capital mentioned above, variables of ICT infrastructure such as mobile cellular, fixed telephone, fixed broadband, and Inter-net are also expected to significantly contribute to economic growth. Several studies have incorporated ICT infrastructure variables into their development models in recent years. Pradhan et al. (2015) found significant contributions of Internet and broadband on 21 Asian economies. Similarly, Sapuan and Roly (2021) assessed ICT growth in ASEAN countries based on two infrastructural indicators: fixed broadband subscribers and percentage of Internet usage and also discovered positive impacts of ICT development on economic growth of ASEAN members. Shodiev et al. (2021) proved that ICT factors have positive and statistically significant effects on GDP of Central Asian countries. Nevertheless, the research only included two variables of infrastructure development and there were no capital and labor factors in the growth models. Conversely, Cheng et al. (2021) asserted that only mobile subscribers contribute to economic growth, whereas internet infrastructure and services have no significant impacts in middle-income and low-income nations. Furthermore, the research stated that ICT dispersion can enhance economic growth in developed nations while the influence in developing ones is ambiguous. Hussain et al. (2021) developed a growth model using three ICT infrastructure variables: internet users as a proportion of the population, fixed-telephone subscribers per 100 people, and mobile-cellular subscribers per 100 people, which were found to significantly contribute to economic growth of South Asian countries. Adeleye and Eboagu (2019) identified positive contributions of the Internet, mobile cellular, and fixed telephone to economic growth. Albiman and Sulong (2017) identified minimal and negative impacts of these infrastructural elements on the economic growth of Sub-Saharan African nations and suggested that lower-middle-income countries had greater first-mover advantages in absorbing the benefits of ICT. Meanwhile, Appiah-Otoo and Song (2021) found positive effects of ICT variables on both middle-income and low-income nations. Belloumi and Touati (2022) examined both long-run and short-run effects of ICT factors on 15 Arabian economies, which only showed long-run contributions of Internet and

fixed telephone to growth. Also, Bahrini and Qaffas (2019) found different results of ICT factors' effects on developing nations.

3. RESEARCH METHODOLOGY

3.1. Model specification

Based on previous studies on growth models with ICT factors (Albiman and Sulong, 2017; Adeleye and Eboagu, 2019; Hussain et al., 2021...), the growth function is proposed as follows:

$$GDP_{it} = A_{it} L_{it}^{\beta_1} K_{it}^{\beta_2} X_{it}^{\beta_3} ICT_{it}^{\beta_4} e^{u_{it}} = f(A_{it}, L_{it}, K_{it}, ICT_{it}) \quad (*)$$

Where GDP_{it} is the total GDP of the country i , year t ; A_{it} is the technological parameter; L_{it} is the total labor force; K_{it} is the gross fixed capital formation; X_{it} is the vector of control variables; ICT_{it} is the vector of ICT variables; u_{it} is the random disturbance. By taking natural logarithms, the equation (*) is rewritten as follows:

$$\ln GDP_{it} = \beta_0 + \beta_1 \ln L_{it} + \beta_2 \ln K_{it} + \beta_3 \ln X_{it} + \beta_4 \ln ICT_{it} + u_{it} \quad (**)$$

In this paper, to measure ICT development, 4 indicators: Mobile Cellular subscriptions, Fixed Broadband subscriptions, Fixed Telephone subscriptions, and Internet individual users are chosen. These indicators were commonly used in previous studies to measure contributions of ICT to economies (Albiman and Sulong, 2017; Adeleye and Eboagu, 2019; Appiah-Otoo and Song, 2021; Hussain et al., 2021; Belloumi and Touati, 2022). The models also include total labor force (L_{it}), gross fixed capital formation (K_{it}), and trade openness ($trade_{it}$) as control variables.

Deriving the equation (2) with the natural logarithm, the growth functions with ICT factors are written as follows:

$$\ln GDP_{it} = \beta_0 + \beta_1 \ln L_{it} + \beta_2 \ln K_{it} + \beta_3 \ln trade_{it} + \beta_4 \ln mob_{it} + u_{it} \quad (1)$$

$$\ln GDP_{it} = \beta_0 + \beta_1 \ln L_{it} + \beta_2 \ln K_{it} + \beta_3 \ln trade_{it} + \beta_4 \ln fbb_{it} + u_{it} \quad (2)$$

$$\ln GDP_{it} = \beta_0 + \beta_1 \ln L_{it} + \beta_2 \ln K_{it} + \beta_3 \ln trade_{it} + \beta_4 \ln ft_{it} + u_{it} \quad (3)$$

$$\ln GDP_{it} = \beta_0 + \beta_1 \ln L_{it} + \beta_2 \ln K_{it} + \beta_3 \ln trade_{it} + \beta_4 \ln inte_{it} + u_{it} \quad (4)$$

Where: $\ln GDP_{it}$ is the natural logarithm of GDP; $\ln K_{it}$ is the natural logarithm of gross fixed capital formation; $\ln L_{it}$ is the natural logarithm of total labors; $\ln trade_{it}$ is the natural logarithm of trade openness; $\ln mob_{it}$ is the natural logarithm of Mobile Cellular subscriptions; $\ln fbb_{it}$ is the natural logarithm of Fixed Broadband subscriptions; $\ln ft_{it}$ is the natural logarithm of Fixed Telephone subscriptions; $\ln inte_{it}$ is the natural logarithm of Internet individual users.

3.2. Analyzing methods

3.2.1. Unit-root and cointegration test methods

In this research, the Levin-Lin-Chu unit-root test was used (Levin et al., 2002). The null hypothesis and the alternative hypothesis for the panel unit root test are given as follows:

$$\begin{cases} H_0: \text{Panels contain unit roots} \\ H_a: \text{Panels are stationary} \end{cases}$$

To test cointegration, the Kao test was used, which is based on the residual of cointegrating regression (Kao, 1999). The null hypothesis and the alternative hypothesis for the panel cointegration test are given as follows:

$$\begin{cases} H_0: \text{No cointegration} \\ H_a: \text{All panels are cointegrated} \end{cases}$$

3.2.2. Causality test methods

In this research, the Granger causality test (Granger, 1969) was used to examine causality relationship between variables. The null hypothesis and the alternative hypothesis for the Granger causality test are given as follows:

$$\begin{cases} H_0: X \text{ does not Granger cause } Y \\ H_a: X \text{ does Granger cause } Y \end{cases}$$

3.2.3. Estimation method

In this paper, the Pooled Mean Group (PMG) estimator was used to analyse effects of independent variables on the dependent variable. PMG is used for this study as it imposes on long-run coefficients while allowing short-run coefficients to vary freely across countries (Pesaran and Smith, 1995). Some previous studies also used the PMG estimator to analyse long-run and short-run effects of ICT on economic growth (Salahuddin and Alam, 2016; Albiman and Sulong, 2017; Kallal et al., 2021; Belloumi and Touati, 2022).

3.3. Data collection

The data was collected from World Bank data. The summary of variables is given in the Table 2. The sample covers 44 developing countries with the time range of the 1990-2021 period (Appendix A).

Table 2. Data summary

Variable	Explain	Unit	Data sources
GDP_{it}	Total GDP	USD	World Bank data
K_{it}	Gross fixed capital formation	USD	World Bank data
L_{it}	Total labor force	People	World Bank data
$trade_{it}$	Total export and import values as percent of GDP	%	World Bank data
mob_{it}	Mobile cellular subscriptions	Subscriptions	World Bank data
fb_{it}	Fixed broadband subscriptions	Subscriptions	World Bank data
ft_{it}	Fixed telephone subscriptions	Subscriptions	World Bank data
$inte_{it}$	Internet individual users	People	World Bank data

Source: Compiled by authors

In this paper, 44 countries were chosen as a sample of developing nations. These developing nations' data were collected from the World Bank with a time range from 1990 to 2021. This yearly time range included adequate information of ICT indexes and other economic data of the sample. Also, this period witnessed a rise in ICT development of emerging economies.

4. RESULTS AND DISCUSSION

4.1. Results

4.1.1. Sample descriptive statistics

The results of sample descriptive statistics are given in Table 3. As can be seen from these results, all variables have mean values much higher than standard deviations. The mean value of natural logarithm of the dependent variable is 26.347. Meanwhile, mean values of ICT variables range from about 14 to 17.

Table 3. Sample descriptive statistics results

	ln_gdp	ln_l	ln_k	ln_trade	ln_mob	ln_fbb	ln_ft	ln_inte

4.1.2. Results of unit-root and cointegration tests

Table 4 shows that all variables in the model are stationary at level. Two explanatory variables, labor force and gross fixed capital formation, are stationary with the 5% significance level. Other variables are found to have the 1% significance level. These results suggest that it is suitable to use variables' values at level in models.

Table 4. Unit-root test results

Variable	t-statistic
$\ln gdp_{it}$	-3.125***
$\ln L_{it}$	-1.747**
$\ln K_{it}$	-1.987**
$\ln trade_{it}$	-7.971***
$\ln mob_{it}$	-5.221***
$\ln fbb_{it}$	-33.571***
$\ln ft_{it}$	-21.458***
$\ln inte_{it}$	-13.927***

Note: *** is significant at 1%; ** is significant at 5%; * is significant at 10%.

Source: Compiled by authors

Results of the Kao test (Table 5) show that all variables in chosen models have cointegration relationships, with the significance level at 1%. All the values off t-statistic are significant at the 1% level.

4.1.3. Results of causality test

Results of the Granger test (Table 6) show that, all independent variables have causality relationships with the dependent variable. Therefore, these variables are significant in predicting the dependent variable.

Table 6. Granger causality test results

4.1.4. Estimation results

a) Overall effects of ICT on economic growth

As can be seen in the Table 7, all ICT variables have positive long-run effects on the dependent variable. Among these, fixed telephone has the highest coefficient at 0.144, followed by mobile cellular at 0.048. Meanwhile, fixed broadband has the lowest coefficient at only 0.003. All these effects are statistically significant at the 1% level. Similarly, the group of control variables also has significant contributions to economic growth in long terms.

Table 7. Long-run PMG estimation results, overall

Dependent variable: $\ln GDP_{it}$

Source: Compiled by authors

Meanwhile, the overall short-run estimation results (Table 8) show that, only fixed telephone lines are significant to GDP growth in short terms. Although two ICT variables, fixed broadband and Internet have positive short-run coefficients on the dependent variable, these results are insignificant. In addition, among the group of control variables, only labor force has short-run contributions to economies, while effects of gross fixed capital formation and trade openness are insignificant.

Table 8. Short-run PMG estimation results, overall

b) Effects of ICT on economic growth by regions and countries

When examining the effects of ICT on different regions, it was found that all ICT variables have positive long-run coefficients on all regions: Africa, Asia-Pacific, Europe, and America-Latin (Table 9). Results show that among ICT factors, mobile cellular and Internet have largest long-run effects on economic growth with coefficients at about 0.1. All the coefficients are statistically significant.

However, regarding short-run effects, it is noticeable that ICT factors have different results on different countries. In the group of African nations, for example, mobile cellular has negative coefficients on 5 African economies (Angola, Ghana, Ivory Coast, Namibia, Nigeria) and insignificant effects on 2 countries (Botswana, Tunisia), and Morocco is the only one to have positive coefficients of all ICT variables, three of which are statistically significant. By contrast, Nigeria witnesses short-run negative effects of all ICT variables on economic growth. Regarding short-run effects of ICT on Asian-Pacific countries, only Indonesia and India that witness positive and significant coefficients of all ICT variables, while others still see negative and/or insignificant effects of some ICT factors on economic growth. Groups of European and American-Latin also witness the similar results of ICT factors' short-run contributions to economic growth. The results of ICT's short-run effects on countries are given in the Appendix B.

Table 9. Long-run effects of ICT on economic growth, by regions

Dependent variable: $\ln GDP_{it}$

c) *Effects of ICT on economic growth by income levels*

Results (Table 10) show that, the group of upper-middle-income countries witness significant long-run contributions of two ICT variables: Mobile cellular and Internet, which have positive coefficients at 0.029 and 0.026 respectively. However, fixed broadband and fixed telephone do not have significant effects on economic growth. About short-run effects, only mobile cellular has significant coefficients on upper-middle economies. Meanwhile, the group of lower-middle-income nations finds no significant effects of ICT factors in long and short terms. This can be explained by the fact that nations with low-income levels have barriers in applying ICT aspects due to lacks of investment sources as well as human resource problems.

Table 10. Effects of ICT on economic growth, by income groups

4.2. Discussion

As mentioned in the estimation results, all ICT variables: Mobile cellular, Fixed broadband, Fixed telephone, and Internet have positive and significant long-run effects on economic growth, both in the sample overall and in sub-groups of Africa, Asia, Europe and America and Latin. These results are contrary to previous studies that only showed long-run effects of some ICT infrastructure factors on developing

countries (Albiman and Sulong, 2017; Cheng et al., 2021), but consistent with the study by Hussain et al. (2021) which also claimed the long-run effects of all ICT variables on economies. In addition, as technological inputs, ICT factors affect supplies which makes production more economical then increase productivity. However, this also leads to higher demands in human resources and investments in digital education and training (Quah, 2002).

Meanwhile, the short-run effects of ICT on economic growth are found insignificant in this paper. These findings imply that due to lacks of ICT policies formulation and unequal penetration of infrastructure, developing nations find barriers in adopting effects of ICT in short terms. Moreover, it can be explained by the fact that ICT infrastructure needs long periods to be effective as well as ICT is not the only one that significantly improve economic growth. As shown in the results, the effects of ICT factors are considerably lower than other inputs such as labor force and gross fixed capital formation. These also suggests that only development of infrastructure is not enough to significantly contribute to economies, but it is necessary to consider sectors, organizations and consumers' ICT using and spending. Another possible reason is that because of low income levels, some nations do not have enough resources to invest and develop digital economies as well as improve human resources, which lead to ineffectiveness of ICT in the short-run.

Regarding effects of ICT factors on sub-groups of different regions, all sub-groups of African, Asian-Pacific, European, and American-Latin nations see significant effects of ICT on economic growth in long terms, but there are very little short-run effects. For example, the group of African developing nations witness long-run contributions of ICT to economic growth, while there are no significant short-run impacts. These findings are consistent with previous studies on the sub-regions of Africa (Albiman and Sulong, 2017; Adeleye and Eboagu, 2019). The same results are also found in the sub-groups of Asian-Pacific, European, and American-Latin countries, which again support the assumptions that developing countries need long-enough periods to effectively adopt ICT development in economies. However, it is noticeable that short-run cross-nation effects of ICT on some countries are still significant, while those of others are not. This can be explained by differences in infrastructure conditions, investments, development policies and even quality of human resources that lead to different effects of ICT aspects on nations. Among ICT variables, fixed telephone is the only one to have short-run contributions to economic growth, but only seen in the groups of Asia-Pacific an America-Latin. These suggest that in these two regions, development of fixed telephone infrastructure and services is more effective than others, which significantly affect developing economies.

About results of ICT on countries by income groups, lower-middle-income nations see no significant effects of ICT variables on economic growth. One possible explanation is due to economic barriers, countries do not have enough resources for ICT investment and development, which leads to ineffectiveness of ICT. Furthermore, lacks of resources for human development, especially in educating and training ICT aspects can prevent the development of digital economies. Meanwhile, upper-middle-income countries see positive long-run effects of mobile cellular and Internet, but there are not any significant short-run contributions of ICT to economic growth. This implies that countries with higher income levels have advantages in investing and developing aspects of mobile phones and Internet infrastructure, which possibly encourages people to consume ICT products and promotes economic growth in the long-run.

5. CONCLUSION

This paper examines contributions of ICT development to developing economies in both short and long terms. To measure ICT development, the authors chose 4 indicators: Mobile cellular, fixed broadband subscriptions, fixed telephone subscriptions, and Internet users. By using the log-log model and the PMG

estimator, the authors investigated effects of ICT variables on 44 developing countries during the 1990-2021 period. Results show that all ICT factors (Mobile cellular, fixed broadband subscriptions, fixed telephone subscriptions, and Internet users) have long-run effects on economic growth but there are no significant short-run effects on the overall sample. Meanwhile, when analyzing the cross-section short-run effects of ICT factors, there are different results between countries and/or sub-regions, which can be explained by differences in ICT development policies, unequal penetration and investments between nations. Beside ICT factors, developing economies are significantly improved by labor force, gross fixed capital formation, and trade openness.

The paper built growth models with a vector of ICT variables (Mobile cellular, fixed broadband subscriptions, fixed telephone subscriptions, and Internet users). In addition, when employing the PMG estimator, it is possible to evaluate overall long-run effects of independent variables while short-run effects vary between countries. Theoretically, this also suggests that beside the long-run effects of ICT on the whole sample, it is important to evaluate and compare effects of this factor between nations and/or regions due to institutional and regional differences. Also, empirical evidence in developing countries were provided, which showed different results of ICT variables' effects on economies.

The paper also implied policy recommendations for developing nations to boost their ICT development as well as make ICT an important part in economies. As ICT factors have little short-run effects on developing economies, governments and authorities need to be patient and consistent with ICT development strategies and objectives. Also, to develop ICT and get effectiveness in the long-run, our research model implies that there needs to be investment in ICT infrastructure (mobile cellular, fixed broadband, fixed telephone, Internet) as well as promote markets of ICT and digital products and services. Furthermore, it is important to have suitable policies in educating and training ICT human resources. In addition, there are two-way relationships between ICT development and economies, by the results showing that upper-middle-income countries are more effective than lower-middle-income countries in developing ICT. This means that not only ICT promotes economic growth but economic growth also creates conditions for ICT development through favorable markets and advanced human resources.

Future researches can be improved if they can solve these limitations. First, in recent years, there have been different shocks such as the pandemic of COVID-19, African diseases or the Russia-Ukraine conflict, which may affect trends of digital transformation and ICT development as well as the global and regional economies. Therefore, these events should be considered when examining effects of factors on economic growth. Second, this research only analyzed the effects of ICT factors on economic growth, while in return, economic growth or income levels may affect ICT development in countries, as mentioned in the causality results. This means that there should be further studies that use advanced two-way vector analysis techniques to evaluate relationships between ICT and economic growth and even other factors. Third, it is suggested that the growth models should include more aspects of ICT such as ICT capital/investments or ICT human factors.

GREEN LOGISTICS IN LAST-MILE DELIVERY IN HANOI: AN APPROACH FROM THE CUSTOMERS' SIDE

Author: Le Nguyen Quynh Trang¹

Mentor: Assoc.Prof.PhD Trinh Thi Thu Huong², PhD. Nguyen Thi Yen²

ABSTRACT : "Green logistics" refers to logistical activities that minimize environmental problems. With the rise of e-commerce, the need for logistics services (shipping, packaging, etc.) is expanding, particularly in metropolises such as Hanoi and Ho Chi Minh City. As a result, logistical operations have a greater detrimental impact on the environment. Moving toward green logistics is the only approach to achieve the goal of sustainable development. Green logistics operations, on the other hand, need customers' acceptance in order to share the cost burden borne by LSPs when implementing green last-mile delivery. This study uses a multivariate analysis technique to assess the variables affecting customers' acceptance of green logistics in last-mile delivery in Ha Noi. The research result from 341 respondents shows that there are 04 factors positively affecting customers' acceptance, including (1) economic factors, (2) environmental concerns, (3) the usefulness of green logistics services and (4) knowledge of green logistics. Importantly, the effect of an economic factor on customer acceptance is by far the most significant. The study has also went into some currently effective policies and regulations of the Government and Hanoi People's Committee on green economic development and green logistics, as well as difficulties of Logistics service providers (LSPs) in controlling the aforementioned elements to achieve customers' acceptance. Therefore, implications for the state and LSPs have been proposed to strengthen customers' acceptance of green logistics in last-mile delivery field.

Keywords: Customers' acceptance, green logistics, last-mile delivery.

1. INTRODUCTION

Despite accounting for only 8.2% of Vietnam's population, Hanoi accounts for 30% of the country's e-commerce transaction value (VECOM, 2022). To support the growth of e-commerce, last-mile delivery in the city has witnessed a significant upward trend, accompanied by negative environmental impacts such as increased traffic congestion and accidents, air and noise pollution, and increased carbon emissions. Every day, a metropolis like Hanoi releases about 80 tons of plastic waste into the environment, but only a very small percentage of it is recycled (Vietnam Logistics Report, 2022).

In order to minimize these impacts, logistics service providers (LSPs) have implemented green logistics initiatives in last-mile delivery in many forms such as: delivering goods by electric vehicles, packing goods with biodegradable packages, delivering goods at centralized pick-up points, using smart lockers to deliver and collect items,... The aforementioned green logistics solutions all require certain investments that businesses call "green logistics costs". These costs can be paid by green logistics enterprises, or can be partly transferred to end users. However, in Vietnam, to the best of the author's knowledge, there is still no study to prove if customers truly accept the green services that firms provide. As a result, not all organizations can turn green logistics into their core competences.

With the aim of assessing the factors affecting the customers' acceptance of green logistics in last-mile delivery in Hanoi, thereby making some suggestions and recommendations for concerned parties, the author has used multivariate analysis technique. Sample survey was built and completed after collecting opinions from 6 customers (pilot test). After 26 days, the author received 341 valid responses for the research purposes.

2. THEORETICAL FRAMEWORK AND PROPOSED RESEARCH MODEL

2.1. Theoretical framework

2.1.1. *Green logistics model in last mile delivery*

Jazairy (2020) and Arkadiusz (2019) pointed out that green logistics in last-mile delivery included 5 aspects: (1) greening transportation, (2) greening packaging, (3) greening warehousing, (4) greening distribution and (5) reverse logistics.

❖ **Green transportation:**

Some basic criteria to evaluate the implementation of green transportation are green fuels used in transportation activities; efficiency in management of green transport routes; efficiency of means of transport; efficiency of the shipment arrangement.

❖ **Green packaging:**

Products with green packaging were created for the convenience and safe of products as well as the safe for human's health and safe for the living environment. Consumers choose green packaging in order to demonstrate their responsibility for the general survival of humankind.

Green packaging is also an opportunity for businesses to promote their business ethics as well as enhance their eco-friendly image in the eyes of customers.

❖ **Green warehousing:**

The term "green warehousing" refers to the energy utilized in the warehouse as well as environmentally friendly equipment. First of all, multifunctional software and robotics are used by businesses to manage and maintain warehousing processes.

Secondly, renewable energy may be defined as solar, geothermal, wind, biomass, hydroelectricity, and so on. In addition to this, reducing the amount of documentation employed in warehouse operations also helps to lessen the number of chopped-down trees, contributing to environmental protection.

❖ **Green distribution:**

Typically, distribution networks are designed to allow customers to receive/send goods at some easily accessible locations, such as newsstands, shopping malls, gas station, grocery store. Customers pay lower costs at these places compared to last-mile home delivery services; however, it does not enhance consumers' happiness owing to limited opening hours. Another solution to the problem of time delivery is a smart locker, where consumers can pick up and send items at any time of day or night.

❖ **Reverse logistics:**

The rate of product bounces in e-commerce is about 20-30%, doubling that figure of traditional retail (about more than 9%) (Pierce L, 2017). Goods purchased on E-commerce Exchange is often returned because it did not meet the buyer's expectations or had some functional mistakes. The policy of e-commerce platforms allows customers to return products without giving too specific reasons (Arkadiusz, 2019). This situation makes the process of reverse logistics very costly and emit a lot of CO₂ gases into the environment.

2.1.2. *Theoretical framework of customers' acceptance*

According to Schmidt (2017), "Customer acceptance describes the provisional consent, persuasion of the customers to buy, rent, or use a product, service, or a system of product - service. The acceptance can be quantified on a continuous (non-binary) scale¹ and depends on some aspects that increase or decrease the level of customer acceptance".

¹ Totally accept or totally refuse

It is necessary to distinguish “acceptance” of customers from some related concepts such as “satisfaction”, “perceived value”, “loyalty” and “preference” of customers. In it, “the satisfaction” is a term that seems very close to “acceptance”. However, the satisfaction is only considered after the customer consumes the good or service. Therefore, it ignores the factor of adoption or agreement of a new product or service (Schmidt, 2017), or factors that occur before customers use the product or service. Research on customer satisfaction can bring many benefits to businesses in terms of sales or profits, but focusing only on customer satisfaction will exert ignorance of factors affecting customers’ acceptance, especially when the business offers innovations or new products that customers never used before.

2.1.3. Theoretical framework of customers’ acceptance of green logistics in last-mile delivery

The research of Sajid *et al* (2021) indicated that customers accept green logistics through behaviors such as: (1) accepting to pay extra costs to get green logistics services; (2) accepting the use of green logistics services (green packaging, green means of transportation, centralized pick-up station, smart lockers, reverse logistics,...) even though there are inconvenience for them. Customers’ acceptance will ensure they have positive response to green logistics, thus reducing the risk of any negative impact on customer demand or satisfaction (e.g., customers have may not agree to pay more or agree to switch to green consumption behaviors).

The research of Brahme and Shafighi (2022) indicated that the customers’ acceptance of green logistics is reflected in the way they accept green methods of delivery.

2.2. Proposed research model

2.2.1. Proposed research model

After analyzing previous studies, the author synthesize the main factors that affect customers’ acceptance of green logistics as follows:

Table 1. Factors affecting customers’ acceptance of green logistics

No.	Factors	References
1	Economic factors	Sajid et al. (2021); Wang et al. (2019)
2	Environmental concerns	Sajid et al. (2021); Zhang et al. (2018); Koshta et al. (2022)
3	Understanding of green logistics	Brahme & Shafighi (2022)
4	Perception of the usefulness of green logistics services	Brahme & Shafighi (2022); Kaoy et al. (2020); Khan et al. (2019)
5	Subjective norms	Sajid et al. (2021); Koshta et al. (2022)

Source: The compilation of the author

The research model with research hypotheses is as follows:

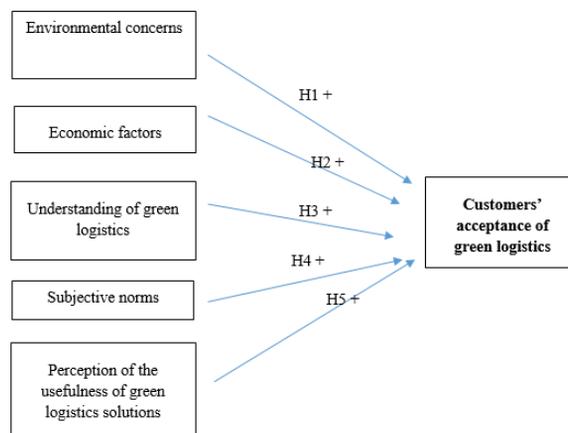

Figure 1. Proposed resreach model

Source: Proposed by the author

2.2.2. Research hypotheses

❖ Environmental concerns

Environmental concerns are one's concerns about air quality, quality of soil, water resources, ... and harmful impacts of humans' activities on the environment as well as their attitudes towards solutions to improve environmental issues (Hopwood et al., 2005; Schuitema et al., 2013).

The study of Nnorom et al. (2009) provided evidence of a direct influence of environmental concerns on consumers' intention to recycle products. For the willingness to pay for green services, Wei et al (2018) suggested that people who lack environmental concerns are less likely to pay for green services. Similarly, Konuk (2018) indicated that people with a strong interest in environmental issues will happy to pay a higher price for green products/services. Research hypothesis

The research hypothesis is given as follows:

H1: Environmental concerns have a positive impact on customers' acceptance of green logistics

❖ Economic factors

Economic factors consider the income level of customers and their evaluation of whether green logistics solution worth paying the higher price? The research hypothesis is given as follows:

H2: Economic factors have a positive impact on customers' acceptance of green logistics

❖ Understanding of green logistics

Understanding green logistics is the information and facts that a person has about green logistics through learning, hearing or experiencing. It can be knowledge of the regulations or about the green logistics model.

The research hypothesis is given as follows:

H3: Understanding green logistics has a positive impact on customers' acceptance of green logistics

❖ Usefulness of green logistics services

The perception of usefulness of green logistics services will consider the convenience, ease of use , safety of green logistics services, and customer reviews of whether or not these green solutions help them.

The research hypothesis is given as follows:

H4: The usefulness of green logistics services has a positive impact on customers' acceptance of green logistics.

❖ Subjective norms

Subjective norms are understood as the social pressure placed on an individual when he or she exhibits a specific behavior (Ajzen & Fishbein, 1980). Subjective norms reflect perceptions of an individual about the attitudes of others (people who are important to him or her) for green logistics, while compliance motivation motivates individuals to listen to opinions of people who are important to us about adopting or not adopting green logistics (Sajid et al., 2021).

The research hypothesis is given as follows:

H5: Subjective norms have a positive impact on customers' acceptance of green logistics.

3. RESEARCH METHOD

3.1. Development of questionnaires and research scales

The author has developed a questionnaire, then surveyed 06 customers who used last-mile delivery services (table 3.1). The official questionnaire is conducted from 16th November to 11th December, 2022. The author use a 5-point Likert scale to measure observed variables. Other classification variables such

as: gender, age, income, frequency of online purchases, and understanding of green logistics services are measured using nominal scales, which depend on the form of data reflecting them.

Table 2. Questionnaire

CODE	Description	References
MT	Environmental concerns	
MT1	I'm someone who cares about environmental issues	Sajid & et al. (2021), Zhang & et al. (2018); Hao & et al. (2019), Wang & et al. (2019); Koshta & et al. (2022)
MT2	I'm worried that plastic waste, electronic waste will harm the environment	
MT3	I'm worried that vehicles that do not meet emission standards will pollute the environment	
MT4	I think environmental problems (air pollution, noise pollution, water pollution, excessive use of fossil fuels such as gasoline, oil, etc.) will negatively affect my health	
KT	Economic factors	
KT1	I believe that the pricing of green logistics services is in line with the benefits it brings to us	Proposed by the author
KT2	My income allows me to spend more on using green logistics services	Hao & et al. (2019); Sajid & et al. (2021)
KT3	To develop green logistics, I think businesses can charge more fees	
HB	Understanding of green logistics	
HB1	I know that green logistics includes: Green transportation, green packaging, green energy, and green distribution	Brahme & Shafighi, (2022)
HB2	I know that green logistics uses green transport vehicles (electric vehicles, low-emission engines, E5 biogasoline vehicles, ...) to reduce noise, carbon emissions, and environmental emissions	
HB3	I know that green logistics uses green packaging (recycled/reusable packaging, biodegradable packaging, ...) to limit the harmful effects of plastic waste on the environment	Sajid & et al. (2021)
HB4	I know that green logistics uses centralized pick-up points, smart lockers to reduce the burden of delivery, reduce traffic congestion and carbon emissions	Proposed by the author
HB5	I know that green logistics encourages consumers to return e-waste to limit the negative impact of this type of waste on land and water sources	Sajid & et al. (2021)
HB6	I know that the Government already has regulations to encourage green logistics	Brahme & Shafighi (2022)
HU	Usefulness of green logistics services	
HU1	Green logistics services (smart lockers, centralized pickup points, Click&Collect) allow me to be flexible in terms of receiving time	Klein & et al. (2018) và Sajid & et al. (2021)
HU2	Green logistics system is arranged in convenient locations for me to use (There are centralized pick-up points, smart lockers, electronic waste collection points, ... near where I live/work)	
HU3	The quality of goods delivered through the green logistics system (packed in green packaging, delivered by green means of transport such as electric vehicles, delivered at lockers, delivered at centralized pick-up points, ...) met my expectations	
HU4	Recycled/eco-friendly packaging allows me to use it repeatedly for different purposes	
QC	Subjective norms	
QC1	The community where I live helps me understand green logistics	Sajid & et al. (2021); Zhang & et al. (2018); Wang & et al. (2019); Koshta & et al. (2022)
QC2	People around me embracing green logistics services	
QC3	If my friends use green logistics services, I will do the same	Proposed by the author
QC4	If I don't accept green logistics services, I will be seen as backward and unconcerned about the environment	
CN	Customers' acceptance of green logistics	
CN1	Since I am the ultimate beneficiary of green logistics services, I agree to pay more for green logistics services (green packaging, green transport, reverse logistics for defective product recovery, ...)	Sajid & et al. (2021); Brahme& Shafighi (2022)
CN2	I will pick up the goods at smart lockers, public pickup points	
CN3	If there are recycling instructions on the package, I will take the time to dispose of the packaging according to the instructions	
CN4	I will return defective products, electronic waste (television, phone,...) at collection points / according to the collection campaign	
CN5	I support businesses to include green logistics in their development strategies	

Source: Proposed by the author

3.2. Study sample size and data collection methods

The population of this study is defined as customers in Hanoi who have used the last mile delivery service. However, it is not possible to determine the size and approach of the whole population. Therefore, the author applied a convenience sampling technique.

In the world, there are many disagreed views on the sample size to ensure credibility reliance of research. Tabachnick and Fidell (2006) came up with a formula for determining sample size, which is $n \geq 8m + 50$ (n is the sample size, m is the number of independent variables in the research model). Some other researchers gave a sample size according to the rule of multiplication 5 (Bollen, 1989), i.e. 5 times the number of variables will produce a minimum sample size that ensures the reliability of the study. In this research, the author determined the sample size to be 300, satisfying Tabachnick and Fitell's (2006) rule ($8*5+50 = 90 < 300$), while also satisfying the multiplication rule ($26*5 = 130 < 300$).

The author collected the data using an online survey. Questionnaire was sent to students of Foreign Trade University, Hanoi University of Science and Technology, Hanoi Medical University,...; Vietinbank Nam Thang Long branch; Technical Center Viettel Hoa Lac,... At the same time, the inhabitants in the neighborhood and acquaintances of the author are also a reliable source of data.

After 26 days, the authors received 341 valid responses. Survey data is processed using the Excel and SPSS 20 programe (Statistical Package for the Social Sciences) version 20.

4. RESULTS AND DISCUSSION

4.1. Results

4.1.1. Demographics of respondents

Table 3. Demographics of respondents

Traits	Number	Percentage
Sex		
Female	196	57,48%
Male	145	42,52%
Age		
18 - 25	118	34,60%
26 - 35	94	27,57%
36 – 45	97	28,45%
45 tuổi	32	9,38%
Monthly income		
Under 3 million dongs	59	17,30%
3 - under 7 million dongs	97	28,45%
7 – under 15 million dongs	88	25,80%
15 - under 30 million dongs	81	23,75%
Over 30 million dongs	16	4,7%

Source: Data processing results using SPSS 20 software

Of the 341 valid responses, in terms of gender, the number of female customers accounted for 57.48%. The highest age concentration was in the 18-25 age group, with 118 votes (34.60%). People at the age of over 45 accounted for 9,38%. When it comes to monthly income level, the most popular surveyed response is from 3 to less than 7 million VND, accounting for 28.45%.

Table 4. The frequency of online shopping of customers

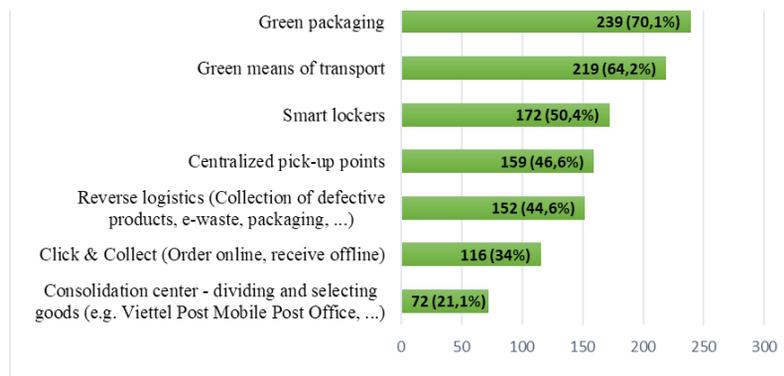

Frequency of online shopping	Number	Percentage
More than 1 time/week	35	10,26%
1 time/week	132	38,71%
1 time/month	95	27,86%
1 time/quarter	54	15,84%
1 time/year	9	2,64%
Rarely	16	4,69%

Source: Data processing results using SPSS 20 software

4.1.2. Results on the status of customer's acceptance of green logistics in last-mile delivery

The author conducted a survey on the percentage of customers who know about the above green delivery solutions provided by logistics service providers. The survey results are shown in Figure 2.

Figure 2. Percentage of customers who know about the green delivery solutions

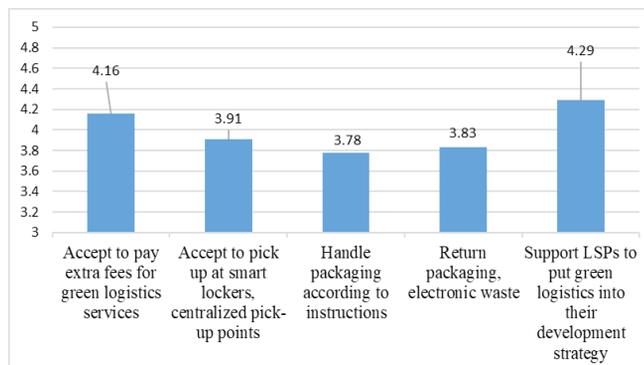

Source: Author's survey

According to the study results, green last mile delivery solutions are accessible to clients in Hanoi. Green packaging is the most well-known solution among clients, with 70.1% opting for it. Green transportation comes in second with 64.2%. Customers have also shown a strong interest in cutting-edge solutions such as smart lockers and centralized pick-up points. 44.6% of consumers are aware of the reverse logistics of collecting electronic garbage. Only the consolidation center - division of items is oriented towards the supply side of last-mile delivery process, thus it has the fewest customers (with only 21.1%).

Following that, the author conducted a survey on the types of green logistics acceptability in customer last mile delivery, receiving the findings given in figure 3 below:

Figure 3. Customers' acceptance of green logistics in last-mile delivery

Source: Author's survey

The most acceptable kind of customers' acceptance (with 4.29 out of 5 points) is supporting LSPs to put green logistics into their development plan. The acceptance of additional payments for green logistics services (4.16 points) comes next. However, when it comes to more specific actions that require more time and effort, such as receiving goods in a public place, recycling and reusing packaging, or returning e-waste, etc., this number tends to decrease, particularly in terms of handling packaging according to instructions, which only received 3.78 points.

4.1.3. Cronbach's Alpha Analysis

All observed variables are eligible to be included in EFA analysis because the variable-total correlation coefficient is greater than 0.3 and Cronbach's Alpha value is greater than 0.6. The results of Cronbach's Alpha analysis are shown in Table 5.

Table 5. Cronbach's Alpha Analysis

Independent Variable	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
Environmental concerns (Cronbach's Alpha = 0,778)		
MT1	0,555	0,745
MT2	0,565	0,733
MT3	0,708	0,665
MT4	0,527	0,753
Economic factors (Cronbach's Alpha = 0,779)		
KT1	0,563	0,756
KT2	0,682	0,628
KT3	0,610	0,711
Understanding of green logistics (Cronbach's Alpha = 0,901)		
HB1	0,779	0,875
HB2	0,768	0,877
HB3	0,717	0,885
HB4	0,710	0,887
HB5	0,872	0,865
HB6	0,570	0,907
Usefulness of green logistics services (Cronbach's Alpha = 0,804)		
HU1	0,722	0,703
HU2	0,569	0,777
HU3	0,555	0,783
HU4	0,637	0,747
Subjective norms (Cronbach's Alpha = 0,754)		
QC1	0,536	0,705
QC2	0,492	0,730
QC3	0,595	0,672
QC4	0,585	0,680
Dependent Variable	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
Customers' acceptance of green logistics (Cronbach's Alpha = 0,821)		
CN1	0,640	0,780
CN2	0,662	0,770

4.1.4. Exploratory Factor Analysis

Table 6. EFA for the independent variable

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0,858
Bartlett's Test of Sphericity	Approx. Chi Square	3906,582
	df	210
	Sig.	0,000
Eigenvalue		1,163
Cumulative of Variance		67,381%

Source: Data processing results using SPSS 20 software

At the end of the KMO and Barlett tests, the measured KMO value is 0.858, ranging from 0.5 to 1. This proves that factor analysis is appropriate. At the same time, the sig value. is less than 0.05, proving that the Barlett test is statistically significant or the observed variables are correlated in the population. With the Principal Component extraction method and Varimax rotation, there are 5 factors extracted with the total extracted variance (the total variation explained by the factors) of 67.381% (greater than 50%), this means 67,381% variability of the data is explained by 5 factors. In addition, the Eigenvalues of the factors are all greater than 1 (the smallest is 1.163), so all 5 factors are kept in the analytical model and the conclusion that using the factor analysis method is perfect fit.

Table 7. Rotated Component Matrix

	Component				
	1	2	3	4	5
HB5	0,878				
HB1	0,837

4.1.5. Pearson Correlation

Next, the author conducted Pearson correlation analysis to evaluate whether there is a correlation between the independent variables and the dependent variable or between the independent variables. The results of the correlation analysis are shown in Table 9.

Table 9. Pearson Correlation

		CN	MT	KT	HB	HU	QC
CN	Pearson Correlation	1	0,601**	0,677**	0,507**	0,616**	0,420**
	Sig. (2-tailed)		0,000	0,000	0,000	0,000	0,000
	N	341	341	341	341	341	341
MT	Pearson Correlation	0,601**	1	0,433**	0,461**	0,409**	0,307**
	Sig. (2-tailed)	0,000		0,000	0,000	0,000	0,000
KT	Pearson Correlation	0,677**	0,433**	1	0,403**	0,585**	0,383**
	Sig. (2-tailed)	0,000	0,000		0,000	0,000	0,000
HB	Pearson Correlation	0,507**	0,461**	0,403**	1	0,473**	0,438**
	Sig. (2-tailed)	0,000	0,000	0,000		0,000	0,000
HU	Pearson Correlation	0,616**	0,409**	0,585**	0,473**	1	0,447**

QC	Pearson Correlation	0,420**	0,307**	0,383**	0,438**	0,447**	1
	Sig. (2-tailed)	0,000	0,000	0,000	0,000	0,000	

Source: Data processing results using SPSS 20 software

4.1.6. Regression Analysis

Finally, the author proceeded to build a linear regression model to find out the relationship between the independent variables and the dependent variable. The dependent variable built in the model is “Customers’ acceptance of green logistics” (CN) and 5 independent variables are “Environmental concerns” (MT), “Economic factors” (KT), “Understanding of green logistics” (HB), “Usefulness of green logistics services” (HU) and “Subjective norms” (QC).

Table 10. Regression Analysis

R ²		0,627					
Adjusted R ²		0,622					
Std. Error		0,3493170					
Durbin - Watson		1,925					
Sig. (F-Test)		0,000					
Predictor	Unstandardized Coefficients		Standardized Coefficients		t	Sig.	VIF
	β	Sts. Error	β				
(Constant)	0,348	0,164			2,117	0,035	
MT	0,282	0,038	0,294		7,385	0,000	1,421
KT	0,308	0,036	0,366		8,495	0,000	1,669

HB	0,086	0,035	0,102	2,456	0,015	1,557
HU	0,177	0,038	0,211	4,716	0,000	1,794
QC	0,043	0,033	0,051	1,290	0,198	1,386

Source: Data processing results using SPSS 20 software

With adjusted R2 reaching 0.622 (62.2%) means 5 independent variables Environmental concerns; Economical factors; Understanding of green logistics; Usefulness of green logistics services; and Subjective norms explain 62.2% of the change in the dependent variable Customers’ acceptance of green logistics. The remaining 37.8% is explained by random error and other variables that have not been included in the model.

In this model, a Durbin – Watson value $d = 1.925$; for $k' = 5$ and $n = 341$, then $dU = 1,854$. Considering that: $dU = 1.854 < 1,925 < 4 - dU = 2.146$; therefore, no first-order autocorrelation occurs in the research model.

In addition, the significance level sig. (F-test) is 0.000 (lower than 0.05), proving that the linear regression model proposed by the author can be generalized and applied to the population. Finally, the variance exaggeration coefficient VIF of all dependent variables is less than 2, indicating that the model does not have multicollinearity.

Table 11. Research hypothesis test results

Hypothesis	Content	Standardized Coefficients	Sig.	Result
H1	Environmental concerns have a positive impact on customers’ acceptance of green logistics	0,294	0,000	Accepted
H2	Economics factors have a positive impact on customers’ acceptance of green logistics	0,366	0,000	Accepted
H3	Understanding of green logistics have a positive impact on customers’ acceptance of green logistics	0,102	0,015	Accepted
H4	The usefulness of green logistics solutions have a positive impact on customers’ acceptance of green logistics	0,211	0,000	Accepted
H5	Subjective norms have a positive impact on customers’ acceptance of green logistics	0,051	0,198	Rejected

Source: Author

The standardized coefficients of the variables MT, KT, HB, HU all have sig significance. is less than 0.05, and these standardized regression coefficients all have (+) sign, proving that 4 variables MT, KT, HB, HU have a positive impact on the dependent variable, which is the acceptance of green logistics by customers. row. The variable QC has a significance level of the standardized regression coefficient of 0.198 (>0.05), showing that this variable has no impact on the dependent variable.

With the results of the above regression analysis, the linear regression model of the research will be written as follows:

$$CN = 0,294*MT + 0,366*KT + 0,102*HB + 0,211*HU$$

4.2. Discussion

The findings of regression model testing reveal that environmental concerns, economic factor, understanding of green logistics, and the usefulness of green logistics services all have a positive influence on customers’s acceptance of green logistics in last-mile delivery.

Customers’ acceptance of green logistics is mostly influenced by economic factors. This is explained by the fact that customers will question whether the green solutions that businesses provide are truly worth the extra money that they have to pay, because in many cases, “green label” is just an excuse for businesses to collect additional service fees, but the true value the business brings to the environment and consumers is not considerable.

5. RECOMMENDATION

The general recommendations for the Government as well as logistics service providers can be formulated based on quantitative and qualitative bases as follow:

01. Based on the research results, several solutions can be proposed to promote the customers' acceptance of green logistics through affecting 4 factors: (i) Economic factors, (ii) Environmental concerns, (iii) Understanding of green logistics and (iv) The usefulness of green logistics services.

02. General regulations and policies of the Government and Hanoi People's Committee related to green economic development and green logistics should be studied to evaluate the strengths and opportunities of green logistics activities.

03. Some difficulty in controlling the factors affecting the customers' acceptance of green logistics should also be not overlooked to make some feasible recommendations for both state management agency and logistics service providers.

5.1. General regulations and policies of the Government and Hanoi People's Committee on green economic development and green logistics

Most recently, at the 26th Conference of the Parties to the United Nations Framework Convention on Climate Change (COP 26), Vietnam pledged to develop and implement measures to reduce greenhouse gas emissions, strong, reaching net emissions of "zero" by 2050 and reducing methane emissions by 30% by 2030. Accordingly, the Prime Minister signed Decision No. 2157/QĐ-TTg on December 21, 2021 and approved the Circular Economy Development Project on June 7, 2022 to implement and implement this commitment of Vietnam.

On July 22, 2020, the City People's Committee also issued the plan 149/KH-UBND on Green Growth Actions in Hanoi until 2025, with orientation to 2030. The main purpose of this plan is to implement the general direction of the Party and the State on sustainable development, green growth, green urban development and implementation of Vietnam's commitments with international friends related to greenhouse gas emissions issues.

As can be seen, the Government and Hanoi People's Committee have released several legislative papers and regulations concerning green economic growth, including green logistics development. This demonstrates the Party's, Government's, and especially the Capital's concern for green economic development; at the same time, it depicts the Party's, Government's, and functional agencies' determination to create a favorable legal corridor for the sustainable development of the economy in general and the development of green logistics activities.

5.2. Difficulty in controlling the factors affecting the customers' acceptance of green logistics

❖ Reasons from state management agencies

Firstly, lack of financial support policies for businesses implementing green logistics:

Current regulations or policies of the state management agencies about green logistics development are lack of financial support policies, such as: tax exemption, supporting the cost of renting warehouse space, smart lockers, etc. This will lead to the limitations related to green logistics operation costs of businesses, forcing them to raise the price of green logistics services and affecting economics factors – the most important factor affecting customers' acceptance.

Secondly, lack of binding regulations and independent organization to inspect and supervise green logistics activities of businesses:

Up to now, Hanoi only has a green urban development policy, not yet any specific policy related to green logistics development and green logistics in last-mile delivery. These specific policies namely: allowing the installation of public smart lockers; guiding and organizing collection campaign for electronic waste, etc. Furthermore, Hanoi lacks standardized criterias for determining the extent of the businesses' implementation of green logistics. In fact, there is no independent organization to inspect and supervise green logistics activities of businesses.

Thirdly, lack of communication coordination of management agencies and associations related to green logistics services to consumers:

It can be noticeable that there is no cooperation between state management authorities and business groups such as the logistics service providers and the E-commerce Association on the development of green logistics and its environmental advantages. As a result, customers lack a complete grasp of green logistics and have yet to comprehend its benefits, making it not widely accepted.

❖ Reasons from LSPs

Firstly, the size and financial capacity of the businesses are not strong, so they has to transferred the financial burden of green logistics costs to customers.

Secondly, green last mile delivery solutions don't really make much sense to customers: Overall, the usefulness and convenience of green last mile delivery solutions does not really mean much to customers compared to traditional last-mile delivery. Pick-up operations at smart lockers or phases of returning damaged items, rubbish gadgets, etc. are still somewhat difficult. As discussed in the limitations section, clients have yet to determine if the cost of green logistics services is worth the value they provide, therefore they will hesitate before adopting.

Table 12. Difficulty in controlling the factors affecting the customers' acceptance of green logistics

Reasons from state management agencies	Reasons from LSPs
Lack of financial support policies for businesses implementing green logistics	The size and financial capacity of the business is not strong →
Lack of binding regulations and independent organization to inspect and supervise green logistics activities of businesses	Has to transferred the financial burden of green logistics costs to customers
Lack of communication coordination of management agencies and associations related to green logistics services to consumers	Green last mile delivery solutions don't really make much sense to customers

Source: Author

5.3. Recommendation

5.3.1. Solutions for logistics service providers

❖ Solutions related to economic factors

Because economic factors have the greatest influence on consumers' acceptance of green logistics, the solutions provided should be aimed at lowering the cost of green logistics services.

Firstly, while the use of green packaging or green transportation may increase operational costs of businesses, leveraging technological advancements such as vehicle routing system can help businesses reduce transportation costs. In addition to this, taking advantage of recycled and reused materials, businesses can completely reduce input costs, therefore, making the price of green logistics services affordable for customers.

Secondly, the cost of green logistics services can be reduced if businesses agree to transfer a portion of corporate profits or government financial support to subsidize customer prices, thereby increasing the acceptance of green logistics and attracting more potential customers.

Thirdly, businesses should have procedures to encourage customers to return packaging, defective items, e-waste, ... through incentives such as discounts, coupons and free products for future orders.

❖ **Solutions related to environmental concerns and understanding of green logistics**

Firstly, propaganda and advertising about the enterprise's green logistics strategy should be put into practice in order to increase consumers' comprehension of green logistics as well as publicly promote the business's environmentally friendly image. Propaganda and advertising can take the form of posters, standees at smart lockers, centralized pick up points, or even delivery vehicles themselves.

Secondly, in order to solve the problem of centralized pick-up points, logistics companies can collaborate with other retail businesses (such as Winmart, Circle K, etc.) to promote cross-green images of each other.

Thirdly, the employment of key opinion leaders (KOLs), celebrities as brand ambassadors is the quickest way to propagate company's green image to customers.

❖ **Solutions related to the usefulness of green logistics services**

The usefulness of green logistics service determines whether customers accept it or not. Therefore, last-mile delivery businesses need some measures to improve the quality of their green services.

Firstly, for green transport activities, businesses need to improve the quality of their fleet existing delivery vehicles, there are plans to equip electric vehicles in the future. In addition, businesses should also increase the application of technology in transportation route management in order to minimize the cost and time of delivery and avoid the status of empty return-side.

Secondly, in order to implement green distribution solutions such as smart lockers and centralized receiving points, businesses must first extend their network of lockers and pick-up points. Only when the density of lockers and centralized pick-up points is dense enough will it completely create the convenience of location and delivery time while also fully meet the expectations of consumers. Furthermore, lockers should be put in secure areas with security cameras so that clients may be confident in picking up products at various times, even when it is dark or in the evening.

Another thing is worth highlighting is that companies who provide lockers or centralized pick-up points for last-mile delivery must maintain the consignee's information strictly secret in order to avoid the situation of leaking customers' information. Finally, the operation of the locker should be simplified so that senior consumers may utilize it as well.

Thirdly, in addition to the economic solutions outlined above, the collecting systems of electronic waste, packaging, and faulty items must be enlarged and put in customers' convenient places. Alternatively, it is conceivable to combine the collection and exchange of faulty items using smart lockers provided by businesses to diversify services and increase consumer convenience.

Fourthly, current packaging of delivered goods, even when constructed from ecologically friendly materials, is packed very securely and sealed with many sticky tapes, making it nearly impossible for customers to reuse the packing after removing the items. As a result, firms should do research on the type or manner of packing so that the packaging remains eco-friendly and reusable after receiving the goods.

5.3.2. Recommendation for state management agencies and related associations

❖ **Building a synchronous legal corridor for green logistics activities**

The government must continue to develop the synchronized legal framework for green logistics activity. In particular, for green transportation, cars that do not satisfy pollution and noise regulations should

not be allowed on the road. Furthermore, in the early phases, incentives should be provided for licenses of green means of transportation. Secondly, there should be standards on the type and the manner of green packaging. More detailed restrictions on rubbish, green waste, and e-waste for manufacturing, business, and commercial enterprises are required for the implementation of reverse logistics.

Without a tight regulatory framework, businesses would frequently prioritize their profit maximization rather than environmentally beneficial.

❖ Establishing an independent inspection organization and the measurement for the development of green logistics

The government must establish an independent inspection organization to verify, monitor, and assess the operations of firms adopting green logistics. This organization's evaluation will ensure that the logistics company's information and statistics regarding green logistics activities are transparent and accurate, so that the interests of consumers are protected.

The Vietnam Logistics Report 2022 also recommended us to use a set of criteria called "green logistics performance index" to evaluate the effectiveness and development of green logistics operations at businesses. (Ministry of Industry and Trade, 2022).

❖ Establishing policies that pave the way for businesses to develop green logistics

The Government and the Hanoi People's Committee should develop more specific policies and regulations to encourage and promote enterprises to develop green logistics through financial support (tax reduce, preferential loan policies, etc.); encourage businesses to use green modes of transportation; encourage the use of green energy in warehousing operations, encouraging green packaging and reverse logistics management. In contrast, logistics companies that harm the environment should face harsh penalties.

❖ Raising awareness of the whole society about green logistics

State management agencies and related associations (Association of Logistics service providers, Logistics Human Resource Development Association, E-commerce Association) need to propagate and educate widely, raising society's awareness of environmental issues and green logistics in general, green logistics in last mile delivery in particular, for consumers to understand, trust and strongly accept to use more green logistics services.

❖ Planning and investing in the development of road transport infrastructure

The government and Hanoi People's Committee must consider designing and constructing a smart city concept. Road transportation infrastructure for last-mile delivery should be modernized, generating ideal circumstances for green transportation. Difficult challenges, such as traffic congestion, poor road surface quality, and flooding during the rainy season, must all be evaluated and addressed, because these issues are the direct root causes of increased logistical costs and time.

6. CONCLUSION

Based on the identification of four factors affecting customers' acceptance of green logistics in last mile delivery, as well as the favorable regulations and difficulties in controlling the four factors mentioned above, the study has proposed solutions for businesses and recommendations for state management agencies to develop green logistics in Hanoi.

According to the findings, economic factors have the biggest impact on customers' acceptance, whereas subjective norms are not relevant within the local scope research of Hanoi.

The immediate development or application of green logistics may trigger increased costs and reduced profits for the business; however, if the business and related parties do not immediately get involved, the impact on the environment will be very severe, and our future generations will spend a lot of money to restore a clean living environment. The best option will be a mixed strategy (a combination of top-down and bottom-up strategies) to establish green logistics. In more detail, the government enforces required restrictions (from the top down) for enterprises to comply with. Businesses and consumers must also actively participate in its implementation (from the bottom up).

The study is currently limited in terms of sample size, but the quantitative research findings will be useful for other geographical locations as well.

EXPORT TRENDS OF MINERAL PRODUCTS IN GREEN ECONOMY DEVELOPMENT IN VIETNAM

Author: Truong Quang Bao¹, Hoang Dang Thu Hien², Pham Thi Thao Linh², Lam Thi Xuan Mai²

ABSTRACT : In order to conduct the research, a quantitative research method was used, which relied on secondary sources of information collected from various sources covering the period from 2000 to 2021. This approach allowed for the analysis of data that had already been gathered and provided a comprehensive historical perspective. Panel data was utilized to estimate and build three models, namely the Pooled OLS model, fixed effects model (FEM), and random effects model (REM). By selecting the most appropriate model, the study was able to achieve an accurate and reliable analysis of the data, enhancing the validity of the findings. The results of this analysis revealed that the Minerals Law 2010 had an opposite result than expected, with a positive impact on Vietnam's mineral exports rather than a negative one. Interestingly, the degree of free trade of the importing country did not have any impact on Vietnam's mineral exports to that country. However, the GDP factor of the importing country, the world mineral price, and the Minerals Law 2010 were found to have a positive impact on Vietnam's mineral exports. This suggests that economic conditions play a crucial role in determining trade flows. On the other hand, factors such as the geographical distance between Vietnam and the importing country and the Law on Environmental Protection 2014 harmed Vietnam's mineral exports.

Keywords: green economy; mineral exports; Vietnam

1. INTRODUCTION

1.1. Urgency of the topic

Mining has been a vital industry in Vietnam, contributing significantly to the country's economic growth and development. The industry has generated income, provided employment opportunities, and produced essential raw materials for manufacturing various goods. The mining industry is known to consume vast amounts of energy and natural resources, leading to significant greenhouse gas emissions and reduced resource availability. Moreover, mining activities have caused negative impacts on the environment, including land degradation, deforestation, and biodiversity loss. These factors have necessitated regulatory interventions by the Vietnamese government to reduce these adverse effects.

To address these concerns, the Vietnamese government has implemented several policies and regulations in recent years aimed at promoting sustainable and efficient resource exploitation while protecting the environment. For example, the government enacted the Mineral Law 2010 and the Environmental Protection Law 2014, which sets forth specific requirements and standards for responsible mining practices. In addition, the government has issued other relevant policies focusing on sustainable development, such as Sustainable Development Strategy for 2011-2020, and Green Growth Strategy for 2011-2020, and Vision for 2050.

Previous studies on mineral commodities have mainly focused on addressing technical issues and economic efficiency, rather than considering the global and regional economic context of the "greening" trend. Therefore, our research group conducted a study on "Trends in Exporting Mineral Commodities for the Development of Vietnam's Green Economy," which delved deeper into various influencing factors, including the Mineral Law 2010, the Environmental Protection Law 2014, and Vietnam's CO₂ emissions. The study highlights the importance of promoting sustainable and efficient resource exploitation in Vietnam's mining industry, especially regarding environmental protection.

1.2. Research Purposes and Objectives

The goal of this analysis is to examine the factors affecting Vietnam's mineral exports using the gravity model combined with three main input variables: the Mineral Law 2010, the Environmental Protection Law 2014, and CO2 emissions. In this model, the Mineral Law and the Environmental Protection Law are used as control variables, multiplied by the number of CO2 emissions. The gravity model allows us to estimate the quantity of goods exported from Vietnam to other countries over a given period. From the gravity model, we can analyze Vietnam's mineral export situation in the green growth strategy when applying the Mineral Law 2010, and the Environmental Protection Law 2014 combined with CO2 emissions. These factors may limit mining and production activities, increase production costs, and reduce Vietnam's competitiveness in the international market.

2. LITERATURE REVIEW, THEORETICAL FRAMEWORK, AND METHODS

2.1. Literature review

2.1.1. Foreign Research

Dr. Syed Akhtar Hussain Shah's (2018) study "Strategy for Mineral Sector Development in Pakistan" provides insights into the significance of the mineral sector for the economic development of developed countries such as China, Italy, Turkey, Spain, Brazil, and so on. This research emphasizes the need for effective resource policymaking, comprehensive planning, and coordination between stakeholders to achieve sustainable mineral sector development. Similarly, Józef Dubiński's (2013) study "Sustainable Development of Mining Mineral Resources" highlights the importance of mineral resources in the global economy and a country's economic development. Laura Hering and Sandra Poncet's 2014 research examines the impact of domestic environmental regulations on export behavior in China. They found that stricter policies, such as the TCZ (targeting SO2 emissions reduction in highly polluted cities and regions), have a greater negative impact on exports as activity pollution levels increase. Several studies have applied gravity models to analyze the exports of different countries, including South Korea, Iceland, China, Nicaragua, Cameroon, and Pakistan. The results of these studies indicate that GDP per capita, geographical distance, and participation in trade agreements are significant determinants of a country's export volume. Exchange rate fluctuations also play a crucial role in international trade, as demonstrated by Jana Šimáková and Daniel Staváre's (2015) study of Hungary. Their research found that bilateral exchange rate fluctuations had a negative impact on Hungary's international trade, leading to a decline in trade volume. This highlights the importance of exchange rate stability for maintaining healthy trade relations between countries.

2.1.2. Domestic Research

Researchers, such as Do Tri Thai and Bac Xuan Nguyen, have applied the model to explain Vietnam's trading activity with European countries and its export value over a period of 20 years, respectively. The models consider several traditional variables, including GDP, exchange rates, distance, currency depreciation, the income of trading partners, and Vietnam's GDP, to determine their effect on trade flows. According to the studies conducted by Võ Thy Trang and Tran Thanh Long, it has been observed that countries prefer trading with those that have higher economic openness rather than high trade barriers. Additionally, Bui Thi Hong Hanh and Quitting Chen's research on rice exports highlights the impact of the population of the exporting country and export price on Vietnam's rice exports. Furthermore, Lai Van Manh and Nguyen Thang's study demonstrates how resource taxes affect coal exports from Vietnam to significant markets, their research on the mining sector of Vietnam not only reveals the adverse effect of increased resource taxes on coal exports but also sheds light on the underlying causes. The increase in taxes has led to an increase in prices, making Vietnamese coal less competitive in global markets. In addition, the study provides a detailed analysis of the impact of administrative order 02 on mineral ore exports from Vietnam. The issuance of the administrative order has significantly reduced the number of mineral ore exports from Vietnam due to the increased state

management of exploration, exploitation, processing, use, and export of mineral resources. Furthermore, the study suggests that this variable could have long-term implications for the entire mining sector's exports, as it highlights the importance of government policies and regulations in shaping the mining industry in Vietnam.

2.2. Theoretical framework

2.2.1. The concepts

A green economy, as defined by the United Nations Environment Programme, is one that is low in carbon, resource efficient, and socially inclusive. A green economy is required because it produces employment, assures long-term economic growth, and lowers pollution, global warming, resource depletion, and environmental degradation.

Exports are crucial for boosting the overall economy and creating new markets. Vietnam is a nation rich in minerals and natural resources, hence mineral exports are crucial to creating export flows that create foreign currency for the economy. The gravity model is a frequently employed model to interpret observable commercial constructions. Bilateral commerce is the fundamental tenet of the gravitation model, and it is influenced by two variables: the distance between two countries and the size of their economies (as measured by GDP). The formula for Tinbergen's 1962 simple gravity model is as follows:

$$F_{AB} = \frac{M_A \times M_B}{D_{AB}}$$

- F_{AB} is the value of goods exported from country A to country B.
- M_A, M_B is the size of the economies of countries A and B as measured by GDP.
- D_{AB} is the geographical distance between two countries is considered, representing the cost of shipping and the time it takes to deliver the goods.
- M_A, M_B is the size of the respective economies of countries A and B, usually measured in GDP.
- D_{AB} is the geographical distance between two nations is taken into consideration when calculating the cost of shipping and the delivery time for the goods.

In terms of benefits, the gravity model is one of the most well-studied in the field of international economics. According to Estrella Gómez-Herrera (2013), the logarithmic linearization of gravity models has at least two errors. The first is noted by Anderson and van Wincoop (2003) and unrecognized heterogeneity in the commercial data leads to biased estimates due to wrong selection. Second, it is not possible to calculate the logarithm of zero according to Estrella Gómez-Herrera (2013)

2.2.2. Hypotheses and Research Model

Hypothesis 1: Vietnam's mineral exports to the importing nation are positively impacted by that nation's gross domestic product.

The GDP of the importing country has a favorable impact on the consumption of goods and the number of trade goods, according to Pham Kieu Phuong, Le Ngoc Bao Tran (2022), Prasad (2000), M. Faruk Aydin (2004), Usman Haleem et al (2005), Safdari Mehdi and Motiee Reza (2011), and MD. Moniruzzaman (2011). Consequently, it is reasonable to believe that there is a strong connection between them.

Hypothesis 2: Vietnam's mineral exports to the country that is buying them are adversely affected by the distance between the two countries' physical locations.

Specialized insurance is necessary because the majority of Vietnam's mineral exports are raw materials with low value but high transportation risk. This observation is corroborated by research models, including those by Pham Kieu Phuong, Le Ngoc Bao Tran (2022), Nguyen Thi Kim Ngan, and others, which demonstrate an inverse link between geographic distance and export volume. Ghemawat (2001), Quang Huy (2014), and Kristjánsdóttir, H. (2005).

Hypothesis 3: Vietnam's mineral exports to the importing nation are positively impacted by the level of trade liberalization in that nation.

Lower tariffs and non-tariff barriers will give imported goods a chance to compete and advance alongside domestic products and boost the number of goods exported to that nation. Particularly, studies by Ly and Zang (2008), Kang (2014), Genç & Law (2014), and Dao Ngoc Tien (2013) have shown that trade liberalization levels and tariff barriers in general have a direct and positive impact on a commodity's export potential.

Hypothesis 4: Vietnam's resource exports to other nations are positively impacted by global mineral prices, particularly coal prices.

The global market's prices are influenced by the supply and demand of commodities across international borders. The study team, led by Master Nguyen Thang and Master Lai Van Manh's group discovered that the price of minerals on the global market, particularly the price of coal, had an impact on Vietnam's increase in export output.

Hypothesis 5: Vietnam's mineral exports to other nations are negatively impacted by the Law on Environmental Protection 2014.

The deposit for environmental rehabilitation and restoration has started to apply to mineral mining activities as of the Law on Environmental Protection 2014. The Law on Environmental Protection 2014 has therefore given the organization reason to believe that it will have a detrimental effect on Vietnam's mineral export turnover to other nations.

Hypothesis 6: The Minerals Law 2010 has a detrimental effect on Vietnam's exports of minerals to foreign nations.

Incorporating actual CO₂ emissions measurements, this coefficient describes the impact of the passage of the Minerals Law 2010 on Vietnam's mining industry and mineral exports. According to MSc Lai Van Manh's research, the implementation of Directive 02 on strengthening state management over mineral exploration, exploitation, processing, use, and exportation has adversely affected export activities. export of minerals, specifically reducing the output of mineral ores for export. It is conceivable that the Law on Minerals and the environment have a bad relationship.

2.3. Methods

Table 1 - Data collection sources and methods

Variable	Variable name	Explanation	Unit	Sources of data
Dependent variable	EXP _j	Vietnam's mineral exports to country j	USD	UN Comtrade
Independent variables	GDP _{Xj}	Gross domestic GDP of the country importing	Billion USD	World Bank
	DIS _j	Geographical separation between the capitals of country j and Hanoi.	Km	CEPII

Source: Compiled by the research team.

In accordance with the global trend of green exports, this study examines the variables affecting Vietnam's mineral exports. Examining how these variables affect export value will help to inform policy recommendations for Vietnam's mining industry. The study employs quantitative analysis by gathering secondary data on factors

from 2000 to 2021 from various information sources. We use the Pooled OLS model, the Fixed Effects Model (FEM), and the Random Effects Model (REM), three common models for panel data. First, several diagnostic tests are performed on the Pooled OLS model, including the White test for variance changes, the VIF test for multicollinearity, the test for multicollinearity of independent variables, and the Wooldridge test to evaluate the model's autocorrelation phenomenon. Second, if the Pooled OLS model is deemed to be inadequate, the team will carry out additional analyses to compare the FEM and REM models using the Hausman test, the Lagrange multiplier test, the test for autocorrelation, and FGLS to rectify REM model faults.

3. RESULTS AND DISCUSSION

3.1. Results

Table 1 displays descriptive statistics for the model's variables which indicates a significant gap between the value of minerals imported from Vietnam and the GDP of those nations. Furthermore, there are quite big discrepancies between nations in terms of trade freedom and distance, indicating that Vietnam has engaged in rather broad commerce in the area and worldwide.

First, Table 2 shows the Pooled OLS regression model of our study model as a baseline with R-squared = 21.76%, which means that the stated factors explain 21.76% of the change in Vietnam's mineral export turnover to the global market. The results in the table above reveal that GDP, the importing country's level of free trade, the distance, and the Law on Environmental Protection 2014 are all statistically significant at the 5% significance level. In which, addition to the distance variable and the Environmental Protection Law 2014, the other two factors have a beneficial influence on Vietnam's mineral exports, which are entirely compatible with the theory given above.

The team then ran various tests on this model in which all variables have a variance exaggeration factor VIF of 10 and a mean VIF value of less than 2. As a result, the group concludes that the model currently lacks multicollinearity. Regarding the linear correlation test in the model, the absolute values of the correlation coefficients between pairs of independent variables are less than 0.8. On that basis, the research team concludes that the model does not have multicollinearity between pairs of independent variables. However, when the Pooled OLS model's Test of Autocorrelation and Varied Variance is run, the results demonstrate that the model is ineffective since both autocorrelation and variance error change occurs.

Following that, the author conducted FE and RE regression for Vietnam's mineral exports to 15 key trade partners, even though the FE approach is only used to analyze the influence of variables changing over time, and hence does not provide findings for the fixed variable over time. When we used the fixed effect model in this situation (without the distance variable), we got the following findings. Because the P value for the FE and RE findings is $0.0000 < 0.05$, the research team may infer that the FEM and REM are more appropriate than the Pooled OLS model. The next step is to utilize the Hausman test to select the most appropriate and optimal model among two fixed or random effects models. The Hausman test findings, when run on the software, show that $\text{Prob} > \text{Chibar}^2 = 0.8485 > 0.05$, indicating that the REM model is a better match. As a result, the REM model will be used for regression among the three OLS, FEM, and REM models to examine the variables influencing Vietnam's mineral exports from 2000 to 2021. Evaluating the phenomenon of variable variance using the Lagrange Multiplier Test and autocorrelation demonstrates that the REM model is still insufficient because both phenomena exist.

Next, we may utilize GLS (Generalized Least Squares) estimation to avoid the phenomena of autocorrelation noise error and variable variance in the model chosen through testing for unbiased and efficient estimate results. Following the Hausman test, here is the REM model. We can see from the results of running the FGLS model to overcome the flaws in the REM model that the independent variables of national GDP, geographical distance, and the Environmental Protection Law 2014 all have significance levels P value 0, 01, indicating that these independent variables included in the model are suitable and have a significance level of 1%. The Minerals Law 2010 has significance > 0.01, that is, when GLS regression is not statistically significant, for the variables of trade liberalization and world mineral prices. The correlation of the independent variables with the dependent variable in the GLS model is comparable to the correlation in the author’s three models of OLS, FEM, and REM.

Table 6 - Results from FGLS model

Estimation results of the regression model:

$$\ln EXP_i = 14.32975 + 0.3843974 \times \ln GDPX_j - 0.7189489 \times \ln DIS_j + 0.5737801 \times \ln TFD_j + 0.2664904 \times \ln WPR - 0.0527098 \times EL + 0.0409503 \times ML + \epsilon_i$$

3.2. Discussion

For the GDP variable of the importing country, all four models demonstrate that the importing country’s GDP variable is statistically significant at the 5% level and has a favorable influence on Vietnam’s mineral exports. This variable considers the size of the market and the size of the economy, so the findings are consistent with earlier assumptions. Because the stronger the other components, the greater the importing countries’ purchasing power, consuming capacity, and import demand. This is consistent with prior research by Kebede Bekele (2011), Muhammad Taqi (2021), and authors Bui Thi Hong Hanh and Quiting Chen (2017). Furthermore, the FGLS model’s final study results demonstrate that the coefficient of the import nation GDP variable has the biggest magnitude in the model. Countries with the biggest GDPs in the world, such as China, Japan, Korea, and India, always account for a large amount of Vietnam’s mineral imports.

As predicted, the geographical distance component has the opposite effect on export output, which is similar to the previous research. Nguyen Huy (2014) and Kristjánssdóttir, H. (2005) found a negative association between geographical distance and export output in their investigations. This effect can

be explained by the export value of minerals because raw resources are not as valuable as electronic equipment, the difference between nations is wider will raise transportation costs, and delivery time, and harm product quality.

Concerning the mineral importing nation's degree of trade liberalization, the study team lacks sufficient evidence to infer that the variable degree of trade liberalization in the importing country influences Vietnam's mineral exports to that nation. Abidin et al., as well as Ly and Zang (2008), found comparable results. It is also understandable that when trade liberalization is high, trade barriers are low, lowering the cost of two-way customs. However, in the case of mineral goods, some nations are unable to self-regulate production or have limited internal resources, forcing them to rely on other exporting countries. Typically, in India, even though the index of free trade was only around 25/100 in the early 2000s, the average import rate of 5 million USD is similar to the import level of Philip 5.4 million USD in the period 2015-2020, while the index of free trade falls around 80/100. Thus, the organization believes that, in the mining business, the importing nation's level of trade has had minor impact on Vietnam's export turnover to that country.

For the world national mineral price variable, all four models demonstrate that the world national mineral price variable is statistically significant at the 5% level and has a favorable influence on Vietnam's mineral exports. This finding is also compatible with the work of authors Bui Thi Hong Hanh and Quitting Chen (2017), as well as Master Nguyen Thang and Master Lai Van Manh's group demonstrated that global resource prices (particularly coal prices) have an impact on raising Vietnam's export output.

According to the regression results, the Minerals Law 2010 has a beneficial influence on the value of Vietnam's mineral exports. Although this finding deviates from hypothesis and theory, it is clear from the practical execution of the Minerals Law in Vietnam that there are two key causes. The first reason is that the Minerals Law 2010 mandates that the results of the geological study (including investigation and appraisal of mineral potential) have been employed in many businesses: Construction, Industry and Trade, Transportation, Agriculture, etc but there is no regulation in the Minerals Law 2010 on the responsibility of refunding the State's invested funds to organizations and individuals when using geological information and data for construction projects in the above economic sectors. As a result, mineral miners may use information from geological surveys to improve mining efficiency and save time and money on self-investigation. The second reason is that, while there are no direct rules to encourage firms to innovate and invest in advanced and contemporary technologies, the Minerals Law 2010 has merit in creating broad norms to stimulate the development of new technologies effectively using resources, hence providing inspiration for numerous firms that have invested in and improved technology. Mining becomes easier and more convenient when firms are driven to invest in equipment and machinery and comprehend the right mining legislation, as demonstrated by Kendra's research. According to E.Dupuy (2014), many resource-rich countries liberalized their mining laws in the 1980s and 1990s to encourage foreign direct investment, resulting in a "restructuring geographical structure of capital flows in the mining sector" by allowing countries to receive an increasing inflow of mining capital.

Conducting the final test, the study verifies the regression results of the Law on Environmental Protection 2014 and shows that there is a negative impact on the value of mineral exports. Evidence suggests that there is a strong relationship between environmental regulation and export trade (Xu 2000; Dagar et al. 2021; Fang et al., 2019; Kamal et al. 2021). Strict environmental standards can facilitate the transition of developing countries to cleaner production processes (Nielsen, 2011).

4. CONCLUSIONS AND POLICY

This study investigates the export trends of mineral products in green economic growth in VietNam within 22 years between 2000 and 2021. The study uses Quantitative methods applying the gravity model of trade. According to our results, the GDP of the importing nation, the global price of minerals, and the Minerals Law 2010 all have a positive impact on Vietnam's mineral exports, while the distance between Vietnam and the importing nation and the Environmental Protection Law 2014 have a negative effect. Only the Minerals Law 2010 variable has the opposite result, and the degree of free trade of the importing country has no impact on mineral exports from Vietnam to that country. The research team's findings largely support the research hypothesis. Since then, the research team has come to some astounding conclusions regarding the effects of policies, including:

Firstly, the Minerals Law 2010 and the measurement of CO₂ emissions into the environment have had a positive impact on Vietnam's export turnover. The Mineral Law has provided an effective legal framework for the mining industry.

Secondly, the Environmental Protection Law 2014 and the measurement of CO₂ emissions have shown that strict regulations on environmental protection, along with tax rates, have led to a decrease in Vietnam's mineral exports to other countries.

To further elaborate on the actions that need to be taken, first, regulations on the responsibility to return the State's invested funds to individuals and organizations using geological data and information to serve construction work and mineral exploration and exploitation activities should be added. This will ensure that companies are held accountable for the funds they have received and used for mining activities. Moreover, Ministries and agencies should add specific requirements on accounting for environmental restoration costs and supporting the construction and renovation of technical infrastructure works caused by mining activities. This will ensure that companies comply with their commitments to improve and restore the environment during and after mining. It is also important to improve the policy on fees and taxes to avoid the loss of resources and revenue for the State budget. Vietnam's natural resource tax rate is still quite high compared to other countries in the region and the world (Australia stipulates a royalty's tax for ores of 7.5%, concentrates of 5%, metals of 2.5%, while Vietnam's highest tax rate is 20%), leading to dishonest tax declaration and exploitation of reserves in excess of permitted reserves for profit purposes. By lowering the tax rate and enforcing stricter regulations, the mining industry can become more sustainable and contribute to the country's economic growth. In addition, the Mineral Law needs to be supplemented with the basic task of geological investigation, which includes serving, assessing the potential for use, and planning the national long-term reserve. Additional traceability of minerals should be added to distinguish them from illegally exploited minerals. This will ensure that the mining industry operates in a transparent and legal manner. To further promote the growth of the mining industry, the Government should issue regulations on building mineral reserve centers in localities with large mineral resources to process the minerals that are not yet available for deep processing. This will create more jobs and attract more investors to the mining industry. Lastly, mineral planning needs to be organized, and the state needs to provide businesses with extensive information and timely support for problems in the mining process. By implementing these actions, Vietnam's mining industry can become more sustainable and contribute to the country's economic growth.

IMPACT OF GREEN BARRIERS ON VIETNAMESE AGRICULTURAL EXPORTS TO MAJOR TRADING PARTNERS

Name of authors: Truong Ngoc Dieu An¹, Vo Thi Thien An², Bui Le Nhu Hoa², Tran Thi Thao Nhi²

Supervisor name: Doctor Nguyen Thi Thuy³

ABSTRACT: In recent years, green trade barriers have gradually become an important factor affecting Vietnam's agricultural exports. In this study, we aim to describe the trend of green barriers imposed on Vietnamese agricultural products by our five major markets including the USA, China, South Korea, Japan, and the EU. Also, this study investigates the impact of green trade barriers of five major markets on Vietnam's agricultural export during the period from 2009 to 2021 by using the gravity model. Using hand-collected data on green barriers from WTO, we find that the number of green trade barriers has increased annually, in which organic products and chemical residues are the most concerned aspects among five studied markets. The result also reveals that green barriers restrict the value of the export of Vietnam's agricultural products. Based on the research results, several recommendations are proposed to the Vietnamese government as well as domestic enterprises to improve export efficiency as well as enhance competitiveness on the world map of agricultural products.

Keywords: Green trade barriers, Vietnamese agricultural products, Gravity model

1. INTRODUCTION

1.1. Background

The agriculture sector plays an indispensable role in Vietnam's economy and society and also has contributed to socio-political stability, industrialization and modernization of Vietnam over the past 40 years. In the context of the global wave of agricultural trade emerging, Vietnam is taking advantage of available resources to join that race as a strong competitor with export scale as well as a variety of agricultural products. Thanks to the many Free Trade Agreements (FTAs) signed, the tariff for Vietnam's agricultural product export has been reduced. However, there is an increase in a number of non-tariff barriers, particularly green barriers as people pay more attention to health and the environment, especially after the Covid-19 pandemic.

One of the most essential non-tariff measures, also the main research object in this study, is green trade barriers. The most specific and clear definition is provided by Wei Wei (2019, p.193): "A green trade barrier is one form of non-tariff barriers, also known as ecological barriers. It refers to the imported countries through the strict green technical standards, complex health quarantine system or use of green environmental marks and green subsidies to restrict or prevent imported goods, so as to achieve the purpose of protecting the ecological environment, human and animal and plant health". However, some developed countries and other factors have applied these regulations to control imports from developing countries, where environmental standards are lower. These barriers are also considered as non-tariff ones and there is no international organization or a common policy framework, which is powerful enough to enforce these barriers.

1.2. Research rationale

Many of the previous research were carried out in countries such as China, Japan, South Korea, etc., however, the findings of earlier research will not be appropriate considering the discrepancies in the state of Vietnamese agriculture now due to difference in natural conditions, in the level of economic development and business capacities, and in the food safety and environmental standards. Therefore, how green trade barriers affect exports of agricultural goods should be conducted in the context of Vietnam. The 2019 signing of the EVFTA has altered the picture of Vietnam's agricultural exports to the EU. Therefore, studies in this literature that study Vietnam mostly examine the export of Vietnamese agricultural products to the EU under the impact of green trade barriers. However, over-concentrating on one market can lead to some risks and missed opportunities in other potential markets. Additionally, Vietnam's government has always set targets for promoting and expanding the export market of agricultural products. Consequently, this research will study the relationship between green barriers and the value of agricultural products exported to not only the EU but also other major importers including the USA, China, Japan, and South Korea.

Furthermore, using hand-collected data, we provide up-to-date trends of green barriers on Vietnam's agricultural products by employing descriptive statistics to determine which particular sectors of Vietnamese agricultural products are most concerned by five markets and each one through their imposing green trade barriers on those sectors.

Based on the analyzed data, it can afterwards make appropriate solutions for the current scenario, specifically for government, industry associations and domestic enterprises to adapt to the requirements of our main trading partners and improve the export situation of Vietnamese agriculture products.

1.3. Research aims and objectives

This paper aims to analyze the impact of green trade barriers on Vietnam's agricultural export, which is exported to five major markets during the period from 2009 to 2021. Accordingly, some recommendations will propose agricultural development to a further step, meeting the requirement related to green barriers from highly demanding markets around the world.

The investigation consisted of four objectives. Firstly, we determine the current situation of Vietnam's agricultural exports and the trend of green barriers for Vietnam's main export markets. Secondly, we find out the relationship between the number of green barriers and Vietnamese agriculture exports via the Gravity model. In addition, another objective of this study is to identify which type of green barrier (TBT or SPS) has a more prominent impact on the export of Vietnamese agricultural products. Finally, some recommendations which develop Vietnam's agriculture situation in the next period will be proposed.

2. LITERATURE REVIEW

2.1. Green trade barriers

2.1.1. Definitions

Green trade barriers' definition has been suggested by many research conducted in this literature, although not exactly the same, there are various similarities. In which, the most specific and clear definition is provided by Wei Wei (2019): A green trade barrier is an ecological non-tariff barrier that restricts or prevents imported goods using strict technical standards, health quarantine systems, environmental marks, and subsidies to protect the environment, human health, and plant and animal life.

Apart from this definition, green trade barriers can also be seen as the tool for developed countries to restrict or forbid the import of foreign goods in the name of safeguarding finite resources, the environment, and public health (Dapeng Ren, 2018); or the restrictions imposed by a country or a group of countries

on imported goods from other countries based on environmental concern (Khoi & Thuy, 2013); or the set of strict market access regulations put in place by industrialized countries with superior technological capabilities (Chen & Xiao, 2023).

2.1.2. Types of green trade barriers

There are four types of green barriers that are usually imposed by importing countries. The first type taken by the nation to safeguard the environment and the health of its population was to adopt green technology legislation and standards based on its unique technological advantages. The second is a green packaging system, which requires ecologically friendly and recyclable or naturally degradable packaging. The third option is the “green environment symbol” received after meeting demanding certification requirements and certification processes. The fourth is the green health and quarantine system which is strictly implemented by the customs (Wei Wei, 2019).

2.1.3. Causes of green trade barriers

(1) Trade protectionism is the first reason. As traditional trade barriers are gradually removed, developed nations are compelled to figure out how to safeguard their trade and economic interests (Dapeng Ren, 2018).

(2) The tendency toward environmental protection as people’s living conditions and understanding of the value of environmental protection rise is the second factor that leads to the establishment and implementation of policies, organizations, and laws to safeguard the environment, human health, and ecological balance on products imported (Dapeng Ren, 2018).

2.2. Effects of green trade barriers on export

2.2.1. Positive effects

Green barriers are said to be a reflection of people’s increased awareness of environmental conservation worldwide, which is encouraging greater environmental protection measures (Dapeng Ren, 2018 and Fang Luo, 2019). Since then, exporting nations have had to focus more on adopting modern, sustainable development strategies for agriculture and eliminating archaic methods or techniques. This encourages employment in associated industries within the exporting nation as well as the export of agricultural products (Wei Wei, 2019).

These green standards help to improve the quality of agricultural exports and advance agricultural research and technology in the direction of sustainable development (Wei Wei, 2019). When a product passes rigorous testing procedures, green packaging standards, green visa requirements, and other restrictions, the significant expenditures can be completely offset by an increase in the cost of high-quality items (Fang Luo, 2019). Customers will soon be able to use goods that are focused on their health and the environment, both at home and around the globe.

Green barriers also help limit production and trade practices that cause ecological damage and environmental pollution (Dapeng Ren, 2018). Wei Wei (2019) also found that green barriers significantly improve the sustainable development plans of exporting nations and uphold a favorable trade-environment equilibrium. In the long run, when other fundamental factors remain constant, research by Chen Gong (2019) demonstrates that green trade barriers can foster technological advancement, nurture an eco-sustainable economy, and enhance the quality of exported products, ultimately weakening export barriers.

2.2.2. Negative effects

Su (2021) claims that green trade barriers will make it more difficult for agricultural products to be exported, restrict the flow of trade between different nations, and decrease the volume of agricultural products traded between two nations because it takes time to develop the export market for agricultural products and optimize its structure. At the same time, when more tests must be conducted, more processes must be improved, more procedures must be followed, etc., the export effectiveness and cost advantages of agricultural products from developing nations decrease (Li & Zhu, 2020).

Wei Wei (2019) raises the issue of enacting green trade barriers as a factor in the escalation of bilateral and multilateral trade tensions between nations if exported goods are routinely rejected due to low quality or failing to meet environmental protection criteria. Developed nations may also raise the ecological dumping fee because they think that developing nations do not have enough environmental awareness or environmental laws (Pang & Wang, 2018).

Due to the aforementioned factors, green barriers are making it more difficult for businesses to expand internationally, tap new markets, and fully utilize their own competitive advantages as well as those of other nations and businesses (Lin, 2012). This has a negative effect on the exporting nation's economic growth.

2.2.3. Empirical research

Le Thi Thu Huong (2015) and Vu Thi Thanh Huyen (2022) used descriptive statistics on Vietnam's major agricultural export value and the number of products being returned by the EU for not complying with their standards and procedures to measure the effects of green trade barriers from the EU, to make conclusions about the challenges in the early stages of Vietnamese agricultural products as well as the increasingly promising future.

Chen Gong (2019) examines China's agricultural exports from 2002 to 2016 to nine different markets and finds that when the first green trade barrier is encountered, both the export value and the competitiveness of Chinese agricultural products fall. But over time, trade restrictions on goods with high environmental impact have helped China's agricultural exports.

By using the total TBT and SPS that various nations report to the WTO as an indicator of green barriers, Su (2021) demonstrates that green trade barriers will temporarily lower agricultural exports due to an increase in regulatory and trade conflicts.

Nguyen Thi Thu Hien et al. (2022) studied the effects of non-tariff measures (NTMs) from the EU by focusing on technical barriers to trade (TBT) and phytosanitary measures (SPS) in addition to research conducted abroad and more in-depth analyses of our nation. According to research findings, Vietnam's agricultural exports are positively impacted by EU's SPS and TBT standards.

Le Thi Viet Nga et al. (2021) conducted another study that examined and evaluated the impact of US non-tariff measures on Vietnam's agricultural and fisheries export flows, concluding that TBT had a significant negative effect while SPS measures had no discernible effect on Vietnamese exports.

3. METHODOLOGY

Due to the prevalence of the gravity model in discovering the relationship between not only green trade barriers but also other factors affecting international trade and the bilateral trade flow in this literature, it is selected to resolve the research question of this study. It is formulated as following:

$$Y_{ij} = \beta_0 X_i^{\beta_1} X_j^{\beta_2} D_{ij}^{\beta_3} \zeta_{ij} \quad (1)$$

and then conduct a log-log transformation, which results in:

$$\ln Y_{ij} = \ln \beta_0 + \beta_1 \ln X_i + \beta_2 \ln X_j + \beta_3 \ln D_{ij} + \ln \zeta_{ij} \quad (2)$$

In which, Y_{ij} is trade from country i to country j , X_i and X_j denote the product of the two countries' economic size (GDP or/and population), and D_{ij} represents a geographical distance between i and j . Subsequently, the parameters β_0 , β_1 , β_2 , and β_3 are identified by Regression Analysis (Krisztin & Fischer, 2015).

Based on the original model and its extended version, we will propose a gravity model that is appropriate to this research. However, the data construction has to be conducted previously.

We consider first our dependent variable - Vietnam's agricultural export value, with the definition of agricultural products provided by WTO, particularly from WTO Agriculture Agreement. Its coverage is a list of HS Chapters, HS Headings and HS Codes related to what products are considered to be agricultural. Then, we measure the agriculture export value by collecting each product's export value based on HS from Trademap and summing them up.

The second variable is an independent one, which we make all effort to study in this research, green trade barriers. It is also considered as trade-related environmental measures that the WTO routinely expresses concern over (Khoi & Thuy, 2013). According to the WTO, two standards-related agreements, the SPS and TBT Agreements, are used to impose green trade barriers (Khatun, 2009). In which, the TBT Measures can take the form of product standards, testing requirements, and other technical requirements including testing, labeling, packaging, marketing, certification, origin marking, and health and safety. And the SPS Measures include all relevant regulations, requirements, and procedures used to ensure the safety of agricultural products for humans, plants, and animals. This comprises processes and production methods; testing, inspection, certification, and approval procedures; quarantine requirements for transporting animals or plants; procedures and methods of risk assessment; and packaging and labeling requirements related to food safety (Office of the United States Trade Representative). Therefore, the number of green trade barriers is estimated as the sum of TBT and SPS which is notified on the WTO Environmental Database.

As the trade restriction, the increase of green trade barriers, or TBT and SPS individually would hinder the export of agricultural products of a nation - a sector closely related to health and environment issues. Thus, it is hypothesized that:

H1: The number of green trade barriers has a negative influence on Vietnamese agriculture export value; H2: The number of TBT has a negative influence on Vietnamese agriculture export value;

H3: The number of SPS has a negative influence on Vietnamese agriculture export value.

Other variables would be included in the model, which are GDP of partner countries and Vietnam (source: World Bank data), population of partner countries and Vietnam (source: World Bank data), geographical distance from partner countries to Vietnam (source: Distance calculator), real exchange rate between the currency of partner countries and USD (source: World Bank data), the openness of importing country, equal to the percentage of their total import value of goods to GDP (source: World Bank data).

Regarding factors affecting Vietnam's agriculture exports which are used in proposed gravity model, it can be written as follows:

$$\ln(X_{ij,t}) = \ln(\beta_1) + \beta_2 \ln(GDP_{j,t}) + \beta_3 \ln(GDP_{i,t}) + \beta_4 \ln(POP_{j,t}) + \beta_5 \ln(POP_{i,t}) + \beta_6(DIST_{ij}) + u_1 RER_{CUR/USD,t} + u_2 OPEN_{j,t} + u_3 GRB_{j,t} + e_{ij,t} \quad (3)$$

In which, $X_{ij,t}$ is Viet Nam's agricultural products exports value to country j in year t ; $GDP_{j,t}$ and $GDP_{i,t}$ represent GDP of country j and i in year t ; $POP_{j,t}$ and $POP_{i,t}$ represent population of country j and i in year t ; $DIST_{ij}$ is geographic distance between Hanoi (Viet Nam's capital) and the capital of country j ; $RER_{CUR/USD,t}$ is the real exchange rate between the currency of country j and USD; $OPEN_{j,t}$ denotes the openness of country j in year t ; $GRB_{j,t}$ is symbolized for the number of green barriers that country j applied on imported agricultural products in year t ; and $e_{ij,t}$ is statistical error, β and u are parameters need to be calculated.

The data is collected among five major export markets of our country - the USA, China, Japan, South Korea, and the EU over 13 years for the period of 2009 - 2021. Because of Vietnam's integration into the WTO in 2009, our nation has been suffering from green trade barriers from the WTO system - TBT and SPS Agreements.

STATA is used throughout the whole data processing process. Firstly, we shall run the gravity model through the OLS method, then conduct Breusch-Pagan test to identify whether the variance is homogenous. If it is not homogenous which means the result from the OLS method cannot be taken to be analyzed, consequently we continue to conduct the model under the Fixed Effects (FE) and Random Effects (RE). After that, we perform the Hausman test to determine the correlation accurately and reasonably between the error term and the independent variables, thereby having a basis to indicate the appropriate explanatory model.

4. ANALYSIS

4.1. Descriptive analysis

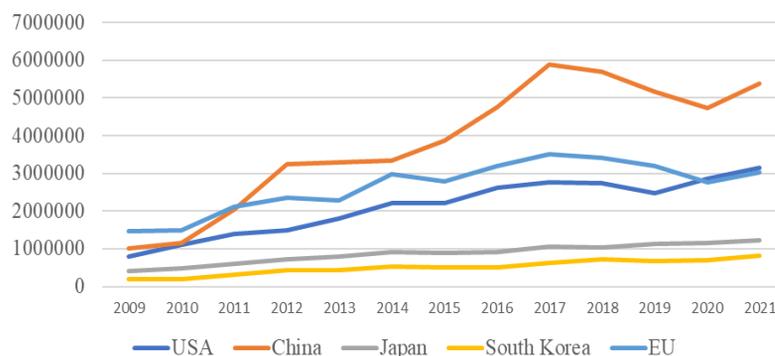

Figure 1. Number of green trade barriers during 2009 - 2021 of five studied markets

After conducting descriptive analysis and classifying green trade barriers based on their imposed object, we have come to the conclusion that currently, the number of green barriers offered from the aforementioned five markets is increasing year by year. In which, the EU and the USA were the two markets that imposed the highest number of green barriers on Vietnam while China was the least demanding market.

Table 1. Classifications of green trade barriers in 2021

	The USA	China	Japan	South Korea	The EU	Total
1. Organic	19	1	10	12	26	68
2. Chemicals	16	5	11	4	65	101
3. Labelling	0	1	1	4	2	8
4. Food	1	0	0	6	9	16
5. Plant	23	2	5	8	8	46
6. Animal	7	2	7	1	7	24
7. LMOs/GMOs	4	2	0	6	6	18
8. Production Process	1	1	0	0	4	6
9. Others	3	1	2	2	5	13

With the chemical field receiving the most attention among 5 markets, Japan, the EU and China had the highest number of green barriers in terms of controlling the amount of use and residues of pesticides in agricultural products. Besides, America was more interested in plants, while the green barriers coming from South Korea were imposed more on organic products.

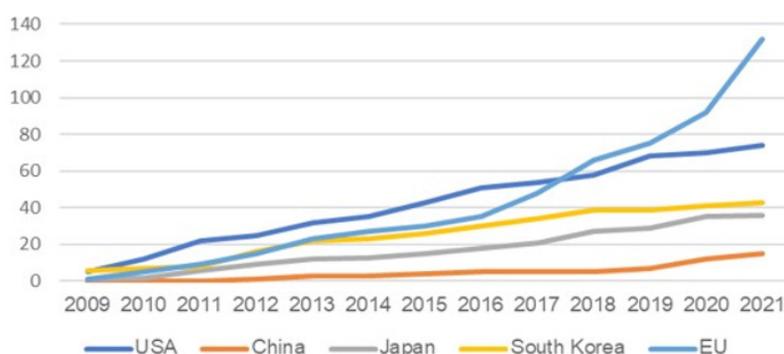

Figure 2. Vietnam's agricultural products export value during 2009 - 2021 based on country (thousand USD)

Simultaneously, the total amount of agricultural exports has fluctuated during the period from 2009 to 2021 (increased in the period 2009 - 2021, but declined in the years 2018 - 2020), but still increased markedly with a growth rate of 350.99%. China has been the largest importer of agricultural products from Vietnam. Among the five import partners studied, Japan and South Korea were the two countries with the lowest import value. However, the value of all imported agricultural products from Vietnam to them has been continuing to rise. By contrast, the value of agricultural exports to the US, the EU, and China fluctuated significantly.

4.2. Impact of green trade barriers on Vietnamese agricultural export value

We run the gravity model for Regression Analysis with OLS, Breuch-Pagan test, then conduct Random Effects, Fixed Effects and Hausman test for the consequently selection: we take the result of Random Effects as the figure truly reflects the effect of green trade barriers and its components on Vietnamese agricultural export value.

Table 2. The result from running the Gravity model by Random effects with the difference in considering the green trade barriers

	Coefficient of (1)	Coefficient of (2)	Coefficient of (3)	Coefficient of (4)
lnGDPp	0.203*	0.258**	0.211	0.279**
lnGDPvn	1.187***	1.086***	1.316***	1.069***
RER	0.0880*	0.0731	0.121**	0.0714
OPEN	0.00635***	0.00857***	0.00445*	0.00916***
lnPOPp	0.490***	0.470***	0.480***	0.462***
lnPOPvn	1.081	1.715	-1.191	1.618
lnDIS	0.122	0.0807	0.0508	0.0577
Green Barriers	-0.00548***			
TBT		-0.00905***		-0.00985***
SPS			-0.00685*	0.00210
Constant	-43.72	-53.97	-3.961	-52.03
R ²	0.9785	0.9799	0.7785	0.9800
Standard errors in parentheses: *** p<0.01, ** p<0.05, * p<0.1				

In which, the model (1) is applied to discover the impact of green trade barriers, as the sum of TBT and SPS on export value of Vietnamese agricultural products. The (2) and (3) consider green trade barriers as only TBT and only SPS to find out whether each one affects the dependent variable. Finally, the (4) regards both TBT and SPS in the model but individually.

Based on the result of model (1), it can be implied that the coefficient $R^2 = 0.9785$, indicating that the variables in the model (GDP, population, real exchange rate, proportion of total import value to GDP, distance, and the number of green barriers) account for more than 97% of the variation in the export of the studied observations.

We observe a negative correlation between the quantity of green barriers and the value of agricultural exports from Vietnam, with a coefficient of -0.0055. Vietnam's agricultural exports lose 0.5% of their value for every additional green barrier, which can be considered as a large number with exports' value up to dozens of billions of dollars per year. This maladaptation of the increasing number of green trade barriers can be explained by Vietnam's low output requirements and standards for agricultural products, lax inspection systems, underdeveloped technology and production systems, insufficient nation's agricultural investment in research and development, and lack of a strong environmental protection consciousness.

From the result of the VIF test and correlation matrix, the VIF values of TBT and SPS are 6.34 and 5.91 respectively, both greater than 2, which means that these two variables have signs of multicollinearity. In addition, the correlation coefficient of TBT with SPS is up to 0.8652, showing that these two variables have an intimate, close and inevitable relationship. That is the reason why we include TBT and SPS as two variables in one model to get a more comprehensive result instead of indicating the result from the model in which TBT and SPS are considered in two separate equations.

Thus, the result that will be analyzed is taken from model (4). After running the data according to the gravity model with both TBT and SPS, we get the $R^2 = 0.9800$, that is, the variables included in the model account for 98% of the variation in the exports of the observed observations. With a coefficient of -0.00905, we see a negative relationship between the amount of TBT and the value of Vietnam's agricultural exports. When the amount of TBT that countries impose on agricultural products exported from Vietnam increases by 1, this export value will decrease by 0.9%. This impact is almost twice the influence of green barriers in general. This can be explained by the insufficient level of science and technology as well as the ability of Vietnamese farmers and export companies to apply this knowledge is not high enough to be able to fully

satisfy those technical requirements. This demonstrates that we must carefully and progressively think through the techniques and changes that must be put in place so that Vietnamese agricultural products may overcome these technical trade hurdles and still hold their position in the international market for agricultural exports.

By contrast, in terms of SPS, the coefficient has a positive sign. However, this figure is not statistically significant according to the high p-value, which is over 0.1. In other words, this sample of 65 observations shows that SPS has no effect on the value of agricultural products exported from Vietnam to the five studied markets.

Importantly, realizing the multicollinearity between population and GDP from VIF test, with the aim of verifying the accuracy of the relationship in this model, we run REM of panel data based on Gravity model according with the Robustness test without the “population of Vietnam” variable in the equation (5), and without the “GDP of Vietnam” variable in the equation (6).

Table 3. Robustness test results running from equation (5), (6) by Random Effects

	Coefficient of (5)	Coefficient of (6)
lnGDPp	0.270162***	0.4652825***
lnGDPvn	1.224211***	
RER	0.0829201***	-0.0085327*
OPEN	0.0085852***	0.0146817***
lnPOPp	0.4650449***	0.3776251***
lnPOPvn		10.91396***
lnDIS	0.0490746	-0.0199436*
TBT	-0.0092122***	-0.0132274***
SPS	0.002342	0.0046522*
_cons	-25.13935***	-203.928***
R ²	0.9798	0.9723

Standard errors in parentheses: *** p<0.01, ** p<0.05, * p<0.1

The outcome of equation (5) demonstrates that there is a strongly negative association between the number of TBT and the value of Vietnam’s agricultural exports, with a coefficient of approximately -0.00921 and a p- value of 0.000. Based on the incredibly low p-value, which showed a 0% chance of a wrong result, this finding is reliable.

However, SPS has no effect on the value of agricultural products exported from Vietnam to the five selected markets with p-value = 0.466 > 0.05 despite having a positive sign (+).

Subsequently, the equation (6) with a coefficient of about -0.0132 and p-value of 0.000, we see a significantly negative relationship between the number of TBT and the value of Vietnam’s agricultural exports. This result is trustworthy based on the extremely low p-value, which indicated the 0% probability of a misfigured result.

In the case of SPS, however, this result is not statistically significant (p-value = 0.171 > 0.05) despite having a positive sign (+). In other words, the value of agricultural exports from Vietnam to the five chosen destinations is unaffected by SPS.

To sum up, the finding of how TBT and SPS impact Vietnam’s agricultural export value does not change. Thus, these results once again affirm the correctness and strong persuasion of the impact of TBT and SPS on the value of exported agricultural products of Vietnam.

Next, with another concern of the effect duration of TBT and SPS, we conduct an additional test. Specifically, instead of solely examining the situation at time t as analyzed above, we would delve further into the coefficients and p-values of TBT and SPS at two preceding time points, t-3 and t-5. The underlying reason for this test is that we expect that the green barriers may have long term instead of only immediate effect.

Table 4. Robustness test result of Random-effect model considering the impact of TBT and SPS at 3 different points of time on Vietnamese agricultural export value

Variable	Coefficient	p-value
lnGDPp	0.3007139	0.000
lnGDPvn	0.9954786	0.009
RER	0.0749813	0.003
OPEN	0.0095757	0.000
lnPOPp	0.4496526	0.000
lnPOPvn	2.205266	0.500
lnDIS	0.0298443	0.680
TBT	-0.0093459	0.002
TBT(t-3)	0.0022874	0.816
TBT(t-5)	-0.0086951	0.259
SPS	0.0017556	0.758
SPS(t-3)	0.0053693	0.409
SPS(t-5)	-0.0020021	0.854
_cons	-61.42534	0.248
R-sq = 0.9804		

The results are shown in the above table. At t-3, the coefficient of TBT and SPS shows a positive sign (+), and at t-5, both TBT and SPS coefficients assume negative values, implying a negative impact despite their lacking statistical significance due to a p-value greater than 0.05 (0.816, 0.409, 0.259, 0.854 respectively).

Consequently, the export value of Vietnam at any given time point appears to be less affected by past green trade barriers in comparison to ones of that time point. As a result, it is evident that only TBT has a significant impact on the value of agricultural exports at the studied time point t, while the influence of SPS is negligible.

However, it is necessary to consider conducting the unit root test when the exceptionally high coefficient of determination (R^2) may be due to the spurious regression caused by data containing the unit roots or unstationary data in other words (Damodar & Dawn, 2009). On the other hand, the modest number of panels and time range of this research, which is under the value of 25 panels and 25 points of time, makes the existing possibility of above concern plunge, thus can ensure the reliability of the discovered results only taken from REM without carrying out the unit root test (Kazi, Umar, & Alam, 2018). Moreover, unit root tests tend to be biased and outperformed for the panel data constructed based on gravity model, so the outcome of all the models this research is trustworthy (Jarko, 2009).

5. CONCLUSION

The results of the gravity model show the opposite relationship between the number of green barriers imposed on Vietnamese agricultural products by five main markets in the world, including the US, China, Japan, South Korea and the EU and the export value of Vietnamese ones. These values have been proved to be adversely impacted by TBT but unaffected by SPS—two elements of green trade barriers. From a theoretical perspective, these results have contributed to enhancing the argument in this literature that in developing countries, particularly Vietnam, green trade barriers, as trade restrictions, have a negative impact on the value of agricultural products from Vietnam. Therefore, based on this theoretical contribution, practical problems can be solved by the appropriate solutions conducted by governments, businesses, and even citizens, not only concentrating on overcoming TBT, but also not ignoring SPS due to unexpected SPS in the future. In addition, through descriptive statistical analysis, it is shown that more and more environmental restrictions are placed on agricultural exports from Vietnam; this indicates that Vietnamese

agricultural products are under considerable pressure to adjust to those restrictions in order to facilitate customs clearance in importing nations.

Thus, we provide some suggestions to enhance Vietnam's agricultural product exports and expand the export market for Vietnamese agricultural products in view of the effects of green trade obstacles on Vietnam's agricultural exports that were described above. The government, industry associations and domestic enterprises need to focus on developing policies to improve Vietnam's system of standards and technical regulations in harmony with international standards to a reasonable extent and relatively promoting quality inspection and control systems in order to deal with challenging barriers from challenging markets.

All in all, the study's limitations would be mentioned. Specifically, our gravity model only employs traditional variances such as GDP, distance, population, etc. Future research should add more variances, for example, the index of development and application of science and technology to agriculture, to reflect a broader picture of the issue. Also, to adapt this purpose, we can extend research markets because in fact we trade agricultural products with many countries in the world but not only 5 countries we chose. Moreover, our source data is limited because we only collected data from the WTO database. Meanwhile, many countries impose environmental regulations on their national government's website.

UNLOCKING THE LINK: UNRAVELING THE INTERPLAY BETWEEN FOREIGN RESERVES AND FOREIGN EXCHANGE RATE - INSIGHTS FROM VIETNAM

Academic advisor: Ph.D. Nguyen Thi Thuy¹

Students: Vo Hoang Lam¹, Vo Nguyen Khoi¹, Nguyen Vuong Thien¹

ABSTRACT: *Given the dearth of prior research on this topic in Vietnam, this thesis provides a comprehensive evaluation of hypotheses using a pool of data from 1995 to 2022. The objectives of this paper are to provide basic definitions of linked variables and to investigate the fundamental relationship between exchange rate and foreign reserves. Specifically, the study aims to determine the impact of foreign exchange reserves on exchange rate volatility in Vietnam. The paper adopts a quantitative research approach and employs econometric methods to analyze the data. The findings reveal a short-term bidirectional impact between the real exchange rate and the foreign reserve, while the foreign exchange rate has a one-way impact on nominal exchange rate. The findings of the study are expected to contribute to the literature on reserve management and exchange rate stability in emerging market economies like Vietnam. The results of the study will provide policymakers with insights into the optimal levels of international reserves that Vietnam should maintain, as well as the appropriate policies to manage exchange rates and external shocks. Overall, this paper aims to pave the path for future expansion studies in this area of research.*

Keywords: *Foreign exchange reserve, real exchange rate, nominal exchange rate, VAR model, CPI, Inflation.*

1. INTRODUCTION

1.1. Research background

1.1.1. Practical background

Numerous studies have examined the relationship between international reserves and foreign exchange rates, highlighting the importance of maintaining financial stability and possessing adequate reserves to support the currency during crises. Developing economies, including Vietnam, face challenges that can destabilize their economies, making effective management of international reserves and foreign currency rates crucial. Previous research has shown that larger foreign reserves and central bank engagement in foreign currency markets are effective in maintaining currency rate stability and withstanding economic shocks. Vietnam's economy has undergone significant transformation, resulting in a dramatic increase in foreign exchange reserves from \$1.5 billion in 1995 to over \$100 billion by 2020. As a result, understanding the variables that contribute to reserve fluctuations and their impact on exchange rates is essential for policymakers to address key economic concerns. Therefore, this research aims to examine the link between Vietnam's foreign exchange reserves and exchange rate fluctuations to provide insights into the effectiveness of reserve management policies for emerging economies.

1.1.1. Theoretical background

The collapse of the Bretton Woods fixed exchange rate system in the early 1970s led to the adoption of the flexible exchange rate system. Despite the theoretical argument that countries under a flexible exchange rate system do not require reserve requirements, most still build up foreign exchange reserves. In particular, emerging economies are a suitable case to examine the relationship between changes in foreign exchange reserves and fluctuations in exchange rates. This research aims to analyze the relationship between changes in international exchange reserves and foreign exchange rate movements in Vietnam as an emerging market in Southeast Asia. The year 2022 witnessed significant global political and economic events that negatively

¹ University of Economics – The University of Danang.

impacted the value of the Vietnamese currency. By studying this relationship, this research seeks to provide insights into the effectiveness of foreign exchange interventions in developing nations and to offer valuable policy implications for monetary authorities.

1.2. Research objective

Analysis of the current state of Vietnam's foreign exchange reserves during the period of time between 1995 and 2022.

This study was set to defining the relationship between the actual foreign exchange reserve ratio and the exchange rate which will help in making the monetary policy decision.

1.3. Research scope:

This research is classified as an applied study that employs various prior literatures to create a model solely focused on analyzing the relationship between international reserves and foreign exchange rates in Vietnam.

This research is conducted in Vietnam, which has not been extensively studied in relation to the relationship between foreign exchange reserves and exchange rate fluctuations. Therefore, this study aims to strengthen the foundation of existing research on this topic and support further studies.

2. LITERATURE REVIEW

2.1. Key definition

2.1.1. Foreign reserve

According to Foreign exchange reserves are the supply of foreign currency held by the central bank of a country, which can be used to cover external payment imbalances, stabilize domestic currency value, and defend against speculative attacks on the foreign exchange market. These reserves are often denominated in various currencies, with the US dollar being the most common. Holding foreign exchange reserves can help a country maintain stability and manage external shocks, but there are potential drawbacks such as opportunity costs and attracting speculative capital flows. The accumulation of foreign exchange reserves has been a trend among developing countries, particularly in Asia, and policymakers must carefully evaluate the costs and benefits of holding reserves to ensure they are being used effectively and efficiently.

2.1.2. Exchange rate

Exchange rate refers to the value of one currency compared to another, and there are two types: nominal and real exchange rates. Nominal exchange rates are determined by market forces of supply and demand and can be affected by various factors, including inflation rates, interest rates, trade balances, and geopolitical events. In contrast, the real exchange rate takes into account inflation rates and provides a more accurate measure of the relative value of currencies over time. Factors that can cause changes in the RER include relative inflation rates, productivity, and terms of trade. Understanding exchange rate dynamics is crucial for policymakers and businesses engaged in international trade and finance.

2.1.3. CPI

The Consumer Price Index (CPI) is a weighted average of prices of goods and services purchased by households, used to measure the general price level in an economy and reflect changes in purchasing power over time. The Bureau of Labor Statistics conducts a monthly survey to determine the market basket of goods and services, which are weighted according to their relative importance in consumer expenditure. The CPI has several uses, including as an economic indicator of inflation and adjusting other economic indicators for price changes. However, limitations include its inability to represent all population groups, not measuring every aspect that affects living standards, and excluding energy costs. Nonetheless, the CPI is an important tool for policymakers in making informed decisions about economic policies.

2.1.4. Inflation

The Consumer Price Index (CPI) is a weighted average of prices of goods and services purchased by households, used to measure the general price level in an economy and reflect changes in purchasing power over time. The Bureau of Labor Statistics conducts a monthly survey to determine the market basket of goods and services, which are weighted according to their relative importance in consumer expenditure. The CPI has several uses, including as an economic indicator of inflation and adjusting other economic indicators for price changes. However, limitations include its inability to represent all population groups, not measuring every aspect that affects living standards, and excluding energy costs. Nonetheless, the CPI is an important tool for policymakers in making informed decisions about economic policies.

2.1.5. Bretton Woods Systems

The Bretton Woods Agreement was established in 1944 by 44 nations to maintain stable exchange rates with the US dollar. The International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (IBRD) were created as part of the agreement. The rules of the international monetary system were established, with each nation basing its parity policy on the US dollar, which was valued at \$35 per ounce of gold. The Bretton Woods system was a dollar-based gold standard exchange system where only the US dollar could be exchanged for gold, and other currencies were only exchanged for US dollars. If a country's currency lost value compared to the dollar, its central bank would purchase its own currency, and if it appreciated excessively, the central bank would create more money. The system aimed to prevent trade wars and currency depreciation for the purpose of increasing commerce. However, countries could modify the value of their currency to aid in post-war reconstruction.

2.2. Research demonstrating the relationship between foreign reserve and exchange rate

The relationship between foreign reserves and exchange rates is a subject of significant research in the field of international economics. Understanding this relationship is particularly crucial for countries deeply engaged in global trade and financial transactions. Numerous studies have embarked on the journey of untangling this complex link, bringing forward vital insights and identifying consistent themes.

The accumulation of foreign exchange reserves is closely tied to the dynamics of the international market. When there is a significant demand for a country's home currency, its foreign exchange reserves tend to rise accordingly. Conversely, an increase in the supply of the home currency in the international market leads to a decrease in foreign exchange reserves. Therefore, one can perceive foreign exchange reserves as a residual holding that reflects the balance between currency demand and supply on a country's economic landscape.

Even under a flexible exchange rate system, policymakers often believe that accumulating foreign reserves can serve as a safeguard against potential volatility and uncertainty associated with such a system. This belief is supported by the research of (Obstfeld, Shambaugh, & Taylor, 2010), who highlight the role of reserve accumulation in managing domestic financial instability and exchange rates. They emphasize that factors such as financial openness, financial development, and exchange rate policy play a crucial role in the process of reserve accumulation.

Using a combination of theoretical analysis and empirical evidence, the authors find that higher levels of reserves relative to GDP are linked to a country's financial openness, level of financial development, and chosen exchange rate policy. This underscores the importance of carefully considering these factors to effectively utilize foreign reserves in managing financial instability and fostering sustainable economic growth. Additional support for this perspective comes from the research of (Cheung & Ito, 2009), which shows that countries with larger foreign reserves tend to experience lower exchange rate volatility. This effect is particularly pronounced in economies with liberalized capital accounts. In parallel, the empirical analysis by (Cheung & Ito, 2009) provides further evidence of the stabilizing power of foreign reserves. Their study

concludes that countries with higher foreign reserves tend to experience less exchange rate volatility. The link they identify is even stronger in economies that maintain open capital accounts, reinforcing the critical role foreign reserves can play as a stabilizing mechanism, even within the potentially turbulent setting of a flexible exchange rate system.

(Kalu, Ugwu, Ndubuaku, & Ifeanyi, 2019) investigation into the Nigerian market also supports this view. They discovered a positive and significant correlation between foreign reserves and exchange rates, indicating that increased reserve accumulation often leads to a depreciation of the domestic currency. This further underscores the critical role foreign reserves can play in managing exchange rates and maintaining macroeconomic stability in a flexible exchange rate environment.

While the findings of this study provide support for the strategic accumulation of reserves, it is important to heed the cautionary lessons put forth by (Levy-Yeyati & Sturzenegger, 2007). Their work sheds light on the potential risks associated with excessive reserve accumulation driven by the fear of currency appreciation. Their research underscores the potential drawbacks such as distorted economic incentives, limited flexibility in exchange rate policies, and even the possibility of triggering a currency crisis. Building upon the insights of (Levy-Yeyati & Sturzenegger, 2007), (Siregar & Pontines, 2012) study adds an additional dimension to the “fear of appreciation” or “fear of floating-in-reverse” behavior observed in East Asian currencies. Specifically, their findings reveal a higher degree of aversion to currency appreciation among East Asian currencies, particularly the Philippine peso and the Thailand baht, against the Chinese renminbi compared to the US dollar.

Foreign reserve accumulation serves as a tool to mitigate exchange rate volatility, particularly in developing countries experiencing higher exchange rate fluctuations. Countries with more open capital accounts tend to have a stronger impact of foreign reserves on exchange rates (Calvo & Reinhart, 2002). Additionally, countries with greater equity and bond portfolio inflows can benefit from higher levels of foreign reserves to stabilize their exchange rates. Capital controls also play a crucial role in stabilizing the foreign exchange market, particularly in countries where net equity and bond portfolio flows affect exchange rate volatility. The balance of payments serves as an intermediary to understand the influence of exchange rate changes on foreign reserves, as a current account surplus can enhance foreign reserves through surplus inflows (Nga, 2021). Exchange rate fluctuations can impact investor confidence and capital flows, potentially affecting a country’s foreign reserves (Magud, Reinhart, & Vesperoni, 2014). In economies with less flexible exchange rate regimes, foreign currency bank credit is more significant, indicating a higher likelihood of banks accessing external markets and engaging in foreign currency lending/borrowing during periods of large capital inflows. Consequently, regulatory policies, including reserve requirements on international lending, can mitigate hazardous borrowing and lending practices in foreign currency. In conclusion, foreign reserves play a crucial role in maintaining exchange rate stability and promoting economic growth, with various channels linking them to exchange rates.

2.3. Research demonstrating there are no relationship between international reserve and exchange rate

In addition to the previously mentioned multidimensional correlations between the two components, there are studies that make the opposite assumption, demonstrating the multidimensionality of the study issue. These researches demonstrated no relationship between international reserves and exchange rates.

(Christopher J. Neely, 2007) challenges the assumption that interventions by central banks in the foreign exchange market play a significant influence in setting exchange rate movements, finding no discernable association between global reserves of currency and shifts in exchange rates. The study suggests that conventional intervention practices may not yield the desired results in terms of exchange rate stabilization, calling for a re-examination of the efficacy of central bank intervention strategies and urging policymakers to explore alternative methods of managing exchange rate volatility.

Besides, (Humala & Rodríguez, 2010) research on foreign exchange intervention via international reserves and exchange rate volatility in Peru finds no compelling evidence that central bank interventions through reserves buildup or depletion can impact exchange rate fluctuations. The authors conclude that changes in reserves do not significantly influence exchange rate volatility, nor do exchange rate swings significantly influence the central bank's foreign reserves holdings. The study demonstrates the limitations of reserve-based programs to combat exchange rate volatility and raises doubts on the notion that central bank interventions through changes in reserves may significantly mitigate exchange rate swings. This is one of the research papers that is contrary to popular knowledge, the analysis suggests that international reserves and exchange rate movements in the instance of Peru are not closely related. The results of the study demonstrate the limitations of reserve-based programs to combat exchange rate volatility.

“The dynamic relationship between real exchange rates, real interest rates and foreign exchange reserves: empirical evidence from China” of (Narayan & Smyth, 2006) research on the dynamic relationship between real exchange rates, real interest rates, and foreign exchange reserves in China finds a significant and positive relationship between foreign exchange reserves and real exchange rates over the long term, indicating that China's foreign exchange reserves have a positive effect on the value of its currency. However, the authors discover no substantial association between foreign exchange reserves and real exchange rates in the short term, indicating that the impact of foreign exchange reserves on the value of China's currency is not instantaneous. The study also identifies a negative association between real interest rates and real exchange rates in both the short and long run, suggesting that higher real interest rates result in a depreciation of China's currency. The findings have significant implications for Chinese policymakers attempting to manage their foreign exchange reserves and stabilize their currency in a rapidly changing global economy.

2.4. Research Gaps

Nonetheless, the aforementioned studies still have research gaps; this paper will discuss addressing some of these difficulties.

Limited research on the relationship between international reserves and foreign exchange rates in specific countries, such as Vietnam: Despite the importance of foreign exchange rates and international reserves, there is a lack of research on individual country experiences. Existing studies tend to focus on broad trends that may not capture unique challenges and opportunities.

Lack of empirical analysis on the effectiveness of international reserves in managing exchange rate volatility, particularly in emerging market economies: While international reserves are seen as important for managing exchange rate volatility, there is limited empirical evidence on their effectiveness in emerging markets. This gap may hinder policymaker decisions on the appropriate levels and uses of international reserves.

Limited research on the optimal level of international reserves for specific countries, including Vietnam: There is a lack of research on the optimal level of international reserves for specific countries, which could make it difficult for policymakers to determine appropriate reserve levels for economic growth and stability.

Limited analysis on the impact of global shocks on the relationship between international reserves and foreign exchange rates in emerging market economies: There is limited research on how global shocks affect the relationship between international reserves and exchange rates in emerging markets like Vietnam, making it difficult for policymakers to adjust reserve holdings in response.

Limited research on the role of corruption in the relationship between international reserves and economic growth, and its potential impact on exchange rates: Corruption can affect economic growth and development, but there is limited research on its role in the relationship between international reserves and exchange rates. This gap may make it difficult for policymakers to identify and address corruption-related challenges to effective reserve management.

Lack of analysis on the relationship between capital controls and international reserves accumulation, and their impact on exchange rates: There is a lack of research on how capital controls affect international reserves accumulation and exchange rates, making it difficult for policymakers to determine the appropriate mix of policies to manage exchange rates and external shocks.

Limited research on the effectiveness of different monetary and exchange rate policies in managing international reserves and exchange rates in emerging market economies: There is a lack of research on how different policies work in specific contexts like emerging markets, which may make it difficult for policymakers to identify the most effective policies for managing exchange rates and external shocks.

3. RESEARCH METHODOLOGY

3.1. Research hypothesis

Hypothesis 1: Exchange rate have the significant impact on Foreign Reserve rate

Nominal exchange rate

H0: Nominal exchange rate have the significant impact on Foreign Reserve

H1: Nominal exchange rate does not have the significant impact on Foreign Reserve

Real exchange rate

H0: Real exchange rate have the significant impact on Foreign Reserve rate

H1: Real exchange rate does not have the significant impact on Foreign Reserve

3.2. Data sampling and variables

We collect data through Ceicdata.com. The data is collected and stored in the form of Excel File with data being collected quarterly from the first quarter of 1995 to the third quarter of 2022. There are a total of 111 examples for each variable type. In our report, the collected data variables include the Nominal exchange rate of Vietnam, Foreign reserve of Vietnam and CPI of Vietnam and America in order to calculate real exchange rate by using the following formula (Cuong, Ngoc, Mai, & Linh, 2013):

$$RER_{VND/CUR,t} = e_{VND/CUR,t} \times \frac{CPI_{VND,t}}{CPI_{CUR,t}}$$

Where:

$RER_{VND/CUR,t}$ The real exchange rate between VND and currency of country j in year t

$e_{VND/CUR,t}$ The nominal exchange rate between VND and currency of country j in year t

$CPI_{VND,t}$ The consumer price index of Vietnam in year t

$CPI_{CUR,t}$ The consumer price index of country j in year t

3.3. Data analysis

Using Stata 16, we will do the following data analysis steps: (1) Initially, descriptive statistics were employed to offer an overview of the data; (2) subsequently, an Augmented Dickey-Fuller test was conducted to determine the presence of unit roots. Based on the findings of the unit root test, (3) we will choose the model to run our data, and we discovered that the Johansen model is appropriate for our study, (4) finding the optimal lag length for each scenario and (5) run the Johansen test. The result show that there are no cointegration, so (6) we will use the Vector Autoregressive (VAR) model for the first difference to determine short-term impact of the variables. Finally, (5) we applied the diagnostic test to guarantee the model's reliability.

THE IMPACTS OF INSTITUTIONS, KNOWLEDGE AND GEOPOLITICAL RISKS ON THE DEVELOPMENT OF RENEWABLE ENERGY

**Author: Nguyen Thanh Huong¹, Vu Thi Van Anh¹, Luu Ngoc Huyen¹, Nguyen Thi Minh Ly¹
Mentor: Chu Khanh Lan¹**

ABSTRACT: Energy security is becoming a pressing problem for both developed and developing countries. Renewable energy can be considered as a potential solution to this problem. However, there are few studies examining differences in the combined impacts of three factors: institutions, knowledge and geopolitical risks on the development of renewable energy in the number of countries. Therefore, this study explores the influence of institutions, knowledge and geopolitical risks on renewable energy in 38 countries (23 high-income countries and 15 middle-income countries) in the period 2002-2020 through the quantile regression estimation method. The results show that institutions, knowledge, geopolitical risks, CO2 emissions, GDP per capita and oil prices have heterogeneous effects on renewable energy across high-income and middle-income countries. Notably, geopolitical risks also have a moderating impact on the influence of institutions and knowledge on renewable energy.

Key words: renewable energy, institutions, knowledge, geopolitical risks, high-income countries, middle-income countries.

1. INTRODUCTION

To solve the problem of environmental pollution, many treaties and regulations have been made and signed to reduce the amount of pollutant emissions, such as the United Nations Framework Convention on Climate Change, the Kyoto Protocol,... However, rapid population growth with an increasing demand for energy, has made it more challenging to limit energy consumption to reduce pollution. In order to solve these issues, governments have turned to renewable energy, which is said to be more abundant and environmentally friendly than traditional energy. Moreover, it also meets energy demand when political conflicts take place in the world.

To measure the development of renewable energy, the production index is considered the most popular, because it represents the status of these sources in the most accurate and clearest way. According to statistics from BP Statistical Review of World Energy, the past 20 years have witnessed a sudden increase in renewable energy production, especially in 2020 when this figure has exceeded 30 Exajun (EJ). Reports also show that the scarcity of clean energy has become more intense than ever. The group of high-income countries has always dominated in renewable energy because of the advantages of stable and developed economies. However, by 2010, a significant increase in gross output helped middle-income countries surpass the economic powers.

Solving the problem of energy security of countries is not simple because there are many factors that directly affect it. Some previous studies have mentioned the factors influencing clean energy consumption and generation such as Bourcet (2020), Can Şener et al (2018) and Darmani et al (2014) introducing the economic, environmental, energy, regulatory and demographic factors. However, the macro-environmental factors such as institutions, knowledge, especially geopolitical threats are quite new factors and are rarely mentioned when researching on this issue. Especially in the current context of geopolitical risks and fluctuations in world oil prices, these macro factors have a great influence on the participation of countries in the development of renewable energy. In general, the group of high-income countries possesses higher indicators of institutions, knowledge and geopolitical risks than the group of middle-income countries.

1 Banking Academy.

Regarding institutions, high-income countries often have better institutions, however, their quality is on a downward trend while institutions in middle-income countries are gradually improving. In terms of knowledge, despite the higher economic complexity index of the high-income group, the gap between these two groups is narrowing when the middle-income group experiences an incredible growth in this index and contribution to the renewable sector also increases significantly. Regarding geopolitical risks, although high-income countries have a higher level of instability than middle-income countries, the common point in both groups is that this index tends to decrease. The overview shows that high-income countries have a better institutional environment, higher levels of economic complexity, but are subject to more geopolitical risks. In addition, middle-income countries are making great efforts in both institutional policy and technological research to close the gap and transform themselves to the top. As a result, studying the impact of factors: institutions, knowledge and geopolitical risks on the development of renewable energy will help provide a scientific basis for theory and practice, thereby, provide highly reliable assessments of impacts as well as recommendations to promote further development. The results of the study are expected to add to the ongoing research on the influence of three factors including institutions, knowledge and geopolitical risks on renewable energy development, which is the basis to make appropriate policies for high and middle-income countries. The contents below are structured as follows: (2) theoretical framework, (3) research method, (4) results and discussion, (5) conclusion.

2. THEORETICAL FRAMEWORK

During the past two decades, there have been a number of studies examining the influence of factors on renewable energy using different models, measurements and estimation methods. Some common economic factors in the studies can be mentioned as: economic growth (Zboli et al, 2010), income (Omri et al, 2022; Shafiei and Salim, 2014), economic complexity index (Ahmad et al, 2021), FDI (Sarker et al, 2016). Besides, three factors related to macro-environment like institutions, knowledge and geopolitical risks have also been shown to have a significant impact on renewable energy in a number of studies.

Institution and renewable energy. “Institution can be what forms the orderly framework for human relations, locates the enforcement mechanism and limits the relationships between the interacting parties. It is also the common will of the social community in setting orders, rules, constraints, and shared norms and values” (World Economic Forum-WEF). Institutions have direct and indirect influences on the development of renewable energy through the promulgation of regulations and policies; tax reduction and discount; policies to promote international integration and attract investment. According to Oluoch et al (2021), institutions play an important role in making the renewable energy market more attractive. Omri et al (2022) also argue that institutions help to formulate appropriate policies to encourage the development of renewable energy. Similarly, Wang et al (2022) concluded that “institutional quality and geopolitical risks have a significant impact on renewable energy consumption”. In addition, the study also shows that policies to support investment in renewable energy are also a vital factor to increase renewable energy consumption in these countries. Saidi et al (2018) argue that “MENA countries with better institutional quality tend to use renewable energy to a greater extent and have better economic growth”. Moreover, Filimonova et al (2021) also demonstrated that institutions are an important factor in raising the renewable energy consumption in Europe.

Knowledge and renewable energy. The Economic Complexity Index (ECI) represents a country’s qualitative productivity based on research and development to produce more sophisticated and advanced outputs, using energy efficiently and dependent on less polluting technologies. In particular, knowledge can explain the differences in development between countries (Mealy et al, 2018). Factors of economic complexity in a country including “knowledge, skills, knowledge diversity and popularity” have different effects on clean energy deployment. Theoretically, it is expected that the diffusion of environmentally related technologies will promote clean energy (Chu, 2022; Khan et al, 2021; Wang and Wei, 2020; Wang

et al, 2022). Many researches have affirmed the essential role of research and development in stimulating innovation (Bointner, 2014). In addition, Subtil Lacerda and van den Bergh (2020) have shown a significant positive influence of external knowledge in both solar and wind energy. Irandoust (2018) finds that among the four Nordic countries, technological innovation impulses renewable energy consumption in Denmark and Norway, while in Sweden and Finland, the level of renewable energy consumption drives innovation in technology. On the other hand, modern technology-based products may not increase, or even reduce the level of renewable energy development. This is explained by the “recovery effect”-a phenomenon when energy efficiency increases can lead to less energy savings than expected (Gillingham et al, 2016; Gu et al, 2019; Lin and Liu, 2012).

Geopolitical risks and renewable energy. The geopolitical risks index reflects the risks associated with terrorist attacks, wars and tensions between countries that affect their international relations Caldara and Iacoviello (2022). This index was built based on a monthly geopolitical risks history index of countries dating back to 1900. We found that available literature on the relationship between geopolitical risks and renewable energy is still quite scarce. Sweidan (2021a, b) argues that geopolitical risks persuade countries to be more independent on fossil fuels. Sarker et al (2023) explore the asymmetric effects of geopolitical risks, crude oil prices and climate policy level uncertainty on the volatility and returns of clean energy prices in the United States. As a result, geopolitical risks have a crucial effect on clean energy prices in the long and short term. Similarly, Alsagr and van Hemmen (2021) also find a positive effect of geopolitical risks on renewables. Recently, Zhang et al (2023) showed that there is a temporal heterogeneity between geopolitical uncertainty and funds devoted to clean energy development. However, Flouros et al (2022) argue that geopolitical risks have a negative impact on renewable energy production regardless of the estimator used.

Research gaps. Nowadays, a lot of researches examine the influence of factors on renewable energy. However, there are few studies that consider the relationship between the three factors including institution, knowledge, geopolitical uncertainty and renewable energy. Those studies have little agreement on how these factors influence the development of renewable energy. This is due to differences in research methods and sampling methods. In terms of sampling, some studies examine renewable energy development on a global basis while others focus on regions or groups of countries. Regarding research methods, the authors choose different indicators to represent the influencing factors and apply many different methods to obtain similar and different results. These controversial results spread across all factors. Literature review reveals that there are no previous studies that have examined the combination of important explanatory factors such as institutions, knowledge and geopolitical risks when control variables are present in a model. This paper will provide important insights into how these variables impact renewable energy. We also compare the effect of each factor on renewable energy in both high and middle-income countries at the same time. Methodologically, quantile regression estimation analysis is a valuable to the literature because the previous literature mainly applied mean-based evaluation. It can show the impact of each variable on the renewable energy variable at different percentiles of the renewable energy variable rather than just based on the mean. This method is useful because it helps to clarify the influence of important factors on renewable energy.

3. RESEARCH METHOD

3.1. Research method

The study uses quantitative research methods based on quantile regression introduced by Powell (2022). The study builds two equations as follows:

Model (1) includes independent variables: institutions, knowledge, geopolitical risks; together with three control variables: CO2 emissions, income, oil price.

$$RENC_{i,t} = \alpha_0 + \alpha_1 \cdot INS_{i,t} + \alpha_2 \cdot ECI_{i,t} + \alpha_3 \cdot GPR_{i,t} + \alpha_4 \cdot CO2_{i,t} + \alpha_5 \cdot GDP_{i,t} + \alpha_6 \cdot OP_{i,t} + \varepsilon_{i,t} \quad (1)$$

Model (2) is expanded with two new variables, we use to examine the regulatory impact of geopolitical risk on the relationship of institutions, knowledge and renewable energy.

$$RENC_{i,t} = \alpha_0 + \alpha_1 \cdot INS_{i,t} + \alpha_2 \cdot ECI_{i,t} + \alpha_3 \cdot GPR_{i,t} + \alpha_4 \cdot GPR_{i,t} \cdot INS_{i,t} + \alpha_5 \cdot GPR_{i,t} \cdot ECI_{i,t} + \alpha_6 \cdot CO2_{i,t} + \alpha_7 \cdot GDP_{i,t} + \alpha_8 \cdot OP_{i,t} + \varepsilon_{i,t} \quad (2)$$

In which, $RENC_{i,t}$ is the output of renewable energy produced by country i at time t ; $CO2_{i,t}$ is the norm of $CO2$ emissions from energy of country i at time t ; $GDP_{i,t}$ is the per capita income of country i in year t ; $OP_{i,t}$ is the oil price of country i at time t ; $ECI_{i,t}$ is the economic complexity of country i in year t ; $GPR_{i,t}$ is the geopolitical risk of country i at the time t ; $INS_{i,t}$ is the institutional average of country i in year t . Some of the fixed-effects variables that control the model we used include: $CO2$ emissions, GDP per capita and crude oil prices. Besides, i is the unobserved country-specific effect and $\varepsilon_{i,t}$ is the residual.

Table 1. Expected signs of variables built in the model.

Variable	Symbol	Expectation sign	Research supports
Geopolitical risk index	GPR	+/-	Alsagr and Hemmen (2021), Cai and Wu (2021), Khan et al (2021), Sweidan (2021a, b), Sarker et al (2023), Strunz et al (2016), Wang et al (2022)
Economic complexity index	ECI	+	Bointner (2014), Hille et al (2020), Li and Shao (2021), Lin and Chen (2019), Lin and Zhu (2019), Nicolli and Vona (2016), Lacerda and Bergh (2020)
Institutional average	INS	+/-	Filimonova et al (2021), Oluoch et al (2021), Omri et al (2022), Rahman and Sultana (2022), Wang et al (2022)
Moderation of geopolitical risks to institutions	GPR.INS	+/-	
Moderation of geopolitical risk to economic complexity	GPR.ECI	+/-	

3.2. Research data

This study focuses on assessing the institutional, intellectual, and geopolitical risks affecting renewable energy development in 38 countries. Based on the availability of data, the study used secondary data of 23 high-income countries and 15 middle-income countries for the period 2002-2020.

4. RESULTS AND DISCUSSION

4.1. Preliminary test results

Cross-sectional dependence test

The results from Appendix 3 show that the cross-sectional dependence test has enough evidence to strongly reject the null hypothesis that there is no interdependence between countries in the data series (except for the ECI variable in middle-income countries). This result requires tests for the stationarity of the data.

Unit Root Test

The second-generation unit root test developed by Pesaran (2007) is applied. Appendix 4 shows that while the problem of unit roots persists among variables at the level (except for GPR), the first difference conversion makes these variables stop.

Co-integration Test

Results from co-integration tests by Kao and Pedroni (1999, 2004), Westerlund (2005) are shown in Appendix 5. The results of Kao and Pedroni test (1999, 2004) confirm the cointegration between variables. Similarly, the results of the Westerlund test (2005) confirm the long-run relationship of the variables. The

finding acknowledges that INS, ECI, GPR and other control variables maintain a cointegration relationship on RENC in the study countries.

4.2. Main results and discussion

This section discusses the panel quantiles regression results of Powell’s data analysis (2022). To comprehensively investigate the impact of institutions, knowledge, geopolitical risks and other important aspects on the development of renewable energy, we use nine percentiles (10th-90th). The results obtained are related to equation (2) and equation. (3) are presented in **Tables 2 and 3** respectively.

The results of **Table 2** show the various effects of variables on the renewable energy’s consumption generated in high and middle-income countries.

Institutions. In the group of high-income countries, the estimated coefficient of institutions is statistically significant at all percentiles. Institution has a positive effect on renewable energy in the 10 to 70 percentile,

but shows a negative effect in the upper quartile (groups 80 and 90). As institutional quality improves, the government will focus its resources on promoting renewable energy development (Oluoch et al, 2021; Omri et al, 2022; Wang et al, 2022). However, when countries reach a stage where renewable energy production and consumption is high, institutions have an adverse effect. In the group of middle-income countries, the estimated coefficients are generally low, significantly smaller than in the group of high-income countries, indicating that the institution has little impact on renewable energy in the group of middle-income countries.

Knowledge. In the context of high-income countries, the estimated coefficient of knowledge (ECI) is obtained as positive and statistically significant at the 1% level in all percentiles, with increasing influence from subgroups. position 10 to 40, then gradually decrease from the 50 to 90 percentiles. The results show that knowledge has a positive effect on helping countries have more opportunities to develop renewable energy. Research by Elia et al (2021), Khezri et al (2021) agrees with this finding. In the group of middle-income countries, there is an inconsistent relationship between knowledge progress and renewables. The affection of economic complexity on renewables is not large and unfavorable, and varies across percentiles. The upgrade in economic complexity reduces renewables in the 30th and 40th quantiles but promotes renewables in the remaining quantiles. The estimated coefficient is significant only at the 10th, 20th, 80th and 90th percentiles.

Geopolitical risks. Geopolitical instability has both positive and negative associations with renewable energy expansion in both groups of countries. However, in the group of high-income countries, the effect is quite small across the percentiles. Although it remains the main driver of green energy expansion in middle-income countries, its effect gradually becomes negative in the following quintiles. The negative effect of geopolitical instability is most pronounced at the 60th percentile, then gradually decreases at the 80th and 90th percentiles. In countries that are in the early stages of renewable energy development, geopolitical risks make a positive and significant effect on clean energy expansion, but the effect turns negative as countries reach a high level of renewable energy development. This finding is consistent with the results of Flouros et al (2022) who say that geopolitical risks have an adverse effect on renewable energy production regardless of the estimator used.

CO₂. The results demonstrate that the level of CO₂ emissions has a positive impact on the development of renewables in both groups. In the group of high-income countries, the coefficient is statistically significant and positive in all percentiles. Thus, when the environmental quality worsens, air pollution will promote the evolution of renewables. For the group of middle-income countries, except for the 10th percentile, the remaining percentiles are positive and statistically significant. When environmental pollution occurs, middle-income countries are forced to develop renewable energy or use traditional energy, despite the deterioration of environmental quality. This result is consistent with the conclusion of Apergis and Payne (2014), Sadorsky (2009) that CO₂ emission is a contributing factor to enhance the evolution of renewable energy in G7 and OECD countries.

Income per capita. GDP has a different effect on the development of renewables, the impact of which is meaningfully greater in high-income countries than in middle-income countries. In the group of high-income countries, increasing income promotes renewable energy extension in all quintiles, but discourages renewable energy in more than half of the percentiles in the middle-income group. The fact that renewable energy benefits when average income increases has been found by many authors (Abanda et al., 2012; Apergis and Payne, 2014; Przychodzen and Przychodzen, 2020; Vural, 2021). For middle-income countries that have not yet developed renewable energy, when energy demand increases due to economic growth, renewable energy cannot be developed in time to meet the needs of more traditional energy use.

Oil prices. The coefficients calculated show a favorable correlation between oil prices and renewables. Oil and renewable energy are two substitute goods, so when the price of one good increases, it will stimulate people to use the other good. This is clarified in the papers of Bamati and Raoofi (2020), Brini et al (2017),

Gozgor et al (2020). Rising oil prices also make renewables more commercially viable, stimulating renewable energy investment, production and use (Chu, 2022). In addition, the correlation coefficient between the oil price and renewable energy in the two groups of countries gradually decreases towards the higher quantiles, indicating that the more renewable energy and energy infrastructure develop, the less sensitive developed countries become to oil price fluctuations.

Table 3 shows the effect of variables on renewables consumption in the case of a geopolitical risk moderator on the relationship of institutions, knowledge and renewable energy.

Table 3. Quantile regression model results-In case of moderator variable.

The interaction effect between geopolitical risks and institutions to renewable energy. The estimated results demonstrate that in terms of geopolitical uncertainty, institutions have a positive effect on the development of renewables, but the effect is much larger in middle-income countries. The estimated coefficients are positive and meaningful at all percentiles. Geopolitical risks have a moderating effect on the role of institutions in renewables development. When there are geopolitical events, institutional improvement will play a very essential role in the development of renewables. This result is parallel to the conclusion of Filimonova et al (2021), they demonstrate that institutional factors are important in promoting renewable energy consumption in Europe. Khan et al. (2019) also analyzed legal and regulatory frameworks in 10 developing countries and found that lack of policy stability, poor regulation, and lack of financial support are among major challenges for renewable energy development in these countries.

The interaction effect between geopolitical risks and knowledge to renewable energy. In the case of geopolitical risks, knowledge has a different effect on the development of renewables, the effect of which is appreciably greater in middle-income countries. In the group of high-income countries, geopolitical risks that moderate the influence of knowledge on renewables are in the early stages of clean energy development. For countries that have reached a high level of renewable energy development, geopolitical risks no longer amplify the role of knowledge, but instead reduce its negative impact. This can be explained by Gillingham et al (2016); Gu et al (2019); Lin and Liu (2012), advanced technologies may not increase, or even reduce, the development of renewable energy because of the “recovery effect”. In the group of middle-income countries, the coefficients of the geopolitical risk modifier to knowledge are positive and significant at all percentiles. Geopolitical risks have a moderating effect on the impact of knowledge on renewable energy. The impact increases progressively from the 10-50 percentile and gradually decreases at the 60-90 percentile. Geopolitical risks have the effect of amplifying the influence of knowledge on renewable energy development. As geopolitical risks cause fluctuations in oil prices and disrupt fossil fuel supplies, the role of knowledge becomes important in the expansion of clean energy as knowledge advances help innovate modern technology to create renewable energy sources. Bointner (2014) also confirmed the role of research and development in renewable energy innovation.

5. CONCLUSION

In conclusion, the results show heterogeneity between the two groups of countries. Institutional influence on renewable energy in high-income countries is positive at the early stages of renewable energy development and negative when reaching a high level of development. For middle-income countries, the institutional impact on renewables is positive at all stages. Our research also shows interesting evidence of the influence of knowledge on renewable energy. Regarding high-income countries, the effect is the most widespread at the initial stage, then recovers and finally declines as higher levels of renewable energy development are reached. The impact on middle-income countries is the highest when it starts renewable energy generation, but it drops when reaching the two highest levels of development. With respect to geopolitical instability, in some high-income countries, it has a positive influence on the use of renewable energy while it is negative in most middle-income countries. Besides, geopolitical instability also has an indirect impact on renewable energy through institutions and knowledge. Firstly, geopolitical risks amplify the institutional influence on renewable energy expansion in high-income countries. However, for the group of middle-income countries, this amplification is not large and clear. Moreover, geopolitical risks also have the effect of amplifying the role of knowledge. When there is geopolitical instability, besides institutional quality, intellectual progress also plays an important role in renewable energy development in high-income nations. With middle-income countries, the amplifying impact of geopolitical risks on knowledge on renewable energy generation and consumption is much larger than in high-income countries.

The results suggest that both developed and emerging economies need to improve institutional quality and raise level of knowledge and control geopolitical risks. The following policies may be adopted.

i) Groups of countries need to actively improve institutions, implement incentive policies, prioritize clean energy, build a clear stable legal system and transparent investment environment to encourage investors to invest in renewable energy.

ii) All countries in two groups should expand knowledge and promote technological progress to develop clean energy. Additionally, nations dealing with high geopolitical risks should increase investment in renewable energy.

iii) In the context of geopolitical risks, the role of institutions becomes more important in diversifying renewable energy sources in high-income countries. Therefore, these countries should focus on improving the quality of institutions to facilitate renewable energy deployment. In contrast, knowledge is a strong driver for renewable energy in middle-income countries. Consequently, these countries should concentrate on expanding knowledge to create new renewable energy devices in the face of geopolitical instability.

This research also has some limitations. Firstly, limited data makes it impossible to capture the whole world picture. Second, previous research and this research mainly analyzed the macroscopic view that ignored the context and special factors of the cases. In the energy sector, future topics may shed light on the following directions. First, there is a need to extend the approach to the data sample worldwide. Second, a micro-level analysis that investigates each country’s clean energy structure and its drivers or a cross-country analysis of several types of renewable energy is important. Third, explore the long-term and short-term impacts of institutions, knowledge, and geopolitical risks on specific energy sources such as solar, wind, and hydroelectricity. In addition, it is also necessary to expand on elements such as culture, technology, finance and population.

APPENDIX

Appendix A. Country list

Sample	Country
High-income countries	Australia, Belgium, Canada, Chile, Denmark, France, Finland, Germany, Hungary, Italy, Israel, Japan, Netherlands, Norway, Poland, Portugal, Saudi Arabia, South Korea, Spain, Sweden, Switzerland, United Kingdom, United States
Middle-income countries	Brazil, China, Columbia, India, Indonesia, Malaysia, Mexico, Peru, Philippines, Russia, South Africa, Thailand, Turkey, Ukraine, Egypt

EVALUATING THE IMPACT OF THE IUU YELLOW CARD ON VIETNAM'S FISHERY EXPORT TO THE EU

**Author : Nguyen Tan Thinh¹, Nguyen Lan Anh¹, Nguyen Thi Mai Hien¹,
Doan Thanh Nam¹, Nguyen Thanh Trung¹
Mentor: An Nhu Hung¹**

ABSTRACT: *The Illegal, Unreported, and Unregulated Fishing (IUU) is a set of regulations enacted by the European Union (EU) to punish trade with countries that do not comply with the to prevent resource depletion. Vietnam got the IUU yellow card in October 2017 and it can lead to huge economic losses. The Vietnamese government immediately took specific guidelines and actions to remove the yellow card. And for the government to make decisions closer to reality, the article will provide perspectives on how the yellow card affects Vietnam's seafood exports. The objective of this study is to quantify the impact of the IUU yellow card on seafood exports to Europe after being tagged. With the above goal, we compared the difference between the two cases: the total export value to the EU of Vietnam in reality (with being yellow-carded) and Vietnam's counterfactual (without being yellow-carded). We use the Synthetic control method to build Vietnam's counterfactual. The results of the study indicate that: in the period from 2018 to 2021, Vietnam's fishing industry suffered about \$220 million in damage and about \$27 million in aquaculture losses compared to the case of Vietnam's counterfactual. This is the first research paper in the world to evaluate the impact of the IUU yellow card on export turnover to the EU.*

Keywords: *Seafood export, IUU yellow card, EU, Synthetic control method.*

1. INTRODUCTION

The fisheries sector is one of the important components of the Vietnamese economy. Starting from a natural economic activity, Vietnam's fisheries have risen to become an industrial-oriented activity with remarkable achievements. Vietnam's seafood export value has increased to 11 billion USD by 2022, accounting for 10% of total export revenue. Vietnam ranks 3rd among major seafood exporting countries in the world. Not only playing an important role in economic development, Vietnam's seafood industry also actively contributes to social security, helping to eliminate hunger and reduce poverty; creating more jobs for people. According to the General Statistics Office (2023), as of the fourth quarter of 2022, the number of employed workers in the agriculture - forestry - fishery sector is up to 14.1 million people, of which, the number of employees in the fisheries sector is more than 4 million.

The European Union market is considered an important market, always ranked second among the five major export markets for Vietnam's seafood industry. Vietnam's seafood industry has suffered negative impacts from the IUU yellow card since October 2017 due to illegal, unreported and unregulated (IUU) fishing. After the yellow card was imposed, this market immediately dropped to the 4th place, and at the same time, the export value of Vietnamese seafood to the EU market decreased. In 2019 - after two years of being yellow-carded, the total amount of seafood export value from Vietnam to the EU decreased by 14.7%, of which, the export value of the caught seafood group decreased by 17.86%. The yellow card also has a strong impact on Vietnam's seafood export activities: 100% of fishing vessels have to be traced, and border clearance is delayed... The removal of the IUU yellow card has therefore received serious attention and involvement from all levels of government from central to local.

Quantifying the impact of the IUU yellow card is of utmost importance for all seafood export countries in general and Vietnam in particular. There are currently only very few studies conducted in this direction, and only one study concerns the case of Vietnam.

¹ Banking Academy of Vietnam.

Rogers (2021) investigates the impact of the yellow card on Panamanian exports. The author concludes that the impact of the IUU yellow card on Panama's seafood trade is negligible since Spain and Portugal do not effectively restrict imports from Panama. They also cannot conclude that being tagged with the IUU will prevent Panama from fishing illegally. He believes that future studies with different research methods would estimate more clearly the impacts of IUU yellow cards on countries tagged by the EU.

Sumaila (2019) also finds the impact of the IUU regulation applied by the EU to the world is negligible, but if both the US and Japan impose the same measure, the impact of this regulation will be no small. If a country is red-carded, at the same time, as the EU is not their main export market, then that country does not necessarily continue to violate EU's requirements. If this is true, the EU's anti-IUU regulations may not induce severe reductions in that country's seafood export.

Focusing exclusively on Vietnam, Nam *et al.* (2021) assessed the impacts of the IUU yellow card on Vietnam's seafood industry through case studies such as yellow card in the case of Thailand, and red card in Sri Lanka. The report also highlights the importance of implementing management measures to improve maritime environmental sustainability and economic efficiency in the fishing industry.

All of the studies above have the same limitation when simply analyzing the impact of IUU yellow card by comparing export volume *before and after* the country is penalized, thus cannot exclude the differences in the economic context between the two periods. To assure that the causal impact of the IUU yellow card on a country's seafood exports can be assessed, in principle, it is necessary to compare that country's seafood exports in case of being yellow-carded with that without being yellow-carded. This study was carried out in the above direction to evaluate the causal impact of the IUU yellow card on seafood export in Vietnam.

The objective of this study is to empirically evaluate the impact of the IUU yellow card on the seafood export revenue of Vietnam from 2017 to the present. To assess the causal impact of the IUU yellow card, the Synthetic Control method was used to create a *counterfactual seafood export* for Vietnam if not yellow-carded, thereby comparing it with *the actual seafood export* of Vietnam to estimate the real impact caused by the yellow card. This is the first impact evaluation study related to the above topic to date. Our estimated results are expected to provide some new perspectives on policies to help management agencies make more comprehensive and accurate decisions regarding the sustainable development of the fisheries sector.

The remainder of this article is organized as follows. Section 2 provides a theoretical framework of the impact of IUU yellow cards on seafood exports. We will then present the research methodology used to estimate IUU yellow card damage in section 3. Based on the identified research methods, direct and indirect damage to Vietnam's seafood exports will be presented in section 4, from which practical policy implications could be drawn in section 5.

2. THEORETICAL FRAMEWORK

The EU applies a penalty system for countries with illegal fishing practices. The penalty system includes 3 levels: red card (highest penalty), yellow card (warning penalty) and green card (no penalty). Vietnam is being imposed a yellow card due to inadequate efforts to conform with IUU regulations. This yellow card could affect Vietnam's seafood exports through two main channels.

Direct impact

Since IUU regulations' goal is to completely ban illegally caught fisheries in the EU market, intuitively, the yellow card will have a direct impact on capture fishery importing to the EU. This impact is driven by the requirement that 100% containers of seafood exported to the EU from the country that is being subjected to the yellow card will be detained for originality inspection. This means that all exported seafood containers have to stay longer at the ports, which would incur higher time and financial costs for exporting companies, as well as inevitable seafood-quality deterioration. Thus, the yellow card directly

decreases Vietnam's export of captured fisheries. Lower revenue from fishery export makes life of hundreds of thousands of fishermen much harder, and also directly curtails the Government budget, not only in terms of export revenue losses but also in terms of yellow card removing costs.

Indirect impact

Beside the direct impact, the IUU yellow card indirectly affects the image, brand and reputation of Vietnam's seafood in the international market. In this sense, Vietnam's aquaculture products will also be affected. Statistics show that Vietnam's aquaculture exports have actually experienced a sharp fluctuation since the end of 2017 (Nam *et al.*, 2021). The main cause, however, may be due to factors other than the IUU yellow card alone, such as volatile market demand or seasonality.

The EU is a large and influential fisheries market globally, thus when the EU imposes a yellow card on Vietnamese seafood, other markets will also have a certain vigilance towards fisheries imported from Vietnam. To complicate the matter further, other markets might apply the same IUU regulation in order to strictly control the quality of imported fisheries, typically two important export markets of Vietnam, namely the US (from 2018) and Japan (from 2022). Vietnam's fisheries export to the US and Japan might face the same difficulties as the EU market.

The yellow card might also indirectly hamper Vietnam's foreign relations with the world. First, it might affect the relations between Vietnam and the EU, then it might negatively affect the expansion of Vietnam's relations with the world. The IUU yellow card prevents Vietnam's fisheries export from receiving all the tax cuts related to the EVFTA agreement.

3. METHODOLOGY

Estimation methods

This study aims at quantifying the impact of the IUU yellow card on Vietnam's seafood export revenue from 2017 to the present. To this end, the latest impact evaluation method called Synthetic Control Method (SCM) is employed here.

Synthetic Control Method (SCM) is an econometric tool developed by Abadie & Gardeazabal (2003) and later extended and popularized by Abadie *et al.* (2010), Abadie (2021). SCM seeks to create a synthetic control unit (i.e. the counterfactual, from all objects in the control group) for the object being affected by the event (or treatment unit), so that the difference in outcomes between the two groups could be estimated. The SCM counterfactual generating process is based on the similarity between the synthetic control unit and the treatment unit for a long period of time before the event occurs. This is done by taking the weighted average of the outcome of each individual object within the control group, as well as the weighted average of every variable affecting the outcome. As the counterfactual is not the outcome of only one control unit but is derived from all objects within the control group (thus "synthetic"), the method is named as Synthetic Control Method. Once the synthetic unit is formed, the actual outcome of the treatment unit is then compared with the simulated outcome of the counterfactual unit for the period after the occurrence of the event, and the difference between the two is interpreted as the causal effect of the event on the treatment unit.

This section quickly summarizes the idea of the SCM, based on the presentation of Abadie (2021).

Assume that there are $J+1$ objects and that the first object ($j=1$) is the one that receives the effect of the event (treatment unit) and the remaining J objects ($j = 2, \dots, j+1$) is the control group. Objects are observed in the time interval $t = 1, \dots, T$.

Denote:

$+ Y_{jt}^I$ as the outcome (for example, some economic results) of object j in time t in case the event under consideration has never happened, for object $j=1, \dots, J+1$, and $t=1, \dots, T$.

+ T_0 is the time at which the event occurs, T_0 is somewhere between 1 and T . Then, Y_{1t}^I will be the counterfactual outcome for object $j = I$ for time $t > T_0$.

+ Y_{1t}^I is the observed outcome for object $j = 1$ at time t .

+ During the period before the event ($t \leq T_0$), the event does not affect the economic outcome during this time, thus $Y_{1t}^I = Y_{1t}^N$ for all $t \leq T_0$.

+ After the event occurs ($t > T_0$), the event's impact on object $j = 1$ in year t is determined as follows:

$$\tau_{1t} = Y_{1t}^I - Y_{1t}^N \tag{1}$$

Since Y_{1t}^I is the outcome observed in reality, to calculate τ_{1t} , the counterfactual Y_{1t}^N needs to be estimated. To estimate Y_{1t}^N , Abadie et al. (2010) estimate the linear regression equation as follows:

$$Y_{jt}^N = \delta_t + \theta_t Z_j + \lambda_t \mu_j + \varepsilon_{jt} \tag{2}$$

In which δ_t is the time-invariant fixed effects, Z_j and μ_j are vectors of observed factors (and event-unaffected) and unobserved factors, respectively, and ε_{jt} is the error term.

Abadie et al. (2010) determine the vector ($J \times I$) of weights:

$$W = (w_2, \dots, w_{J+1}) \text{ with the condition that } w_j \text{ is non-negative} \tag{3}$$

$$\text{and } \sum w_j = 1 \text{ for } j=2, \dots, j+1$$

Each particular set of values of $W = (w_2, \dots, w_{J+1})$ creates a counterfactual value for the treatment unit. Outcomes for the synthetic control unit would be:

$$\sum_{j=2}^{J+1} w_j Y_{j1} = \delta_t + \theta_t \sum_{j=2}^{J+1} w_j Z_j + \lambda_t \sum_{j=2}^{J+1} w_j \mu_j + \sum_{j=2}^{J+1} w_j \varepsilon_{jt} \tag{4}$$

Assuming there exists a $W^* = (w_2^*, \dots, w_{J+1}^*)$ such that:

$$\begin{aligned} \sum_{j=2}^{J+1} w_j^* Y_{j1} &= Y_{11}; \\ \sum_{j=2}^{J+1} w_j^* Y_{j2} &= Y_{12}, \dots, \sum_{j=2}^{J+1} w_j^* Y_{jT_0} = Y_{1T_0}; \\ \sum_{j=2}^{J+1} w_j^* Z_j &= Z_1 \end{aligned} \tag{5}$$

Then the following value can be used as proxy for the impact of the event on the object $j = 1$:

$$\hat{\tau}_{1t} = Y_{1t} - \sum_{j=2}^{J+1} w_j^* Y_{jt} \tag{6}$$

In fact, it will be extremely difficult to find such vector $W^* = (w_2^*, \dots, w_{J+1}^*)$ that strictly satisfies all the conditions in equation (5) and (6). Instead, W^* are chosen so that all these conditions are partly satisfied by minimizing the following expression:

$$\min \|X_1 - X_0 W\|_v$$

$$\text{In which } \|X_1 - X_0 W\| = \left(\sum_{h=1}^k v_h (X_{h1} - w_2 X_{h2} - \dots - w_{J+1} X_{hJ+1})^2 \right)^{1/2} \tag{7}$$

Where k is the number of explanatory variables Z in Equation (2). X_1 is the vector of the explanatory variables Z combined with a linear combination of Y_{jt} ($j = 2, 3, \dots, j+1$) for the main object (the treatment unit), X_0 is the analogous vector for the objects within the control group. The non-negative vector $V = (v_1, v_2, \dots, v_k)$ acts as the coefficient of X_1, \dots, X_k .

Minimizing $\|X_1 - X_0W\|$ also means that the Root Mean Squared Percentage Error (RMSPE) is minimized.

$$\sum_{t=1}^{T_0} (Y_{1t} - w_2(V)Y_{2t} - \dots - w_{j+1}(V)Y_{j+1t})^2 \quad (8)$$

The expression to calculate the deviation ratio is expressed together as follows:

$$\frac{\text{RMSPE}}{Y_{1t}}; t=1, \dots, T_0 \quad (9)$$

Application to the case of Vietnam

The procedure explained above is then applied to our specific case as follows.

Suppose that there are $J + 1$ countries which exports fishery products (either captured or farmed) to the EU market, in which only $j = 1$ refers to Vietnam, the only country that is being imposed a yellow card from the EU. Vietnam acts as the treatment unit. The remaining J countries form the control group. Our time period spans from 2005 to 2021, and the year 2017 marks the occurrence of the event (i.e. $T_0 = 2017$, this is the year the EU's yellow card was first imposed on Vietnam captured fisheries).

The outcome in this case is countries' fishery export revenue to the EU market. Since the IUU yellow card may induce both direct and indirect impact on fishery exports, we decompose fishery export into two parts corresponding to the two impacts as follows:

Y_1 - Total value of captured fishery exports to the EU market.

Y_2 - Total value of aquaculture exports to the EU market.

The main explanatory variables (i.e. Z variables in Equation 3.2) are selected on the basis of the structural gravity model prevailing in international trade literature, including:

- + Country's total fishery export revenue (from exporting to the whole world), representing its export capacity.

- + The EU's total fishery import value, representing its import demand;

- + Geographic distance from the exporting country to the EU; proxy for the bilateral trade cost between them;

- + Import duties imposed by the EU on imported fishery (%), also proxy for the bilateral trade cost between the exporting country and the EU.

Our sample includes firstly all countries that export fishery to the EU market. From this initial sample we then select countries whose fishery exports to the EU tend to rise over time, similar to the trend observed in the case of our treatment unit. Most importantly, to be included in the control group, these countries must not be imposed yellow cards by the EU before and after 2017. Our final sample consists of 20 countries.

Data for exporters' total value of captured fishery exports (Y_1) and aquaculture (Y_2) to the EU market, exporters' total fishery exports, the EU's total fishery imports are compiled and calculated from raw trade data extracted from the International Trade Center (ITC). In many cases data is extracted from the United Nations Commodity Trade Statistics Database (UN Comtrade) instead of ITC due to data unavailability. Geographic distances (in terms of km) were extracted from the Gravity dataset developed by the Center d'Études Prospectives et d'Informations Internationales (CEPII). Import tariffs on fishery products are compiled based on the Tariff Analysis Online tool provided by the World

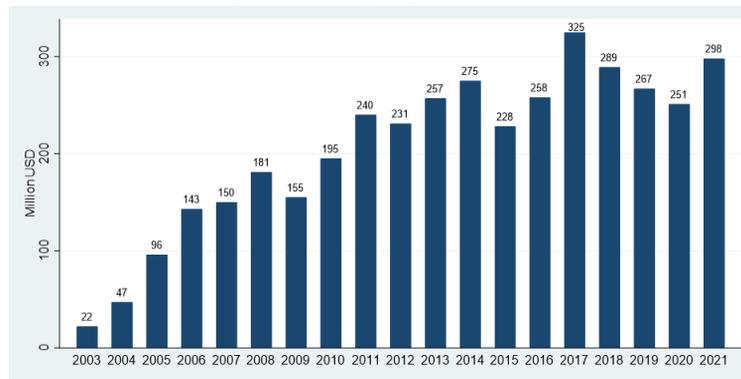

Trade Organization (WTO).

4. ESTIMATION RESULTS

Vietnam’s fishery exports to the EU

With suitable geographical and climatic conditions, Vietnam has become one of the major fishery producing countries in the world with a total fishery production of 8.73 million tons in 2021. Currently Vietnam is the third largest fishery exporter worldwide. Major import destinations of Vietnam fisheries are the EU, the US, Japan and China.

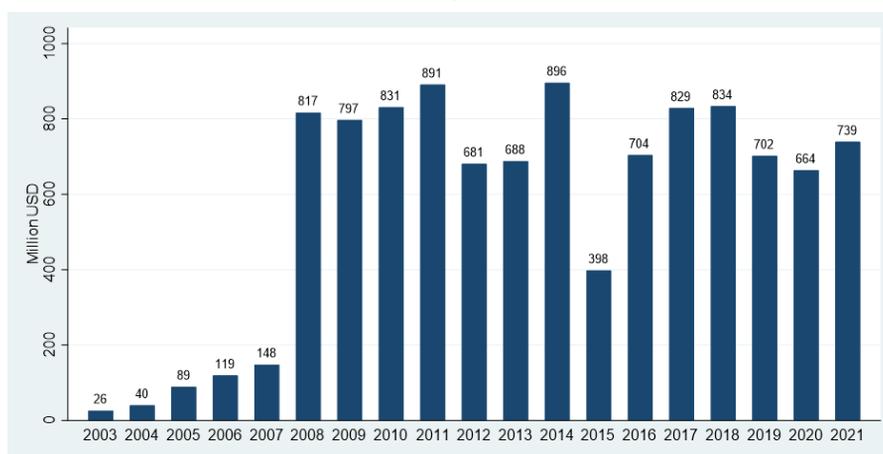

Figure 1. Vietnam’s total captured fishery export to the EU 2003 - 2021 (million USD)

Source: authors’ calculation

The IUU yellow card seems to have no direct impact on aquaculture exports. The total value of aquaculture exports still increased from 829 million USD in 2017 to 834 million USD in 2018. This value decreased slightly since then, to 702 million USD in 2019 and to 664 million USD in 2020. The decreasing trend was reversed in 2021 when aquaculture exports bounced back to 739 million USD.

Figure 2. Vietnam’s total aquaculture fishery export to the EU 2003 - 2021 (million USD)

Source: authors’ calculation

Impact of the IUU yellow card on Vietnam’s fishery export to the EU

This section reports estimation results for the impact of the IUU yellow card on Vietnam’s fishery export to the EU based on the Synthetic Control Method.

Regarding captured fisheries

Figure 3 and 4 show the output results after implementing the SCM method with our input data relating to the captured fishery exports.

Figure 3. SCM weights for countries (for captured fisheries)

Third Step: Obtain Results

Loss: Root Mean Squared Prediction Error

RMSPE	21692.72
-------	----------

Norway	0
Portugal	.019
Spain	.26
USA	0
United Kingdom	.063

Source: authors' calculation

$$\begin{aligned}
 &Y_1(\text{VietNam Synthetic}) \\
 &= 0.12 \times Y_1(\text{Belgium}) + 0.427 \times Y_1(\text{India}) + 0.021 \times Y_1(\text{Italy}) + 0.09 \times Y_1(\text{Netherlands}) \\
 &+ 0.019 \times Y_1(\text{Portugal}) + 0.26 \times Y_1(\text{Spain}) + 0.063 \times Y_1(\text{UK})
 \end{aligned}
 \tag{10}$$

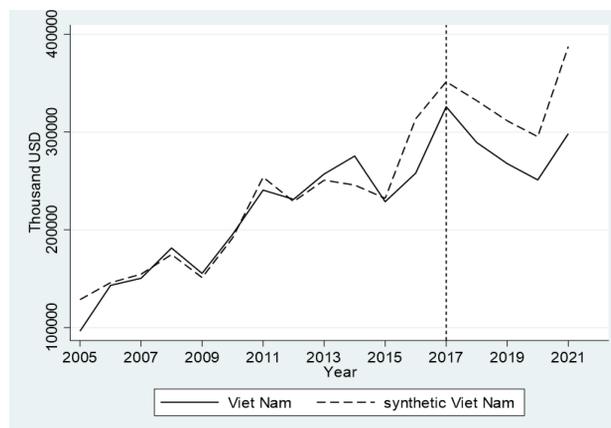

RMSPE = 21692.72 means that the original mean squared prediction error, or more simply the average deviation from Vietnam’s counterfactual total export value of the captured fishery to the EU to that of actual Vietnam is about 21 million USD over the period 2005 - 2017. This also means that our model accuracy ratio is about 90%.

From the above weights, we come up with the main result shown in Figure 4. The results show that the negative impact of the IUU yellow card on the export of caught seafood is quite significant.

Vietnam’s counterfactual export revenue (to the EU) for captured fisheries tends to fluctuate quite similarly to the actual one before 2017. These two series almost completely coincide in terms of value for the whole period from 2006 to 2013. They only fluctuated differently at one point in time, which was in 2014, when the actual value of captured fisheries export from Vietnam to the EU 27 tended to increase while the simulated one tended to go in an opposite direction.

Figure 4. Vietnam’s actual and counterfactual captured fishery export revenue to the EU

(in thousand USD)

Source: authors' calculation

All the above statistics confirm that our model could fairly reliably quantify the impact of the IUU yellow card on captured fisheries export to the EU from Vietnam, by taking the difference between the actual Vietnam’s captured fishery export revenue and Vietnam’s counterfactual. Figure 5 and Table 1 report this results.

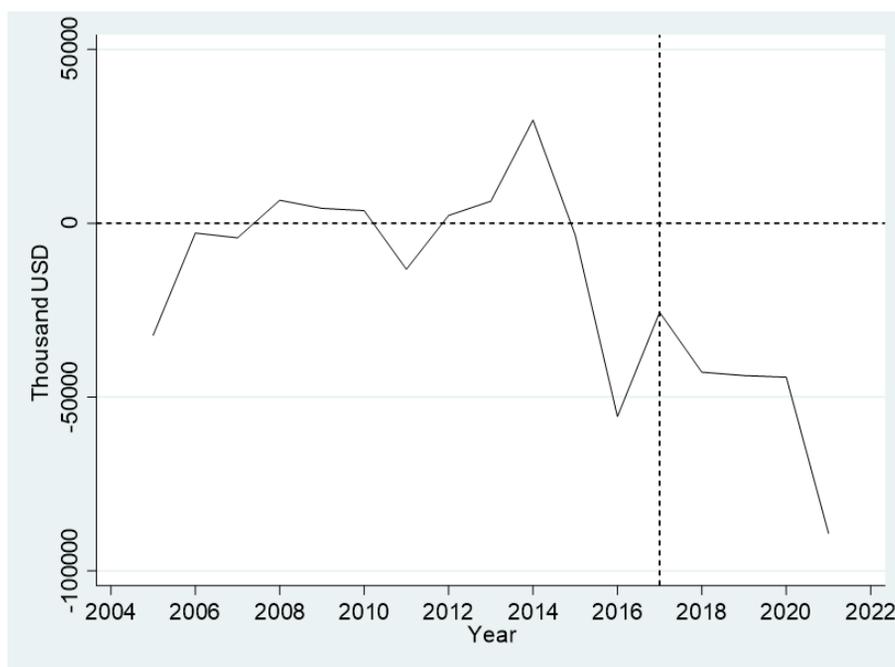

Figure 5. The difference between the actual and counterfactual Vietnam’s captured fishery export revenue (in thousand USD)

Source: authors’ calculation

Table 1. The difference between the actual and counterfactual Vietnam’s captured fishery export revenue 2018-2021 (in thousand USD)

Year	Vietnam’s exploited seafood	Vietnam’s counterfactual caught seafood	Difference	The accuracy rate of estimation	RMSPE
2018	289404	332223	-42819	90%	21692.72
2019	267789	311594	-43805		
2020	251100	295377	-44277		
2021	298410	387603	-89193		

Source: authors’ calculation

Conclusion: The IUU yellow card has caused quite significant damage to Vietnam’s exports of caught seafood to the EU. The accumulated total loss from 2018 to the end of 2021 is about 220 million USD, which accounts for nearly 20% of the whole of Vietnam’s captured fishery export to the EU 27 during this period.

Regarding aquaculture products

First the weights attaching to each country are estimated. Figure 6 reports the results.

Figure 6. SCM weights for countries (for aquaculture products)

RMSPE	221013.4
-------	----------

Unit Weights:	
Co_No	Unit_Weight
Argentina	0
Belgium	0
Chile	0
China	.299
Denmark	0
Ecuador	.701
France	0
India	0

Norway	0
Portugal	0
Spain	0
USA	0
United Kingdom	0

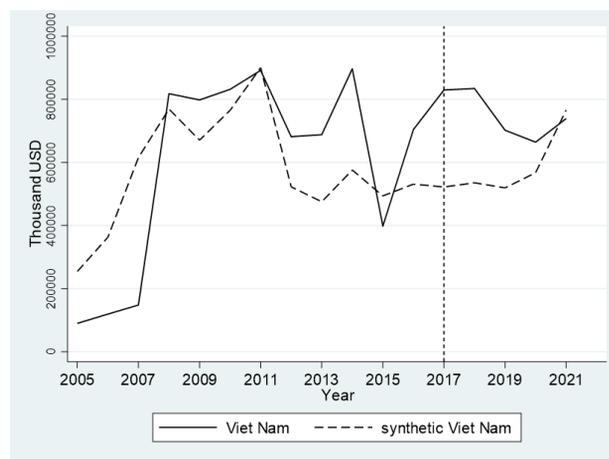

Source: authors' calculation

$$Y_2(\text{VietNam Synthetic}) = 0.299 \times Y_2(\text{China}) + 0.701 \times Y_2(\text{Ecuador}) \tag{11}$$

RMSPE = 221013.44 shows that the difference between Vietnam’s counterfactual’s total export value of aquaculture products to the EU compared with the actual one during the period 2005 - 2017 is about 221 million USD.

From those weights, we estimate the counterfactual for Vietnam aquaculture exports to the EU 2005-2021 and display them along with the corresponding actual value in Figure 7

Figure 7. Vietnam’s actual and counterfactual aquaculture export revenue to the EU (in thousand USD)

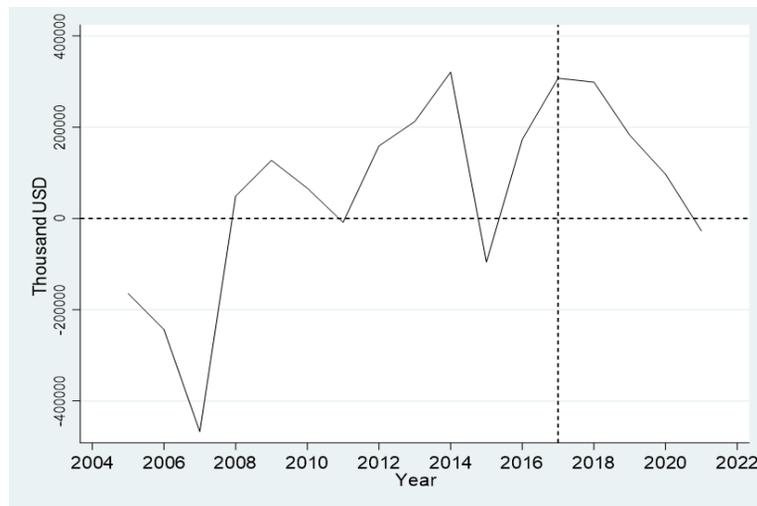

Source: authors' calculation

As can be seen from Figure 7, the simulated numbers (synthetic Vietnam) resemble quite closely to the actual figures. However, the overlapping degree between these two series during the period 2005-2017 was not very high since there are very few countries that show many similarities to Vietnam regarding aquaculture exports to the EU, both in terms of value and fluctuation tendency.

Difference between counterfactual and real export value:

Figure 8. The difference between the actual and counterfactual Vietnam’s aquaculture fishery export revenue (in thousand USD)

Source: authors’ calculation

Figure 8 shows the difference between Vietnam’s actual and counterfactual aquaculture fishery export to the EU for the period 2005-2021.

With an RMSPE of around 221013, we could calculate a deviation rate of 36% or a similarity rate of reasonably high at 64%. With the above accuracy, we quantify the impact of the IUU yellow card on Vietnam’s aquaculture exports as the difference between the actual Vietnam’s aquaculture exports revenue to the EU and its counterfactual over the 201-2021 period. The results are shown in Table 2.

Table 2. The difference between the actual and counterfactual Vietnam’s aquaculture export revenue 2018-2021 (in thousand USD)

Year	Vietnam’s farmed seafood	Vietnam’s counterfactual farmed seafood	Difference	The accuracy rate of estimation	RMSPE
2018	834382	535512	298870	64%	221013.44
2019	702016	519370	182646		
2020	664263	567337	96926		
2021	739063	766021	-26958		

Source: authors’ calculation

Conclusion: The IUU yellow card does not seem to cause an obvious loss to Vietnam’s aquaculture exports to the EU, and as a matter of fact, it may even have an indirect positive impact. This positive impact lasted over three years (2018-2020) and only began to reverse in 2021. The total damage caused by the IUU yellow card to aquaculture exports is only about 27 million USD and this value only accounts for about 4% of the total export value of the group of farmed seafood to the EU 27 Vietnam achieved this year.

5. Policy implications

This study aims at quantifying the impact of the IUU yellow card on Vietnam’s seafood export revenue from 2017 to the present. Using the SCM framework for 20 fishery exporters over the 2005-2021 period, our findings could be summarized as follows: The IUU yellow card really has a negative impact on Vietnam’s captured fishery exports. From 2018 to the present, the cumulative loss in Vietnam’s captured fishery exports revenue brought about by the IUU yellow card amounted to around 220 million USD. Nonetheless, over the same period, aquaculture export has enjoyed indirect benefits from the IUU yellow card. The total

gain from higher aquaculture export value is up to 551.5 million USD over the last 5 years. The gain from the indirect impact however tends to decrease year by year and turns to negative in 2021.

Our results have particular implications, starting from the question: “*From an economic perspective, should Vietnam continue to take drastic measures to accomplish the goal of removing the IUU yellow card or not - when the costs of this campaign over the past five years have been enormous*”. Based on the results collected from the research, and the current world economic situation, the group makes some comments to help regulators find the right direction suitable for the development of Vietnam’s seafood industry.

The cost of economic loss caused by the IUU yellow card including economic loss and card removal resources is too much.

After Vietnam was hit with an IUU yellow card by the EU in 2017, Vietnam launched a series of policies with the determination of government at all levels to step in. The Fisheries Law was issued in November 2017 - right after the IUU yellow card penalty for Vietnam was announced by the EC. Based on this law, Vietnam has taken certain actions such as: Stepping up the monitoring and management of fishing vessels; Building a database, and registering and issuing fishing licenses for fishing vessels. The installation of cruise monitoring equipment on fishing vessels is strictly monitored... It can be seen that the cost of removing the card in recent years plus the economic damage caused by the yellow card is too great while IUU yellow card has not been removed yet.

The EU economy is on the verge of a recession leading to a decrease in the demand for seafood.

The war between Russia and Ukraine broke out, causing inflation in the European Union to rise sharply. High and inflation for a long time forced the European Central Bank to tighten monetary policy and sharply increase operating interest rates. From 7/2022 until now, the ECB has raised the operating interest rate 7 times in a row. Interest rates and inflation are expected to remain high, making the outlook for economies in Europe bleaker than ever, and fears of a prolonged recession are growing. The EU’s largest economy, Germany, GDP recorded a decline of 0.5% in Q4/2022 and continued to decline by 0.3% in Q1/2023. It leads to a decrease in European purchasing power and may lead to Europe restricting seafood imports further. Vietnam maybe consider other alternative markets such as Japan, China, and the US.

If Vietnam does not improve its fishing activities according to IUU requirements, the worst case scenario is that Vietnam may be warned of a red card, which means that it is not allowed to export our caught seafood to the EU.

The IUU red card will cause negative impacts on Vietnam’s seafood industry. All of Vietnam’s fishery catches with a scale of hundreds of millions of USD per year will not be allowed to be exported to the EU market and the incentives from the EVFTA will not be able to be promoted effectively. This not only causes great economic damage, but also causes painful problems for social security, when millions of fishermen will be unemployed.

The IUU red card will also have a serious impact on the reputation and image of Vietnam’s seafood in the international arena, in the context that the issue of “environmental protection” is being raised by countries around the world. Especially highlighted in recent times. In the future, other countries around the world will probably introduce similar IUU regulations for seafood exported to these countries.

The application of a red card will entail a series of consequences in the future, not only in the EU market, Vietnamese brand also has a bad reputation globally, making the seafood industry worse.

THE EFFECT OF MACRO FACTORS ON ENERGY EFFICIENCY INPUTS: A STUDY OF CPTPP COUNTRIES

Nguyen Thi Thanh Binh¹, Le Thu Hien¹, Vu Hien Lan¹, Phung Thi Due Nhi¹, Ta Thi Thanh Xuan¹
Mentor: Tran Ngoc Mai¹

ABSTRACT: *The article focuses on studying the impact of macro factors - Industrial structure, Urbanization level, Energy consumption structure, Merchandise trade, Per capita GDP, and Tourism income on the main inputs of energy efficiency including Labour, Capital stock, and Energy consumption in ten countries that signed the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) over 16 years (2000-2015), using Stochastic frontier analysis (SFA). The study results are expected to be helpful to governments in assessing the impact of energy use on CPTPP countries, thereby supporting the development of appropriate strategies and regulations to improve energy use and towards harmonized cooperation and sustainable economic development.*

Keywords: *CPTPP, SFA, energy, efficiency, factors, Vietnam.*

1. INTRODUCTION

Energy efficiency is a topic that is receiving more and more attention, especially in the context of rapidly growing populations and industries requiring more energy. The impact of energy consumption on global climate change is becoming increasingly evident. The group of studies on energy efficiency can be divided according to geographic perspective, such as the case study of a particular country China (Lei et al., 2022), Japan (Honma & Hu, 2014) or of a particular region (Assi et al., 2021), (Sun et al., 2019), (Zhang & Chen, 2022). In addition, some researchers approach the topic of energy efficiency from the industry perspective, such as the construction industry (Ouyang et al., 2021), the aviation industry (Cui & Arjomandi, 2021), the textile industry garment industry (Zhao & Lin, 2019), transportation industry (Feng & Wang, 2018). Typical studies indicate factors affecting energy efficiency, including environmental technology (Paramati et al., 2022), exports (He & Huang, 2021), FDI (Pan et al., 2020), human capital and innovation (Borozan, 2018), and GDP (Hu et al., 2019). The current state of research into energy efficiency and the factors impacting it is rather limited (Dunlop, 2019). Studies have focused on individual countries or groups lacking a more diverse and widespread regional and international pool of participants. There is no general consensus on the factors affecting energy consumption efficiency, as research papers contain disjointed and differing views.

Many different methods have been applied to determine energy efficiency, of which the two most popular methods include Data Envelopment Analysis (DEA) and Stochastic Frontier Analysis (SFA). DEA is a non-parametric method with a flexible approach, so it is widely used to build performance indicators in different fields of energy and environment to determine production possibility frontier and assess environmental and energy performance at the sectoral or economic level (Chen & Jia, 2017; Honma & Hu, 2009; Jebali et al., 2017). Stochastic frontier analysis (SFA) is a representative of parametric methods, which is one of the basic methods for handling multi-input single-output models and is considered superior and more accurate than DEA, especially in the case of relatively high measurement error (Oh & Shin, 2015). On the other hand, SFA is a parametric approach that describes sources of statistical noise from measurement errors and other random factors at the industry level and economy levels (Boyd, 2008).

¹ Banking Academy, Vietnam.

Many studies have used SFA to analyze energy data from different countries and regions, proving that SFA is an effective tool for calculating and analyzing energy efficiency. Sun et al. (2019); Zhang & Chen (2022) applied SFA to analyze 25 years of energy data from 71 economies, and their results show that green innovation and institutional quality significantly positively affect energy efficiency in these countries. Similarly, Honma & Hu (2014) applied SFA to investigate the energy efficiency and influencing factors of 41 administrative regions in Japan from 1996-2008 and found that most regions have very low energy efficiency. Hu et al. (2019) utilized SFA to analyze the provincial energy efficiency and urban energy in China from 2002 to 2015, showing that GDP has a positive short-term impact on total SO₂ emissions, but achieving a higher level of energy efficiency has an overall negative impact on emissions in the long run.

The Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) is a trade agreement among eleven countries predominantly located in the Asia-Pacific region. The member countries, which include Australia, Brunei, Canada, Chile, Japan, Malaysia, Mexico, New Zealand, Peru, Singapore, and Vietnam, are collectively interested in improving energy efficiency to boost their economic growth, reduce greenhouse gas emissions, and increase environmental sustainability. Collectively, the CPTPP countries represent a significant portion of the world economy, contributing approximately 13.4% of global GDP. Hence, insights gained from the study of these countries could have substantial relevance for global energy efficiency trends.

The dynamic relationship between energy efficiency and the socio-economic parameters that govern it is an area of profound importance and increasing attention. Energy efficiency studies to date have often been geographically or industry-specific, leaving room for an in-depth, cross-regional analysis. This study is an exploration into the interaction of *Industrial structure*, *Urbanization level*, *Energy consumption structure*, *Merchandise trade*, *Per capita GDP*, and *Tourism income*, with primary inputs of energy efficiency - *Labour*, *Capital stock*, and *Energy consumption*. Our analysis focuses on ten countries that have signed the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) over a span of 16 years, from 2000 to 2015. We have employed Stochastic Frontier Analysis (SFA), a method proven superior in situations with relatively high measurement errors, to aid our investigation. Through our research, we hope to contribute significantly to the ongoing discourse on energy efficiency, supporting the evolution of energy use strategies and regulations in CPTPP countries. The goal is to harmonize cooperation and facilitate sustainable economic development amidst an era marked by the urgent need for efficient and responsible energy consumption.

2. THEORETICAL FRAMEWORK

An overview of the research situation on factors affecting energy efficiency has pointed to diverse factors such as technical progress (Li & Lin, 2018; Wang & Wang, 2020; Zhu et al., 2019), industry structure (Xiong et al., 2019; B. Zhu et al., 2019), energy prices (Antonietti & Fontini, 2019; Barkhordar et al., 2018), economic level (Sener & Karakas, 2019), market openness (Imbruno & Ketterer, 2018; Montalbano & Nenci, 2019; Pan et al., 2020), degree of urbanization (That et al., 2018; J. Wang et al., 2019), human resources (Borozan, 2018), policy mechanisms (Du et al., 2018)... However, the results of the impact of the factors on the energy efficiency use in different countries and groups of countries are different. Moreover, the research topic is still discovering the influencing factors, so subsequent studies always need to add new factors to discover the new effects of synthetic significance. Within the scope of this study, the authors choose to study the impact of factors in the external business environment, including *Industrial structure*, *Urbanization level*, *Energy consumption structure*, *Merchandise trade*, *Per capita GDP*, and *Tourism income*.

(i) *Industrial structure*

According to Atikian (2013), the economic structure is divided into three main sectors: agriculture, industry and services. Production has been established, increasing input resources such as capital, labour and energy consumption. The industrial restructuring will affect the proportions of three major industries,

having a greater impact on energy consumption (Zhang & Chen, 2022). The industry accounts for a large proportion of the three, industrial restructuring can promote production growth, but at the same time, it can put pressure on existing resources by disrupting production patterns. According to the analysis results of Yu (2020), the most effective way to improve overall energy efficiency is to promote industrial restructuring and technological innovation. Therefore, the research hypothesis put forward is as follows:

H1: Industrial structure has a negative impact on energy efficiency.

(ii) Urbanization level

Urbanization is the migration process from rural to urban areas, resulting in higher population densities and more complex infrastructure. This leads to an increase in energy consumption as more and more people need electricity and other forms of energy. Shang et al. (2020) shows that urbanization significantly increases actual energy consumption but reduces energy efficiency. In addition, the link between energy inefficiency and urbanization increases as a country's per capita GDP increases (Li et al., 2018). This implies that rapid urbanization has trade-offs, with increased energy consumption and reduced efficiency. Therefore, the research hypothesis put forward is as follows:

H2: Urbanization level has a negative impact on energy efficiency.

(iii) Energy consumption structure

Energy consumption structure refers to the percentage of fossil energy used in an energy system or process. In general, higher rates of fossil energy consumption will lead to lower levels of energy efficiency and increased environmental impacts such as carbon dioxide emissions. Therefore, reducing fossil fuel consumption by deploying renewable energy sources or efficient technologies can help increase energy efficiency and reduce environmental impact. Wang et al., (2019), Yu et al. (2019), Zhao et al., (2019) have shown the negative impact of energy consumption structure on energy efficiency. Therefore, the research hypothesis put forward is as follows:

H3: Energy consumption structure has a negative impact on energy efficiency.

(iv) Merchandise trade

Commodity trade is the exchange of goods and products between countries and is one of the important factors of global economic activity. Trade in goods significantly affects energy efficiency, as it determines the amount of energy used in the production, transportation and exchange of goods. With the current trend of international free trade, free trade in goods is booming to satisfy consumers' global needs. The higher demand for goods, especially when goods move to geographical areas far from the place of production, will make the production and distribution of products consume more energy. Therefore, the research hypothesis put forward is as follows:

H4: Merchandise trade has a negative impact on energy efficiency.

(v) Per capita GDP

Per capita GDP ratio and energy efficiency are positively related. When per capita GDP increases, it means the country's development and people's living standards are improved. This leads to a higher rate of savings (investment) than consumption growth, creating an accumulation of surplus funds in economies that can be invested in energy-efficient projects. In addition, developed countries with high GDP value have full capabilities and resources to develop high-tech, more energy-efficient industries. Research by Sineviciene et al, (2017) argues that per capita GDP is one of the most important factors in increasing energy efficiency for post-communist countries. A 1% increase in per capita GDP will increase energy efficiency by 0.53%, which means that the wealthier a society, the higher the level of efficiency that can be achieved. Research by Zhang & Chen (2022) shows that per capita GDP and energy efficiency are positively correlated. Therefore, the research hypothesis put forward is as follows:

H5: Per capita GDP has a positive effect on energy efficiency.

(vi) Tourism income

Recent studies have shown a negative correlation between the number of tourists and the efficiency of energy consumption because the tourism industry is highly dependent on transportation - the cause of the consumption of inorganic energy. Environmental damage due to increased tourism has also been reported in the literature of Nepal et al. (2019), Scott et al. (2010) and Tovar & Lockwood (2008) because tourism is associated with travel and fossil fuel use in motor vehicles, thereby increasing greenhouse gas emissions and reducing the efficiency of energy consumption. In the study of Khan et al. (2019), a 1% increase in tourism would result in a GHG increase of 0.055% in Asia but a 0.084 % decrease in GHG in Europe due to the adoption of low-carbon economic policies and eco-friendly tourism policies environment such as using bicycles instead of fossil fuel vehicles such as cars, motorbikes... Gössling & Peeters (2007) argues that tourism increases air pollution from transcontinental transport and aviation. Therefore, the research hypothesis put forward is as follows:

H6: Tourism income has a negative effect on energy efficiency.

1. Research method

Stochastic frontier analysis (SFA) is based on a parametric approach and uses econometric models to estimate technical efficiency, technological-technical progress, and environmental efficiency. SFA assumes a functional relationship between outputs and inputs and uses statistical techniques to estimate parameters for the production function Coelli & Battese (1995). The stochastic production limit function that represents the correlation between inputs and outputs has the following general equation:

$$Y_i = f(X_i, Z_i, b, a, d) \exp(v_i - u_i)$$

In which: β, α, δ are the parameters to be estimated of the model; v_i and u_i are independent random errors; Y are common inputs factors such as labor, capital, energy; Z are macro factors.

The Cobb-Douglas function will be used to measure the impact of macro-environmental variables on the input variables of energy efficiency (Reinhard et al., 2000). We have the following equations:

$$\text{LnLabour} = \text{LnIndustrial} + \text{LnUrbanization} + \text{LnEStructure} + \text{LnMerchandise} + \text{LnGDP} + \text{LnTourism} \tag{1}$$

$$\text{LnCapital} = \text{LnIndustrial} + \text{LnUrbanization} + \text{LnEStructure} + \text{LnMerchandise} + \text{LnGDP} + \text{LnTourism} \tag{2}$$

$$\text{Ln Energy} = \text{LnIndustrial} + \text{LnUrbanization} + \text{LnEStructure} + \text{LnMerchandise} + \text{LnGDP} + \text{LnTourism} \tag{3}$$

Where: LnLabour, LnCapital and LnEnergy are the natural logarithms of the common input factors; LnIndustrial, LnUrbanization, LnEStructure, LnMerchandise, LnGDP, LnTourism are the natural logarithm of macro factors, respectively Industrial structure, Urbanization level, Energy consumption structure, Merchandise trade, Per capita GDP, Tourism income.

3. RESULTS AND DISCUSSION

Table 1. Descriptive statistics

Element	Number of observations	Medium	Standard deviation	Smallest value	The greatest value
LnLabour	160	16.72	0.97	14.59	18.02
LnCapital	160	6.55	1.19	4.79	8.99
LnEnergy	160	1.15	1.11	-0.63	3.11
LnIndustrial	160	3.41	0.19	3.01	3.88

LnUrbanization	160	4.3	0.33	3.19	4.6
LnEStructure	160	4.38	0.17	3.83	4.59
LnMerchandise	160	4.16	0.74	2.84	5.84
LnPercapita	160	9.47	1.25	5.97	11.13
LnTourism	160	2.19	1.29	0.05	6.80

Source: Author's calculation

The value of the variables has a large difference, which proves that the input and output factors in the energy consumption efficiency of the CPTPP countries are unevenly distributed. The difference in mean values between variables is mainly due to differences due to country-specific factors. Of the 10 CPTPP countries, there are 5 countries with developed economies, including Australia, Canada, Japan, New Zealand, and Singapore and 5 countries with developing economies, including Chile, Malaysia, Mexico, Peru, and Vietnam.

The results of the Likelihood Ratio (LR) test are all smaller than the chi-square value of 12,483, which means that hypothesis H0 is accepted, showing that the SFA model with the Cobb-Douglas function is more suitable for estimation (Kodde & Palm, 1986), so it can be concluded that the independent variables affect energy consumption. Specifically, all the external environmental variables pass the 1%, 5%, and 10% significance levels when testing the SFA model, proving that the selected environmental variables significantly influence the dependent variable. Depending on the input, if the regression coefficient is positive, it means that an increase in external environmental variables brings more input redundancy, leading to a decrease in energy efficiency. If the coefficient is negative, it indicates that an increase in external environmental variables promotes a reduction in input redundancy, which is beneficial for energy efficiency.

Sigma2 (σ^2) shows the total variance of the model. Gamma (γ) shows the percentage of variance due to the constant effect over time (intra-group variance). This value shows that the Gamma Factor (γ) in all 3 models is close to 1, indicating that 99% of the variance of the 1,2,3 model can be explained by time-constant efficiency or most of The variation in efficiency is due to uncontrollable factors and the model exists for technical inefficiencies (Battese & Corra, 1977), energy efficiency is affected by factors such as: on socio-economic.

(i) Industrial structure: Industrial structure has a negative correlation coefficient with all 3 input variables: Labor, Capital stock and Energy consumption. This shows that, as industrialization increases, countries often shift from labor-based industries to more capital-intensive and high-tech industries. New

technology can reduce capital and labour requirements in production, helping to increase labor productivity and capital efficiency. In fact, from 2000-2015, many CPTPP countries shifted from industrial production based on capital and labour to service and high-tech industries. This can also lead to a negative correlation between industrialization and capital and labour. Besides, industrialization and energy also have a negative correlation, showing that many countries in the CPTPP have taken measures to reduce energy consumption in industrial production to reduce CO₂ emissions and negative environmental impact. Energy-saving technologies can help reduce energy consumption while maintaining or even increasing production.

(ii) Urbanization level: The strong urbanization process is negatively correlated with *Capital stock*, *Labour* and positively correlated with *Energy consumption*. This result can be explained as follows: First, when a country undergoes urbanization, there is a tendency to move labour and capital from rural to urban areas. As a result, the agricultural industry - a major consumer of capital and labor - often declines. At the same time, service and high-tech industries often develop, but these industries often use less capital and labour than agriculture. Second, when urbanizing, the energy demand often increases to support the activities of industries and services and meet the living needs of the urban population. Transportation, construction, and urban utilities often consume large amounts of energy. Besides, providing stable and continuous energy for urban activities also requires primary energy. This can lead to a positive correlation between urbanization and primary energy consumption.

(iii) Energy consumption structure: has a positive correlation coefficient for *Capital stock* and *Energy consumption* and a negative correlation for *Labour*. When the energy consumption structure changes, this is often related to a change in the economic structure, where high-tech industries and higher energy consumption become more common. This requires a large amount of capital to invest in infrastructure and technology, leading to a positive correlation with capital capacity. At the same time, primary energy consumption also increases to meet the production needs of these industries. In addition, when fossil energy consumption increases, it may be because fossil fuels are used to operate industrial machinery, reducing the need for labor due to automation and improvement in the industry.

(iv) Merchandise trade: positively correlated with *Capital stock*, *Labour* and negatively correlated with *Energy consumption*. Increasing trade in goods often requires large amounts of capital and labour. Capital is used to build infrastructure, purchase equipment, and invest in technology to increase production capacity. Labour is used in the production, transportation, and distribution of goods. Thus, as trade in goods increases, capital and labour capacities generally increase, leading to a positive correlation. In addition, in the period 2000-2015, many CPTPP countries have taken measures to improve energy efficiency and reduce the amount of primary energy consumed in producing and transporting goods. This may explain the negative correlation between commodity trade and primary energy consumption.

(v) Per capita GDP: positively correlated with all three input variables. This result is explained as follows: Per GDP capita usually increases when a country has economic growth, and this is often accompanied by increased use of *Capital stock and Labour*. Capital is invested in economic sectors to create products and services, while labor is used to produce. Thus, capital and labor capacities generally increase when per capita GDP increases, leading to a positive correlation. Besides, when a country develops and per capita GDP increases, the energy demand usually increases to support economic activity and supply energy to the population. This can lead to a positive correlation between per capita GDP and *Energy consumption*.

(vi) Tourism income: positively correlated with *Capital stock* and negatively correlated with *Labour* and *Energy consumption*. As tourism income increases, so does the demand for tourism-related services such as hotels, restaurants, and recreational activities. This requires large capital to invest in infrastructure and services, leading to a positive correlation between tourist numbers and capital capacity. Besides, the growth of the tourism industry can reduce labor in other sectors, such as industry and agriculture, causing a negative correlation with labor. At the same time, the tourism industry may not consume as much primary energy as other sectors, primarily as CPTPP countries work to reduce the environmental impact of the tourism industry, which could lead to a negative correlation between the number of tourists and primary energy consumption.

4. CONCLUSION

As a new generation free trade agreement, the CPTPP has commitments to protect the environment so that the process of opening up, liberalizing trade and attracting investment is done in a more environmentally friendly direction; helping sustainable economic development is also a goal that member countries always aim for. Consumption of energy economically and efficiently is an issue placed at the heart of the decisions of countries in general and countries that are members of the CPTPP agreement in particular. This study aims to analyze the impact of some external macro-environmental factors such as *Industrial structure, Urbanization level, Energy consumption structure, Merchandise trade, Per capita GDP and Tourism income* up to 3 inputs of energy efficiency of CPTPP member countries, including *Capital, Labour and Energy*. The study uses data from the World Bank (World Bank), the central French research institute for international economics (CEPII) from 2000-2015.

Based on the research results, the authors propose the following policy recommendations to improve the energy consumption efficiency of CPTPP countries. *First*, to countries in industrialization, consideration should be given to shifting from labour-based industries to more capital-intensive and high-tech industries. Applying new technology will help reduce capital and labour requirements in production and increase labour productivity and capital efficiency. Moreover, focusing on energy-saving measures in industrial production will help reduce CO₂ emissions and negatively affect the environment. *Second*, urbanization should go hand in hand with increased investment in services and high-tech industries, which help create jobs and reduce dependence on agriculture. However, the process must also consider enhanced energy management, including improving energy efficiency and reducing primary energy consumption. *Third*, renewal of the energy consumption structure should be recommended to switch from fossil energy consumption to renewable energy. This also requires increased investment in energy-related technology and infrastructure. *Fourth*, increased trade in goods should go hand in hand with improved energy efficiency in the production and transportation of goods. This can help reduce primary energy consumption and emissions. *Fifth*, efforts to increase economic growth and per capita GDP also need to consider reducing environmental impact and dependence on primary energy.

We suggest future studies may be conducted in the following areas. *Firstly*, when choosing unwanted outputs, this article only considers CO₂ emissions, future studies can take into account SO₂, NO_x and other unwanted outputs. *Secondly*, it is necessary to expand on the important factors that affect energy efficiency. *Thirdly*, more new methods can be applied to measure energy efficiency, such as the DEA related models.

THE SPILLOVERS EFFECT OF US, EU AND CHINA MONETARY POLICY ON VIETNAM'S FOREX MARKET

Author: Hoang Minh Ngoc¹, Luu Minh Hang¹, Tran Ngoc Bach¹

Mentor: Pham Thi Hoang Anh¹

ABSTRACT: *This paper assesses the global spillovers from identified the world monetary policy shocks in a global VAR model. US, ECB and China monetary policy generates sizable output spillovers to the rest of Vietnam. The magnitude of spillovers depends on the interest rate of the world, Vietnam's trade balance, exchange rate regime and consumer price. Furthermore, using event-study techniques we investigate the presence and the magnitude of spillovers from the US's standard monetary policies on the forex market in Vietnam. The results of this paper suggest that policymakers could mitigate their economies' vulnerability to the world monetary policy by providing timely policy responses, increasing the flexibility of exchange rates, and reducing illegal activity.*

Keyword: *VAR, monetary policy, spillovers effect, event-study, exchange rate.*

1. INTRODUCTION

Monetary policy (MP) is a macroeconomic management tool controlled by the central bank in the form of monetary adjustment measures and appropriate interest rates. Therefore, in any context, MP aims to achieve the common goals of macroeconomic stability and economic growth. During the implementation process, the US Federal Reserve (FED) has established six basic objectives of MP: economic growth, price stability, high job creation, interest rate stability, foreign exchange market stability, and financial market stability. These goals encompass the fundamental principles of money, which impact macroeconomic stability and economic development.

Despite the fluctuations experienced in the financial-monetary markets and changes in the economic situation, including the significant change of the collapse of the Bretton Woods system, the ultimate goal of MP has remained fundamentally unchanged. The effectiveness of the central bank's MP management is reflected in the level of achievement of stable goals and economic growth, such as curbing inflation, maintaining interest rate stability, and fostering economic growth.

Numerous studies have highlighted the influence of various factors on the effectiveness of MP, such as money supply and demand, average profit margins, budget overspending, exchange rates, government interest rates, unemployment rate, price levels, and economic growth rate (GDP). Recognizing that Vietnam is a small and open economy, it is inevitable for the country to be affected by shocks in world MP. Particularly in the context of a potential economic downturn, high inflation risks, and adverse impacts from the complicated developments of the global economy on the domestic market, the government and the State Bank must choose a suitable MP that considers both domestic and foreign economies to mitigate the negative impacts from external objective factors.

Therefore, it is necessary to clarify certain issues: the spillover effect of world MP on the Vietnamese market, identify the channels through which this effect occurs, and analyze the current situation of spillover effects from the MP of major economies to Vietnam. This analysis will enable appropriate responses to the complex economic and political developments of today. Hence, we have chosen the topic "The spillover effect of world monetary policy on Vietnam's foreign exchange market" to address research gaps.

¹ Banking Academy.

2. LITERATURE REVIEW

Akinci and Queralto (2018) studied the spillover effects from US monetary policy shocks and found that using monetary policy to stabilize exchange rates is ineffective because monetary policy can exacerbate exchange rate fluctuations in the short term. Similarly, this result from their theoretical model is consistent with the empirical evidence documented by Hnatkovska et al. (2016), who find that emerging market economy currencies tend to depreciate against the US dollar when domestic rates increase relative to the U.S rates, in contrast to advanced-economy currencies.

The news of the United States conducting foreign exchange interventions has triggered capital outflows from ASEAN, posing challenges for small businesses in particular and the financial sector in general. It has also led to currency depreciation (Thorbecke, 2016). While all ASEAN-4 currencies have depreciated against the US Dollar, in actual effective terms, the Indonesian Rupiah and Malaysian Ringgit have experienced a 20% depreciation between mid-2013 and 2015, whereas the Philippine Peso and Thai Baht did not depreciate. Chen et al. (2014) examined how Fed policy news affected emerging market asset prices both during the tapering period and before. They decomposed Fed policy news into “signal shocks” that affect expectations of future short-term policy rates and “market shocks” that affect longer-term rates through other channels. Estimating a panel regression model for 21 emerging market economies, they reported that news of contractionary policy measured either way during the tapering period lowered stock returns, raised bond yields, and depreciated exchange rates in emerging markets.

Georgiadis (2016) estimates spillover effects from US monetary policy to a large set of countries using a GVAR approach. He finds that spillover effects on output are stronger in countries which are less financially developed, less open to trade and which have less flexible exchange rates and labor markets. Another set of papers examines the transmission of common Euro area monetary policy shocks across member states of the monetary union (Barigozzi et al., 2014). A common finding of these studies is that Euro area monetary policy transmits rather homogeneously to output in different member states, but that there remain asymmetries in the responses of prices and unemployment. In contrast, monetary policy spillovers to European countries outside of the Euro area have also received attention in the literature. Mumtaz and Surico (2009) use a FAVAR approach to estimate the effects of an international monetary policy shock on the UK and find that, after a foreign monetary expansion, UK output increases despite an appreciation of the exchange rate.

Bowman et al. (2014) analyzed the impact of US unconventional monetary policy on stock prices, government bond yields, and exchange rates in emerging market economies. They found that the announcement of unusual Federal Reserve (Fed) monetary policy had a significant impact, particularly on domestic currency bond yields, although the magnitude and duration of the effects varied across countries. They also observed that the economic weakness of a country fundamentally increased its vulnerability to changes in the Fed’s normalization process. Tillmann (2014) finds that Fed’s QE policies had strong effects on financial conditions in emerging markets and played an important role in explaining capital inflows, equity price and exchange rate movements in these economies.

According to Gopinath (2016) and Ozcan (2020), the view suggests that monetary policy easing could weaken a country’s currency enough to bring about long-term improvements in its trade balance. Moreover, in line with theoretical predictions, during periods of non-traditional monetary policy, a currency shock related to increasing stock prices, decreasing interest rates, and a strengthening domestic currency was observed in developing Asian markets (Tran et al., 2020). These findings confirm the existence of spillover effects from the US to partner countries through transmission channels, including exchange rate channel, portfolio rebalancing channel, and liquidity channel.

Aizenman et al. (2014) evaluate the impact of the Fed’s tapering announcements from 2013 on financial markets in emerging economies and conclude that countries with stronger fundamentals face a

larger depreciation of exchange rate, fall in stock prices and increase of CDS spreads than countries with weaker fundamentals. Eichengreen and Gupta (2014) show that countries with larger and deeper financial markets experienced more pressure on exchange rates, foreign reserves and equity prices following the Fed's tapering announcement from May 2013 as investors could better rebalancing their portfolios in a country with relatively large and liquid financial markets.

Based on previous research related to exchange rate reactions, the findings of Geun-Young Kim; Park and Tillmann (2019) indicate that for Brazil, Chile, the Czech Republic, Hungary, Indonesia, Malaysia, and Mexico, the loosening of US monetary policy has a greater impact than tightening. However, for South Korea and Poland, the authors found the opposite result, as tightening US monetary policy leads to a larger depreciation of the domestic currency. Furthermore, Lee et al. (2017) provided further insights by highlighting that interest rate changes in the US have a consistent effect on Asian countries with fixed exchange rate regimes. Conversely, interest rate fluctuations in the US have an insignificant impact on Asian countries with floating exchange rate regimes.

In addition, Pham and Nguyen (2019) evaluate the spillover effect of UMP from the US on the monetary policies in Asian countries by a Bayesian vector autoregressive model. To address such an issue, this research considers how policy rates in Asian countries respond to the shock to the Fed policy rate. The empirical results indicate a co-movement between policy rates in Asian economies and the US with a lag of one quarter. Concerning the size of responses, Asian developing countries characterized by pegged rate regimes significantly respond to innovations in the Fed rate, while the developed ones are less likely to be affected by the UMP shocks. Therefore, in the context of conventional foreign exchange interventions, the ECB appears to be the main foreign central bank for the Central and Eastern European (CEE) economies. Building on these findings, Zhiwei et al. (2020) investigated the spillover effects of US foreign exchange interventions on the exchange rates of 11 emerging markets and 12 advanced economies during the pre-Covid-19 period using the VAR model with country-specific structural specifications.

Similarly, this paper is also related to the literature on the spillovers from US monetary policy to global financial markets (see Craine and Martin, 2008; Walerych and Wesołowski, 2021; Georgiadis, 2016; Rogers et al., 2014). These papers study the effects of US monetary policy shocks on other countries' equity and bond markets, capital flows and exchange rates, typically at high frequency. This literature finds that financial spillovers are large, and it establishes that country characteristics referring to financial market structure and integration explain a substantial fraction of the cross-country heterogeneities. The papers in this literature investigate different dimensions of US monetary policy, such as conventional and unconventional policies, surprises to the federal funds rate target and to its future path as well as announcements and asset purchases. However, in contrast to this paper this literature does not examine the global output spillovers from US monetary policy and their determinants. Moreover, these papers do not account for the multilateral nature of spillovers. Specifically, Rogers et al. (2014) observe that there are important cross-country spillovers from unconventional monetary policies in the US, the UK, the euro area and Japan among these advanced economies. They find such monetary policy spillovers to be asymmetric, as the effects of the monetary policy shocks in the US economy on asset prices in the other three economies are larger than the spillovers from these countries' policies on the US.

Kucharèuková et al. (2016) assess the impact of ECB monetary policy on macroeconomic developments in the euro area as well as in six non-euro area EU countries. They construct a monetary conditions index, which they decompose into conventional and unconventional monetary policy measures. They estimate individual-country VAR models to examine if the effects of conventional and unconventional tools differ. Their results suggest that the reaction of industrial production to the unconventional monetary policy shock is weaker and less significant than the reaction of industrial production to a conventional policy shock. In addition, their results suggest that the response of prices to unconventional monetary policy is much quicker in comparison to the response to conventional monetary policy. Additionally, their results find only

limited evidence for international spillovers from unconventional ECB monetary policy. Output responds to the unconventional monetary policy shock only in selected non-euro area EU countries. In addition, the response of price is insignificant in non-euro area EU countries. They also find that exchange rates react quickly with a peak within a few months and that the exchange rates depreciate after monetary tightening in a majority of countries. Hajek and Horvath (2015) apply GVAR models to analyze the transmission of Euro area interest rate shocks to a large set of non-Euro area countries and find symmetric responses of output in most non-Euro area countries, with small economies reacting even stronger than the Euro area.

Falagiarda et al. (2015) study the effects of the ECB's non-standard policy measures on financial variables from non-euro area EU countries in Central and Eastern Europe (CEE). Using an event-study analysis they find that ECB UMP measures spilled over to CEE countries. In particular, sovereign bond yields were affected by ECB announcements of UMP measures. They find no impact on exchange rates vis-à-vis the euro, equity prices and CDS spreads. Furthermore, their results suggest that spillovers from SMP announcements were the most pronounced. The spillover effects of both OMT and PSPP on financial assets from CEE countries was limited. Furthermore, Korus (2019) examined the spillover effect of unique unconventional foreign exchange interventions (UFEI) by the ECB on advanced open and small economies. The author found that the CDS spreads in Denmark and interbank exchange rates in Norway were influenced by the ECB's announcements regarding non-standard policy measures, respectively. The findings of the study also indicate that bilateral exchange rates and standard stock market indices were not affected by the ECB's announcements.

In contrast to previous studies, our research focuses on the spillover effects of major global monetary policies on the foreign exchange market in Vietnam. Specifically, we pay special attention to two important periods: the Covid-19 pandemic phase and the recent monetary tightening phase. Additionally, our study employs the Vector Autoregression (VAR) model and event study methodology to analyze and evaluate the spillover effects of global monetary policies on Vietnam's foreign exchange market.

3. RESEARCH METHOD

3.1. The Methodology

3.1.1. Selection of VAR model

The research utilizes a VAR (Vector Autoregression) model to assess the effectiveness of the spillover effects of world monetary policy on the financial market through the channels of exchange rates, asset prices, and interest rates. We choose the VAR model because it helps identify independent shocks that the VAR model itself cannot distinguish. As a multivariate linear model of observed vectors and their own lags, VAR is used by economists to recover economic shocks from observed entities by imposing minimal assumptions consistent with a large class of models (Hakan Yilmazkuday, 2020; Elbourne, 2008). This model encompasses multiple variables, with all variables in the model playing equal roles and being endogenous variables. Therefore, the Structural Vector Autoregression (VAR) model is an important quantitative tool in economics and widely applied to issues related to aggregate economic variables.

The reduced-form VAR model takes the following form:

$$y_t = A_1 Y_{t-1} + \dots + A_p Y_{t-p} + B_o x_t + \dots + B_q x_{t-q} + CD_t + u_t \quad (1)$$

Which:

$y_t = (y_{1t}, \dots, y_{kt})$ is a K vector of observed endogenous variables.

$x_t = (x_{1t}, \dots, x_{Mt})$ is an M vector of observed exogenous variables.

D_t : contains deterministic variables such as constants, linear trends, dummy seasonal variables as well as other dummy variables.

u_t : is the process of white noise K-dimensional with expectation 0.

3.1.2. Selecting an Event model

The research model is established to assess the impact of the spillover effects of world monetary policy on the Vietnamese financial market by examining the exchange rate (USD/VND), stock market index, and interest rates in Vietnam under the influence of announcement events. In reality, the exchange rate (USD/VND) and stock market index often exhibit fluctuations even in the absence of the research events. In this model, the study utilizes the estimation window before and after the event to determine the relationship between the Vietnamese financial market and world monetary policy shocks through regression analysis. Based on the regression coefficients, the spillover effects of world monetary policy can be predicted, and the research team can propose specific solutions accordingly. The model is described by the following formula:

$$\Delta y_{it} = \alpha + \Delta x_{i(t-k)} - \Delta x'_{i(t+k)} + u_t \quad (2)$$

Which:

Δx_{it} : dependent variable of day i in t-k period

$\Delta x'_{it}$: dependent variable of day i in t+k period

t: time from window length $\forall t \in [-T; +T]$

k: window length include [10; 15; 20]

After calculation, the value of Y_{it} for each dependent variable i at each time t within the event window reflects the positive impact ($y_{it} > 0$) or negative impact ($y_{it} < 0$) of the event on the financial market in Vietnam.

3.2. Data

3.2.1. Dependent variables

The research group selected two variables as representatives of the foreign exchange market to test their consistency. The selection of representative exchange rate variables is an important part of the research process, aiming to analyze and evaluate the spillover effects of global macroeconomic and financial factors on the foreign exchange market in Vietnam.

Official USD/VND exchange rate: used as a representative variable in the regression model, with data collected from the State Bank of Vietnam (SBV).

Parallel USD/VND exchange rate (HNX): used as a representative variable in the regression model, with exchange rate data collected from the database of the Hanoi Stock Exchange.

3.2.2. Independent variables

The US Dollar Volatility Index (USDindex): a measure of the value of the US dollar against a basket of other currencies in the international market. It is widely used by investors and financial experts. The data on the USD Index volatility is primarily collected from the US Federal Reserve.

Trade balance: represents the difference between a country's exports and imports over a specific period. It is one of the important economic indicators used to measure the health of an economy and the trade activities of a country. Monthly trade balance data is collected from the General Statistics Office.

CPI (Consumer Price Index): an economic indicator used to measure the changes in prices of goods and services consumed within a specific country. In essence, CPI can be understood as a fundamental index that reflects the relative fluctuations in consumer prices over time, and its calculation is expressed as a percentage. Typically, CPI is computed by comparing the average value of a basket of goods and services purchased by consumers during a specific period to the value of the same basket in a previous period.

Consequently, CPI data is collected by the Central Statistics Office for statistical analysis and assessment..

Vietnam Policy Interest Rate (Refinancing Rate): the interest rate applied by the State Bank of Vietnam (SBV) to the loans extended to credit institutions for refinancing their business activities. Consequently, the refinancing rate is regarded as the cost that credit institutions have to pay to the SBV for obtaining refinancing funds. The refinancing rate is a significant factor in interest rate management and the conduct of monetary policy by the SBV. It influences other interest rates in the economy, including deposit rates, lending rates, and bond yields. The refinancing rate is also an important economic indicator for evaluating the financial condition of credit institutions and the overall economy. In this study, we will use this interest rate as a representative variable in our regression model, with data collected from the State Bank of Vietnam.

The FEDERAL Funds Rate: represents the rate at which banks lend to each other on an overnight basis as regulated by the Federal Reserve (FED). When member banks fail to meet the required reserve ratio before a scheduled FED examination, they are obligated to borrow funds at this interest rate. It is considered a key tool for controlling the US economy and serves as a benchmark for credit interest rates, collateral rates, and other borrowings at member banks. Based on data collected from the US Federal Reserve, we have decided to incorporate it as a representative variable in our regression model.

ECB interest rate (MRO): the interest rate for main refinancing operations conducted by the European Central Bank (ECB) to provide a significant portion of liquidity to the banking system. It represents the interest rate at which banks borrow money from the ECB for a week. The ECB refinancing rate is a tool used by the European Central Bank to adjust based on inflation rates, unemployment rates, and overall economic development. In the research, this interest rate will be used as a representative variable in the regression model, with the primary data collected from the official sources of the European Central Bank.

China Interest Rate (LPR): a type of interest rate that commercial banks in China offer to their important customers and serves as a benchmark for other loan interest rates. The LPR is based on the loan interest rates of 18 designated commercial banks determined and reported by the People's Bank of China (PBC) on a monthly basis. In the research, this interest rate will be used as a representative variable in the regression model, with data collected from the official website of the People's Bank of China.

These variables of the model have been collected on a monthly basis over the period from January 2015 to December 2022. They include indicators reflecting the dynamics of the Vietnamese economy and major economies around the world throughout the months. This enables a clear understanding of the impact of changes in the global economy on Vietnam.

Table 3.1: Definition of Variables and Data Sources

Variable symbol	Explanation	Measured	Source	Expectancy mark
Dependent variable				
DELTAER1	Official USD/VND exchange rate	The fluctuation of the official USD/VND exchange rate	SBV(2023)	(+)
DELTAER3	Parallel USD/VND exchange rate	The fluctuation of the parallel USD/VND exchange rate	HNN(2023)	(+)
Independent variable				
IRFED	The shock of US Monetary policy	US Executive Rate by Month	FED (2023)	
IRECB	The shock of Europe Monetary policy	Europe's operating interest rate in monthly terms	ECB (2023)	
IRCNY	The shock of China Monetary policy	China's operating interest rate in monthly terms	PBC (2023)	
USDindex	USD Volatility Index	The value of the dollar against other currencies on the international market	FED (2023)	

CPI	The Vietnam Consumer Price Index.	Changes in the prices of consumer goods and services compared to the same period last year	GSO(2023)	
TB	Balance trade	The difference between export turnover and import turnover	GSO(2023)	
POLICY RATEVN	Vietnam's operating interest rate	Vietnam refinancing interest rate on a monthly basis	SBV(2023)

3.3. Descriptive Statistics

The collected data is processed and calculated in Excel. Because the study sample time is relatively long and new from 2015 to 2022, the data are inevitably flawed. The research team conducted data cleaning, data testing and remediation. Then, the team selected Eviews software to obtain the results according to the model shown in Table 3.2.

4. RESULTS AND DISCUSSION

4.1. Monetary policy spillovers to Vietnam's forex market by VAR model

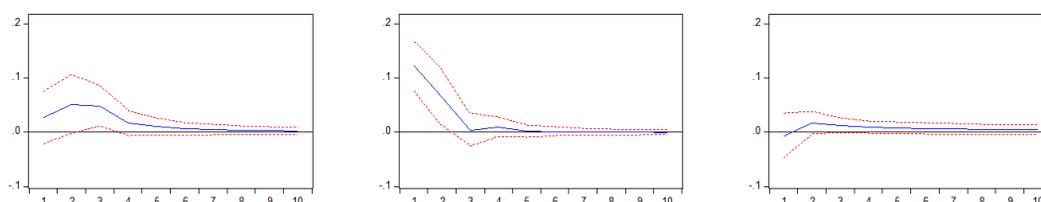

The impact of interest rate changes in major economies such as the US, Europe, and China on the exchange rate in Vietnam through the Hanoi free market is partially explained in Figure 4.1. It sheds light on the influence of the exchange rate channel.

Figure 4.1: The impact of FED, ECB, PBC monetary policy shock on USD/VND exchange rate

(a) The impact of FED, ECB, PBC monetary policy shock on official USD/VND exchange rate

(b) The impact of FED, ECB, PBC monetary policy shock on parallel USD/VND exchange rate

Source: Author's calculation

Looking at the reaction function graph, we can draw some conclusions about the global impact of the world interest rate on the central USD/VND exchange rate as follows:

Firstly, the central USD/VND exchange rate does not strongly react to changes in the world interest rate when the exchange rate fluctuation range is very narrow at around $\pm 0.1\%$ for 7 months after the US financial crisis. Specifically, when the US interest rate increases by 1%, the central exchange rate does not have a significant impact in the first month, but it increases by 0.07% in the second month and reaches a saturated state, ceasing its reaction in the fifth month after the shock. The main reasons for this phenomenon may include:

(i) Stability of the State Bank's foreign exchange market intervention: Exchange rate stability is one of the main objectives of the State Bank's management of the foreign exchange market in Vietnam. This means that the State Bank of Vietnam can use various measures to maintain the stability of the VND exchange rate, even when external factors such as the increase in the US interest rate may affect it. Therefore, as soon as the US interest rate increases, the State Bank intervenes immediately to prevent the increase of the central USD/VND exchange rate in the first month. In theory, to cope with such fluctuations, central banks will implement some measures to stabilize the foreign exchange market, such as direct intervention in the market by selling foreign exchange reserves to increase the supply of foreign currency or adjusting the central exchange rate or fluctuation range¹. However, initially, the State Bank still holds a large amount of foreign exchange reserves, so the central USD/VND exchange rate may not decrease or change significantly. But after a period of time, the State Bank cannot sell more foreign exchange reserves due to the intervention of speculators². Therefore, due to the strong pressure on the exchange rate from the impact of eight consecutive increases in the US interest rate, the State Bank was forced to increase the central exchange rate.³

(ii) The mechanism of the foreign exchange market: The central exchange rate is considered an important reference point for the foreign exchange market, causing other exchange rates to fluctuate accordingly and being regulated by the State Bank. Therefore, in the short term, when the US interest rate increases, the exchange rate in the free market will rise, but the central exchange rate will not have a significant impact and the reaction will be delayed.⁴

Conversely, when China increases its interest rate by 1%, the central USD/VND exchange rate does

¹ Indeed, in reality, the State Bank of Vietnam (SBV) has made efforts to reduce the USD/VND exchange rate using all three tools mentioned. Specifically, the SBV has continuously sold foreign exchange reserves. This action has led to a decrease in foreign exchange reserves from a record level of 111.5 billion USD to around 87.6 billion USD by the end of the third quarter of 2022. The figure continued to decline in the fourth quarter due to market tensions.

² The SBV cannot sell excessive amounts of foreign exchange reserves because speculators could take advantage of this to drive down the value of the Vietnamese currency, seeking to profit by buying Vietnamese currency and then waiting for it to appreciate. If the SBV sells too many foreign exchange reserves, the supply of foreign currency in the market will increase, leading to a sharp depreciation of the Vietnamese currency and providing an opportunity for speculators to profit.

³ On October 17, 2022, the exchange rate of USD/VND increased from 23,568 to 23,637, with an expanded fluctuation band from 3% to 5%.

⁴ In reality, the exchange rate difference between the official market and the free market reached 4.6%.

not have a significant reaction, only a small increase of 0.01%. The main reason for this impact is the economic correlation between Vietnam and China. China is not the largest export partner of Vietnam, although it is the largest import partner. This means that the economic impact of China on Vietnam may not be as significant as expected. Additionally, Vietnam has strengthened the diversification of its economic and trade relationships with other countries, reducing dependence on China.

Unlike the central exchange rate, when the Fed increases its interest rate by 1%, the USD/VND exchange rate in the free foreign exchange market in Hanoi immediately increases from 0.027% to 0.052% in the second month, and gradually decreases, ceasing its reaction in the fifth month after the shock. According to theory, when the Fed tightens monetary policy through interest rate hikes, including Vietnam's interest rate, it will be pushed up but not significantly. This development will increase the interest rate differential between domestic and foreign currencies, leading people to have a greater demand for US dollars in the free foreign exchange market, thereby pushing up the value of the USD against the VND and causing a slight increase in the USD/VND exchange rate. This phenomenon is attributed to the following reasons:

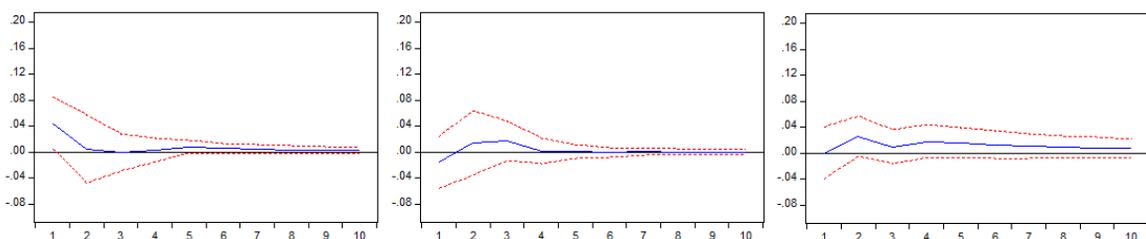

Firstly, when interest rates are higher in the US, the USD becomes more attractive to investors, especially international investors. Therefore, in the case of an interest rate increase in the US, the USD becomes more appealing to investors, leading to an increased demand for US dollars in the international market. As a result, the value of the USD will rise against the currencies of other countries, including Vietnam. Additionally, the increase in interest rates in Vietnam is not sufficient to outweigh the attractiveness of the USD in the international market, leading Vietnamese people to have a tendency to buy more US dollars for investment or currency reserves. This will increase the supply of USD in the market, and the USD/VND exchange rate in the free foreign exchange market in Hanoi will also fluctuate upward.

Secondly, the volatility of the USD/VND exchange rate in the free foreign exchange market depends heavily on exchange rate expectations. This reflects the herd mentality of the Vietnamese people. When the exchange rate increases, people tend to rush to buy foreign currency out of fear that the exchange rate will continue to rise in the future. In addition, the free foreign exchange market is more preferred than official channels or through commercial banks because it is simpler and does not require extensive legal procedures.¹ This further contributes to a stronger exchange rate increase as supply and demand in the free market are greatly influenced by customer behavior and market expectations.

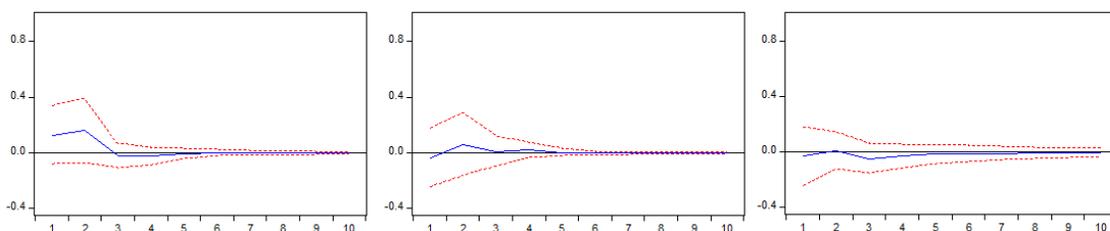

When the ECB interest rate increases by 1%, the USD/VND exchange rate in the free foreign exchange market in Hanoi increases by 0.12% in the first month and reaches a new equilibrium of 0.002% in the fifth month after the shock. This observation is consistent with the evidence of the increasing influence of the US, Europe, and China on exchange rate fluctuations in countries with open economies like Vietnam (Willem Thorbecke, 2016; Sin Yee Lee et al., 2022; Małgorzata Walerych, 2021).

Furthermore, the changes in interest rates, monetary policy, and inflation in Vietnam have also influenced the USD/VND central exchange rate and the free market exchange rate, as shown in Figure 4.2.

Figure 4.2: Reaction of the USD/VND central exchange rate and the USD/VND exchange rate in the free market in Hanoi to the volatility of interest rates, monetary policy, and inflation in Vietnam

¹ To carry out important transactions such as current account transactions, it is necessary to provide documentation and proof of purchase. These documents typically include invoices, contracts, receipts, and other relevant paperwork that demonstrate the purpose and nature of the transaction.

Source: Author's calculation

When the State Bank of Vietnam (SBV) tightens monetary policy by raising the refinancing interest rate, it causes both the USD/VND central exchange rate and the USD/VND exchange rate in the free market in Hanoi to initially increase sharply in the first month, followed by a gradual decrease and eventually reaching a stable level by the fifth month after the shock. This conclusion seems to contradict theory, as when the SBV implements contractionary monetary policy by raising the refinancing interest rate, it pushes up the overall interest rate level, including the deposit interest rate. This development widens the interest rate differential between domestic and foreign currencies, prompting investors to sell foreign currency and buy domestic currency to pursue higher returns. As a result, the domestic currency appreciates against the foreign currency, leading to a decrease in the USD/VND exchange rate. The reasons for this phenomenon are as follows:

(i) When the SBV raises the refinancing interest rate (implementing contractionary monetary policy), it increases the market interest rate level, including borrowing costs, causing the production costs of domestic firms to rise. Higher production costs contribute to an overall increase in prices, leading to inflation and a depreciation of the VND against the USD.¹ In another explanation, when overall prices rise, it reduces Vietnam's international trade competitiveness, leading to an increase in import value. The higher import value affects the demand for foreign currency, causing the USD/VND exchange rate to increase, which is equivalent to the devaluation of VND.

(ii) The decision to raise the refinancing interest rate by the SBV typically occurs when the economy is under significant inflationary pressure. In this context, Vietnamese people have a habit and psychological inclination to hoard gold and USD. Therefore, even though the increase in refinancing interest rates raises the market interest rate level, including deposit rates, the shift in asset allocation from foreign currency to domestic currency tends to be slow due to concerns about inflation. This is a common trend in countries with high inflation rates and a high degree of dollarization in their economies.

On the other hand, the impulse response function derived from the VAR model shows that the trade balance in Vietnam has a strong and inverse impact on the USD/VND exchange rate in Vietnam during the period of 2015-2022. This can be explained as follows: when there is a surplus in the trade balance in Vietnam, the supply of foreign currency in the market increases, leading to a decrease in the exchange rate. This creates downward pressure on the USD/VND exchange rate, meaning that the Vietnamese dong is valued higher against the USD. Additionally, when there is a surplus in the trade balance, it indicates the strength and competitiveness of domestic export industries, instilling confidence and attracting foreign investors. This can increase the demand for foreign currency and decrease the USD/VND exchange rate. Furthermore, the impulse response function also shows a relatively weak impact of inflation on the USD/VND exchange rate in Vietnam. Specifically, if inflation increases, it may be expected that the State Bank of Vietnam (SBV) will implement tighter contractionary policies to curb inflation. This expectation can reduce the impact of inflation on the USD/VND exchange rate before policy measures are actually implemented.

In conclusion, the stability of the contractionary monetary policy and the mechanism of the foreign exchange market may be the main factors leading to the USD/VND exchange rate not showing significant

¹ The theory of purchasing power parity states that the level of exchange rate fluctuations depends on the difference in inflation rates between the domestic and foreign countries. According to the equation $E = P + P^*$, when domestic inflation increases, the exchange rate increases, meaning that the foreign currency appreciates, while the domestic currency depreciates.

reactions to global interest rate shocks. However, these factors have contributed to reducing volatility and increasing the stability of the central USD/VND exchange rate and the exchange rate in the free market over the years. Therefore, the SBV must consider and have an appropriate strategic plan to adjust the exchange rate reasonably, but without excessive measures to avoid negative impacts on the market.

4.2. Research Results Based on Event Study Model

To further clarify the spillover effects of global monetary tightening through transmission channels, the research team employed the event study method to explain the spillover effects of monetary tightening shocks in 2022. This method was used similarly to previous studies (Lucca & Moench, 2015; Park et al., 2018). The results from the event study, where dependent variables were modeled according to equation (2), are presented in tables 4.1.

Table 4.1: The measurement results of the transmission channels around the event of US monetary policy shocks based on the Signtest method (measuring the sign) are as follows

Variables Event windows	DELTAER1			DELTAER3		
	10 days	15 days	20 days	10 days	15 days	20 days
16/3/2022	(+)	(+)	(+)	-	(+)	-
15/6/2022	(+)	(+)	-	(+)	(+)	-
27/7/2022	-	-	-	-	-	-

The central exchange rate of USD/VND and the USD/VND exchange rate in the Hanoi free market have a significant and positive impact on the shock of the Federal Reserve (FED). If the FED increases interest rates by 1%, the State Bank of Vietnam (SBV) also increases the USD/VND exchange rate announced by the SBV and in the Hanoi free market within a 15-day period following the shock. This indicates that the SBV appears to demonstrate good orientation towards the USD/VND exchange rate because in the first 10 days, there is not much impact on the foreign exchange market, but the spillover effect of the US monetary policy shock becomes more evident after 15 days. This phenomenon is due to the impact of domestic and international factors on the Vietnamese foreign exchange market.

In the first 10 days, the SBV did not take many measures to stabilize the USD/VND exchange rate but only strengthened monitoring and market information gathering. However, in the context of global impact from the Covid-19 pandemic and the difficulties and fluctuations faced by the global economy, the US implemented stimulus measures, including increasing interest rates and enhancing public spending, leading to a shift in capital flows from other countries to the US. This has affected the foreign exchange markets of many countries, including Vietnam. These fluctuations have influenced the USD/VND exchange rate, but thanks to the intervention of the SBV, including buying VND and adjusting interest rates within a 15-day period, the Vietnamese foreign exchange market has been more stable compared to many other countries. This conclusion accurately reflects the theory and is relatively consistent with the findings of previous research (Sebnem, 2020; Xu et al., 2020).

5. CONCLUSION AND RECOMMENDATION

5.1. Conclusion

The spillover effects of the monetary policies implemented by US, EU, and China on Vietnam's foreign exchange market have been significant and multifaceted. Firstly, the US monetary policy, characterized by changes

in interest rates and quantitative easing measures, has been a major driver of forex market fluctuations in Vietnam. The Federal Reserve's decisions have influenced capital flows and investor sentiment, resulting in exchange rate volatility and impacting Vietnam's export competitiveness and import costs. The US dollar's strength or weakness has had direct implications for Vietnam's exchange rate stability and trade balance. Secondly, the monetary policies of the EU, particularly ECB measures to stimulate the Eurozone economy, have also affected Vietnam's forex market. Thirdly, China's monetary policy, primarily through its management of the interest rate, has had notable spillover effects on Vietnam's forex market. As Vietnam's largest trading partner, fluctuations in the interest have impacted the competitiveness of Vietnamese exports in the Chinese market and influenced the cost of imports. Moreover, China's monetary policy actions have influenced investor sentiment and capital flows, which have ripple effects on Vietnam's forex market stability. Hence, Vietnamese policymakers need to be prepared to mitigate potential risks and take advantage of opportunities arising from such spillovers.

5.2. Recommendation

(1) *The State Bank of Vietnam (SBV) needs to closely monitor long-term fluctuations in global monetary policies, particularly those related to the US and Europe, and respond promptly to global monetary shocks.* In order to ensure stability in the foreign exchange and currency markets, the Forecasting and Statistics Department of the SBV should study and measure potential shocks that may occur, especially those related to the US and Europe.¹ At the same time, the SBV needs to forecast accurately and closely monitor global monetary shocks in order to implement timely policies to mitigate negative impacts on interest rates and the currency market. Preventive measures and risk mitigation should also be implemented to protect Vietnam's currency market.² Additionally, the SBV should develop feasible and potential scenarios for global monetary shocks to ensure flexibility and better response capabilities.

(2) *The SBV can convey messages to increase public trust in its operations.* The Communications Department of the SBV should disseminate messages about maintaining stable exchange rates, controlling inflation, and enhancing public trust in the operations of the SBV and the banking system. The SBV should take actions to regulate the economy in a positive direction to gain trust from the public. Providing information about the activities of the banking system is crucial for the public to have a clear understanding of the necessary knowledge.

(3) *The SBV needs to implement measures to cope with market volatility by increasing foreign exchange reserves.* When there are significant fluctuations in the domestic market, the SBV should be prepared with sufficient resources to meet foreign currency demand and intervene to ensure market liquidity, thereby contributing to macroeconomic stability and inflation control.

(4) *The SBV should take measures to reduce illicit activities.* The risk of speculation and hoarding increases when exchange rates rise, so the SBV needs to take action to prevent such activities. It is also important to raise awareness about the risks of speculation and hoarding and illicit foreign exchange transactions so that people can be cautious. Furthermore, the SBV should enhance management and supervision of foreign exchange trading activities in the market. This includes ensuring strict compliance with regulations and rules related to foreign exchange trading and establishing an effective monitoring system to detect and prevent illicit foreign exchange transactions.

THE IMPACT OF FINANCIAL DEVELOPMENT AND PETROLEUM PRICE ON TRADE OPENNESS: THE CASE OF ASEAN+ COUNTRIES

**Author: Phan Thi Ngoc Anh¹, Nguyen Vu Hien Thuong¹, Nguyen Hoang Minh¹
Mentor: Nguyen Thi Lam Anh¹**

Abstract: This paper investigated the impact of macroeconomic determinants, including financial development and petroleum price, on trade openness in the context of ASEAN+5 countries from 2010 to 2022. The data were analysed using the GMM method. Regarding financial development, the results affirmed the positive impact of domestic credit to the private sector and the negative impact of the consumer price index on trade openness. Additionally, the petroleum price positively affected the trade openness for the ASEAN+ countries. The paper also found significant influences on trade openness of other control variables, including economic development, human capital, and the real effective exchange rate. Furthermore, some recommendations enhancing the trade openness for ASEAN+5, specifically Vietnam, were also discussed for further international integration, boosting economic growth.

Keywords: financial development, trade openness, petroleum price, ASEAN+5

1. INTRODUCTION

Trade openness is vital in creating new market opportunities for domestic firms, more substantial productivity, and innovation through competition between countries. According to OECD (2023), increased trading activities resulted in governments opening markets. Traditionally, trade and market openness correlate with improved economic performance in nations at all stages of growth, offering intriguing opportunities for consumers, businesses, and workers worldwide and helping to reduce poverty levels. Some countries, particularly the developing, have always been concerned about the Trade Openness (Zahonogo, 2016), which significantly impacts competitiveness, technology, prices of intermediate and final goods, and over time, even factor endowments and social institutions. Therefore, predicting how trade liberalisation would affect certain groups of people is difficult.

On the other hand, open economies typically experience faster economic growth than closed economies (Grossman & Helpman, 1994; Edwards, 1989). Better local technology and the capacity to increase production efficiency lead to higher productivity. As a result, many countries usually place high importance on trade openness while attempting to boost economic growth. Trade openness, however, is only sometimes as successful as expected (Singh, 2010). In particular, if macroeconomic steadiness and a favourable investment climate are absent, it is difficult to increase the contribution of Trade Openness to enhancing Economic Growth (Newfarmer & Sztajerowska, 2012). In light of the Covid epidemic, which has seriously disrupted international trade, the year 2020 witnessed the steepest fall in global trade by 8.9% since the crisis in 2008 (Dickinson & Zemaityte, 2021). Hence, having an in-depth view of trade openness in terms of its impact on the countries' factors is essential in this era.

In terms of the petroleum price, which also has a connection to trade openness, it is argued that the volatility of the oil price (or gasoline price) can significantly impact the nation's trade openness when it is related to whether the nation imports or exports oil (Pan et al., 2022) the more increase in oil price consequence in reducing the trade openness level in terms of oil import countries.

Financial Development is a fascinating subject that many empirical studies believe to be significant. It is related to "factors of the production process" because of the beneficial effects of accumulation and

¹ Banking Academy.

capital on long-term economic development. Thus, financial development significantly enhances business activities through adequate resource allocations, reduction of transaction costs, savings mobilisation, and addressing the information asymmetry issue.

According to Khatun and Bist (2019); Kyophilavong et al. (2016), economic efficiency and growth are ultimately boosted by attaining economies of scale. The financial development analysis brings researchers a full grasp of the possibilities for financial institutions to offer financial services to other economic entities (Bui, 2020). Effective resource allocation is also made feasible by the financial advancement (Cherif & Dreger, 2016). As a result, promoting financial growth is crucial for promoting economic growth (Camba, 2020; Tran & Nguyen, 2020). According to Esso (2010), countries with higher levels of financial development also have more mature banking and stock markets, which results in better financial services and faster economic growth than countries with lower levels of financial development. In the commercial process, the stability of the domestic financial development can create an opportunity to increase trade openness without concern about the crowding-out effect caused by trade openness (Silajdzic & Mehic, 2017). Moreover, financial development also stimulates trade openness when ensuring the market supply for export and controlling the CPI to absorb the country's import value inadequately (Sonnenshein, 2022). From this standpoint, not only maintaining the trade value (importing and exporting) but also stimulating it significantly affect the trade openness level of countries.

Previous research mostly focused on the effects of financial development or petroleum price on trade openness, but some contributed to the idea of factors that affect trade openness outside the ASEAN+ area. Trade openness helps developing nations expand their internal markets and boost productivity and creativity through global competition (Deb et al., 2021). In ASEAN+, most countries buy oil, although some export it, albeit unequally. China, India, Vietnam, Brunei, and Malaysia export tiny amounts of oil, while the others import it. According to Berument et al. (2010), rising oil prices are favorable for exporters but bad for importers. Oil prices affect economic activity through demand and supply channels (Rotemberg & Woodford, 1996). ASEAN+ countries used bank-based financial systems, save China and Vietnam (Ha, 2019). Hence, the bank is crucial to ASEAN+ financial development, particularly domestic financing to private sectors. According to World Bank statistics, developed and developing countries have high ratios, whereas least developed countries have low ratios.

Therefore, this paper aims to investigate the impact of Financial Development, Petroleum Prices on Trade Openness, specifically identifying this relationship in the ASEAN+ area from 2010 through 2022. From this standpoint, the paper has valuable recommendations for countries in the Trade Openness process, specifically Vietnam. The literature review is the next section, and a brief discussion of the methodology is provided in Section 3. Section 4 discusses the empirical results, and Section 5 presents the conclusion and recommendations.

2. LITERATURE REVIEW

2.1. Financial Development and Trade Openness

Previous empirical evidence signifies the undeniable connections of trade openness and financial development levels with economic performance across nations (Beck, 2002; Sachs *et al.*, 1995). Some papers indicate a positive relationship between financial growth and trade openness, while others show the opposite. However, the relationship is not direct and depends on various factors.

Many studies show that financial development affects trade openness. International commerce positively affects financial development (Kim et al., 2010). Beck (2002) found that better financial systems lead to higher trade balances and export proportions using manufactured goods data and the GMM approach. Wolde-Rufael (2009) uses VAR to show that financial development boosts imports and exports in Kenya. Svaleryd and Vlachos (2002) found from 20 OECD nations' research that countries with relatively high

financial growth encourage export businesses predominantly depending on finance. Feeney and Hillman (2004) demonstrate how asset market incompleteness affects trade policy in a positive theory of trade liberalisation. Their idea is that financial development will diversify investment risk, reducing the need for protectionist lobbying by specific interest groups and promoting freer trade. This paradigm links financial development to trade liberalisation.

Another group of research discovered the short-term adverse effects of financial development on trade openness, including the study of Kim et al. (2010), Daniel and Jones (2007), Minshkin (2007), and Stiglitz (2000). The authors argue that financial liberalisation tends to reduce monopolies in the banking sector, leading to lending booms and investment shifting to worse projects, eventually increasing financial fragility and financial crisis. Hence, financial development can generate more risks in the short run and adversely affect international trade in the shorter term. However, in the longer term, the studies mentioned earlier all find a positive influence of financial development on trade openness.

There are also many discussions about the impact of trade openness on financial development. Rajan and Zingales (2003) indicate that one way that trade openness can enhance financial development is through facilitating both foreign direct and portfolio investments. Do and Levchenko (2008) discovered that trade openness influences demand for external financing sources. Specifically, increased trade openness might trigger interest in innovative financial products, resulting in a higher supply of sophisticated financial instruments. Consequently, financial institutions would have more opportunities to expand to offer sufficient insurance and risk diversification in such environments.

Similarly, according to Rajan and Zingales (2001), trade liberalisation might spur the growth of finances in the country that aid agents in spreading the additional risks. This study empirically investigates the causal association between the two factors and concludes positive and economically significant relationships between them. Rajan and Zingales (2001) explain that trade openness may lead to increased risks as domestic economies have greater exposure to external shocks and global competition, which in turn spur the demand for financial instruments to diversify risk and assist businesses to withstand transient cash flow issues or unfavourable shocks.

2.2. Petroleum Price and Trade Openness

It can be said that the impact of gasoline prices on trade openness based on studies needs to be clarified when this also depends on the type of country, whether import oil or export oil country (Babuga & Naseem, 2022). However, increasing oil prices can indirectly negatively impact countries' trade openness.

Oil price changes are anticipated to impact the economy's trade performance and the value of its currency. For nations that export oil, changes in oil prices cause exchange rates to increase. In contrast, for nations that import oil, fluctuations in oil prices are anticipated to cause currency values to decline (Beckmann et al., 2020). Svensson (1982) investigates an oil-importing country with a small open economy and concludes that a temporary spike in oil prices would help increase savings and decrease investment, which benefits the current trade balance. Taghizadeh-Hesary *et al.* (2019) investigated whether swings in oil prices account for a sizable portion of the variability of trade balances and their non-oil and oil components. Åkerström and Ljungqvist (2016) evaluated the impact of oil price shocks on the overall trade and non-oil trade balances of ten oil-importing eurozone countries using a VAR model from Q1 1980 to Q4 2014. The results showed that the non-oil trade balances of the euro area nations reacted to oil price shocks similarly. Allegret, Mignon and Sallenave (2015) attempted to evaluate the association between oil price shocks and global imbalances using a model including trade and financial interdependencies from 1980 to 2011. The study indicates that the impact mechanism of oil price shocks on global imbalances depends on whether the shocks are from the supply or demand sides, and the primary adjustment mechanism for oil price shocks is the commerce channel. Following the veins, Hassan (2017) found that the volatility of the

oil price hurts Pakistan’s export earnings because an increase in the price of oil leads to increases in the prices of each item in the commodity basket and inflation, which causes the aggregate demand to decline and lowers output level. Rising import costs result from rising oil prices, adversely affecting Pakistan’s current account balances and output levels.

3. DATA AND METHOD

This research analyses the data of ASEAN+ (Vietnam, Japan, China, Korea, India, Pakistan, Brunei, Cambodia, Laos, Indonesia, Malaysia, Myanmar, Philippines, Singapore, and Thailand). There are many similarities between these nations, including their recent impressive rates of Financial Development (FD), Petroleum Price (PP), and Trade Openness (TO). The research data were gathered from the World Bank between 2010 and 2022. Given the length of the period, we expect to thoroughly examine the connection between FD, PP, and TO.

3.1. Model specification

In examining the impact of FD and PP on TP, we estimate our baseline empirical model as follows:

$$\ln\text{TOP} = \mathbf{b0} + \mathbf{b1}\ln\text{DCPS} + \mathbf{b2}\ln\text{CPI} + \mathbf{b3}\ln\text{PP} + \mathbf{b4}\ln\text{GDPPC} + \mathbf{b5}\ln\text{REER} + \mathbf{b6}\ln\text{GEE} + \boldsymbol{\mu1} \quad (1)$$

We adopt this model from the research of Honey (2021). Honey (2021) used three models with various variables to investigate factors impacting trade openness and concluded that financial development, petroleum prices, human capital, real effective exchange rate, and economic growth inevitably influence trade openness. Table 1 presents a detailed variable description.

Table 1: Variable description

Variables	Description	Measurements
lnTOP	Trade Openness	Ln (Import + Exports)/GDP
lnDCPS	Financial Development	Ln (Domestic Credit to the Private Sector)
lnCPI	Financial Development	Ln (Consumer Price Index)
lnPP	Petroleum Price	Ln (Petroleum price)
lnGDPPC	Economic Growth	Ln (GDP Per Capita)
lnREER	Exchange Rate	Ln (Real Effective Exchange Rate)
lnGEE	Human Capital	Ln (Government Expenditure on Education)

Firstly, lnTOP, the dependent variable, is the log result of the sum of imports and exports divided by GDP and it is a proxy for Trade Openness (TO) (Honey, 2021).

Financial Development (FD), an independent variable, is proxied by two variables: Domestic Credit to the Private Sector (*b1lnDCPS*) and Consumer Price Index (*b2lnCPI*). DCPS measure is employed vastly in literature to proxy for FD. According to Honey’s research (2021), DCPS represents the government’s allocation of money for research in Pakistan to encourage investment and stimulate business activity. In prior research, Beck (2002) employed DCPS as a proxy variable for financial progress. Besides, an additional indication of domestic macroeconomic health that can have a significant bearing on financial development is the Consumer Price Index (CPI) (Naceur et al., 2014). Reduced credit demand, insolvency, and investment restraints stem from a higher index and stunt the economy’s progress (Boyd et al., 2001). If inflation impacts the growth of the financial system, it will have substantial consequences in the long run (Ibrahim et al., 2022). At the same time, the CPI is used to gauge inflation’s pace.

b3lnPP is a variable proxied for Petroleum Price (PP), which has long been seen as a sign of economic stability, mainly because of how heavily dependent the world is on oil goods. Furthermore, because oil is the most widely traded good on the worldwide market in terms of both volume and value, the price of oil significantly impacts the current global economy (Olajedo, 2020). Additionally, the price of products and

services that use much energy is correlated with the price of energy, which is dominated by the price of oil or gasoline. Finally, the price of other fuels is partially tied to gasoline (even though oil cannot entirely substitute for electricity, coal, and natural gas, especially in the Industry of Transport). For these reasons, sudden fluctuations in gasoline prices have far-reaching consequences for both oil importers and exporters. Hence, this study uses the price of petrol as a stand-in for the cost of petroleum in 15 nations.

Based on prior research and Yanikkaya's (2003) empirical investigation, we employ GDP per capita ($b4\ln\text{GDPPC}$) as a proxy for economic growth in the role of a control variable. EG is a variable being reviewed by many previous research. In detail, it was defined as the process of increasing the sizes of national economies, the macro-economic indications, especially the GDP per capita, in an ascendant but not necessarily linear direction, with positive effects on the economic-social sector (Haller, 2012).

The Real Effective Exchange Rate Changes are a control variable in this investigation ($b5\ln\text{REER}$). This shows "the change in the value of the domestic currency compared to the weighted average of other traders from the same country" (Hassan et al., 2017, p.18).

As more government spending on education is associated with higher literacy rates, which increases the economy's human capital, it is also used as a control variable in estimating gross domestic product (GDP) growth. Specifically, this variable is employed for nations in the ASEAN+ group, where government spending on education is a priority (Deger, 1985).

3.2. Estimation method

In this study, we use the Generalized-method-of-moments (GMM) estimators for dynamic panel data to determine how these data work. We use the recent generalised method of moments (GMM) dynamic panel data techniques to find and test for these possible regions. These techniques can deal with the fact that FD, PP, and TO may all happen simultaneously, allowing us to focus on the effect of the exogenous component of FD and PP on TO. As discussed thoroughly in the literature review, there is a high probability that the model will have simultaneity bias as 2-way causal relationships between the main independent and dependent variables were found. Additionally, using panel data also lets us control for effects that are unique to each country and include information from each country over time. The model is also estimated by GLS (Generalized Least Squares), FEM (Fixed Effects Model), and REM (Random Effects Model), which are all sub-methods. These are used to test the consensus on the direction of the impact of FD and PP on TO.

GLS weights observations to address variance differences (Tasker & Stedinger, 1989), it calculates these weights using the independent variable covariance matrix and error covariance matrix. FEM preserves unit fixed effects (Cooper & Hedges, 1993). but it cannot model insignificant fixed effects since it requires units to differ. According to Hedges (1983), REM solves unit random effects by considering them as random variables and not matching units. REM believes these random effects are regularly distributed and affect unit attributes. GMM (Generalized Method of Moments) calculates regression model parameters without data distribution assumptions or mismatched models (Stock & Wright, 2000). GMM criteria ensure that the parameters are best estimated from the independent variables.

The GMM estimators are well-designed to fix the problems with earlier estimation methods, such as the fact that they were used simultaneously and left out bias. The system-GMM (SGMM) estimator was made by Arellano and Bover (1995) and Blundell and Bond (1998). It helps improve efficiency because it gives more accurate and less biased predictions. Since the two-step SGMM provides reliable predictions and is less affected by heteroscedasticity and autocorrelation than the one-step estimator, it was chosen for this research. The endogeneity problem is also taken into account by the SGMM estimate. Since the validity of the instruments is so crucial to the consistency of the SGMM estimator, the study uses the Sargan test of overidentifying limits to see if the instruments are valid or not. This test assumes that if the null hypothesis about the validity of the instruments is not rejected, the instruments are valid.

In the same way, the Arellano-Bond autocorrelation test is used to check for serial correlations of a higher order than the first in the first-differenced errors. This is because it is presumed there will be no autocorrelation of the disturbance terms at the second level. If it is not shown that the disturbance term is correlated, then the SGMM estimator is consistent.

First, we define v_t as a set of random variables, and then we define $f(.)$ as a set of functions, where θ_0 is the genuine unknown vector parameter that needs to be estimated. Then, we have the following form of a population moment condition:

$$E\{f(v_t, \theta_0)\} = 0, \quad t \in T \quad (2)$$

Oftentimes, $f(.)$ will only contain linear functions, at which point the problem reduces to a straightforward case of linear regression. Non-linear regression arises when $f(.)$ is a product of errors and a function of the observed variables.

4. EMPIRICAL RESULTS ANALYSIS

4.1. Data description

Table 2: Descriptive statistics

Variables	Obs.	Mean	Median	Std. Dev	Kurtosis	Min	Max
DP (Domestic credit to the Private sector)	165	82.2787	79.9	51.1133	-1.3164	5.1	193.5
CPI (Consumer Price Index)	190	124.0628	115.15	24.5525	1.7559	98.4	219.1
PP (Pump Price for petroleum) (US\$ per litre)	189	1.0493	1.03	0.3794	0.4847	0.32	2.18
EG (Economic Growth) – GDP per capita (current US\$)	192	13498.9821	3681.1	17709.0053	1.0809	40.458	72794
ER (Real effective exchange Rate)	182	111.4491	107.245	18.7671	0.1224	60.8	163.05
HC (Human Capital) –Government expenditure on education	166	281.7742	10.835	3486.3839	165.9986	1.7	44930
TO (Trade Openness) – (Imports + Exports)/GDP	184	1.0672	0.6275	2.3721	144.0483	0.07	31.2

Descriptive statistics are shown in Table 2, indicating that most variables have mean values greater than their standard deviation, including DP, CPI, PP, and ER. The standard deviation of EG (Economic growth) is significantly larger than the rest of the variables because it is expressed as GDP per capita (current US\$) spanning from least developed countries, developing countries, and developed countries in Asia. Table 2 indicates that the kurtosis of most variables, including DP, CPI, PP, EG, and ER is lower than 3. Therefore, they have a platykurtic distribution with thin tails (fewer outliers). From Table 2, a right-skewed distribution was detected as the mean values are higher than the median values for all variables.

Table 3: Correlation Matrix

	DP	CPI	PP	EG	ER	HC	TO
DP	1						
CPI	-0.2118	1					
PP	0.4208	-0.1872	1				
EG	0.4105	-0.4136	0.4155	1			
ER	-0.0075	0.3388	0.0188	-0.0912	1		
HC	0.4696	-0.4080	0.0275	-0.0315	0.0364	1	
TO	0.2290	-0.5410	-0.1161	0.3964	0.0024	-0.0433	1

The correlation matrix was calculated to determine whether the variables had substantial impacts on the dependent variable named TO (Trade openness) and to detect the possible multicollinearity issue of the model. The EG and DP (used as a proxy of FD) have a statistically significant beneficial impact on the

TO, whereas the ER has a marginally significant positive impact. Additionally, the PP and CPI (used as a proxy for the FD variable) adversely affect TO variable, while the HC has a weakly negative effect on TO. Therefore, this statistic's significant associations are within a tolerable range, enabling an investigation of the interaction between independent and dependent factors. Additionally, the model is logical regression because there is no multi-correlation problem among the explanatory variables, allowing the remaining diagnostic tests to be run.

4.2. Empirical result

This study examined the relationship between Financial development, Economic growth, Petroleum price, Real effective exchange rate, and Human capital on Trade Openness in the context of ASEAN+ countries from 2010-2022. The study employed the GMM method to estimate the relationship between variables. The result indicates the relationship between the variables in ASEAN+ countries.

Table 4: Model results

Variables	GLS	FEM	REM	GMM
	Trade Openness	Trade Openness	Trade Openness	Trade Openness
DP (Domestic credit to the Private sector)	0.192** (2.11)	0.142* (1.97)	0.163** (2.31)	0.312** (2.29)
CPI (Consumer Price Index)	-0.308 (-0.78)	-0.281* (-1.92)	-0.315** (2.12)	-0.635* (-2.31)
PP (Petroleum Price)	0.115 (0.78)	-0.244*** (-3.61)	-0.235*** (-3.42)	-0.169** (-2.37)
EG (Economic Growth)	0.0999** (2.17)	0.00373 (0.16)	0.00852 (0.36)	0.0121 (1.58)
REER (Real effective exchange Rate)	0.0580 (0.15)	-0.507** (-2.45)	-0.468** (-2.24)	-1.055* (-2.36)
HC (Human Capital)	0.351** (7.14)	0.00887 (0.52)	0.0139 (0.79)	-0.00569* (-2.47)
TO (Trade Openness)				0.456 (0.74)
_cons	-1.618 (-0.71)	2.717** (2.56)	2.554** (2.36)	
N	137	137	137	107
R-sq		0.264

4.2.1. The Impact of Financial Development on Trade Openness

The results presented in Table 4, based on the GMM model, show that financial development significantly impacts trade openness when using domestic lending to the private sector as a proxy for that development. The findings imply that trade openness might rise to 0.312% with a 5% increase in domestic lending to the private sector. This suggests that a rise in financial growth, such as an increase in domestic credit to the private sector, may promote trade openness. This may be because when countries have high levels of domestic credit to the private sector, it indicates stability in the financial field by reducing reliance

on foreign capital and the risk of external shock (Asongu & Odhiambo, 2020). The increase in domestic credit to the private sector helps to reduce effectively the crowding-out effect of trade openness, according to the study by Nguyen et al. (2018).

This finding is in the vein with the study of Beck (2002), which suggests that private credit significantly influences trade openness, including the share of trade balance, manufactured exports, and total merchandise exports of manufactured goods in GDP. Private credit has a more significant impact on exports than imports, even though it also enters considerably positively in regressions of manufactured imports as a percentage of GDP.

However, according to Table 4, financial development negatively impacts trade openness when considering the consumer price index as the proxy variable. This is because the consumer price index increase indicates inflation which can cause a decrease in the export when foreigners are no longer interested in the export product due to its high price (Beck, 2002). On the other hand, a deflation phenomenon leads to a decrease in the prices of goods and services, resulting in an increase in a country's currency increases relative to other currencies (Sonnenshein, 2022). Eventually, exports would become more expensive, and their demand could be reduced.

4.2.2. Petroleum Price Has an inverse impact on Trade Openness

Regarding the price of petroleum on trade openness, Table 4 demonstrates that the price of gasoline, used as a stand-in for the PP variable, has an enormously positive impact on the trade openness variable. In the case of ASEAN+ nations, which mainly import petroleum from nations outside of OPEC. Therefore, a drop in the price of gasoline may increase the trade openness of these nations when it presents a chance to lower the shipping costs associated with export and import processes. This result is consistent with earlier research, which stressed that the type of country—whether it imports or exports petroleum—has a beneficial impact on trade openness (Bala et., 2019; Delatte & López-Villavicencio, 2012).

On the other hand, due to the characteristics of nations that import petroleum, an increase in the price of gasoline may decrease trade opportunities. Oil import countries experience an oil shortage during the trade process due to rising oil prices. The trading openness will therefore be restricted in terms of import and export. Additionally, countries' demand and supply curves are also heavily impacted.

4.2.3. Economic Growth Enhances Trade Openness

The results from Table 4 confirm previous empirical results on economic growth and trade openness. Since economic conditions improve, so do living standards, and people are increasingly choosing high-quality products from other countries. From this angle, it motivates people to spend more on imported goods and support the economy. Investment opportunities can increase output and enable the export of excess goods. The study by Honey (2021), which also highlighted the beneficial influence of economic growth on trade openness, supports this conclusion. On the other hand, it is noteworthy that the level of trade openness has also decreased due to the slowdown in economic growth.

4.2.4. Real Effective Exchange Rate Adversely Impacts Trade Openness

According to the data in Table 4, the Real effective exchange rate and Trade openness have a negative relationship. Specifically, an increase in the Real effective exchange rate of countries indicates that its exports are becoming more expensive and that country's imports are becoming cheaper. This tendency may cause a decrease in the export rate and import demand when the cost to conduct the trading process is expensive for a developing country (Balázs & Amina, 2003).

4.2.5. Human Capital Has a negative impact on Trade Openness

According to the result of the GMM estimation, trade openness is negatively affected by the human capital variable measured by the government expenditure on education as a percentage of GDP. This finding

contrasts with the study of Benarroch and Pandey (2012), which states that higher human capital leads to better levels of trade openness. However, this finding is consistent with the context of emerging economies examined in this paper. As explained by Meschi et al. (2008), one driver of trade openness is the demand for cheaper unskilled labour, as in the case of ASEAN+ countries compared to developed ones.

5. CONCLUSION

This article has examined the relationship between Financial development, Petroleum price, and Trade openness in the context of ASEAN+ countries. Besides, Real effective exchange rate, Economic growth, and Human capital were contributed as the control variable. To reach the goal of this paper, the GMM panel data model was used to examine the link between variables in a panel of ASEAN+ countries over 13 years from 2010 to 2022, where petroleum price, financial development, and economic growth have a significant and positive impact on trade openness, while the Human Capital and Real Effective Exchange Rate have negative impacts on this dependent variable.

5.1. Recommendations

5.1.1. Recommendations for ASEAN+ countries

Although the main findings of this study are similar to those of other studies in the literature, it is noteworthy to consider some recommendations based on this result for the policy of some countries in ASEAN+ for the further period after the Covid pandemic and the inflation problem.

Firstly, regarding financial development, it is necessary to ensure and create the stability of the domestic credit to the private sector by quality institutions when the country aims to increase the level of trade openness. This is considered a challenging task facing governments in ASEAN+ countries: modernising their financial sectors, particularly their banking systems and other financial institutions, to encourage the growth of the private sector. In addition, governments should control the inflation rate considerably to ensure the Consumer Price Index, thereby facilitating the export and import process.

Secondly, according to the relationship results of Petroleum Price and Trade Openness, it can be seen that the reduction in petroleum prices has a positive impact on the major gasoline-importing countries in ASEAN+. Therefore, if an increase in oil prices could create challenging effects for these countries, the policymakers should consider the different policy and trade openness degree to react immediately before the petroleum price fluctuation. Moreover, the diplomatic relationship with OPEC countries is essential in increasing petroleum prices.

Thirdly, as regards Real Effective Exchange Rate, when one country's inflation rises relative to another country's (i.e. there is an inflation differential), the purchasing power of the domestic currency decreases relative to the foreign currency, the value of the domestic currency decreases (Other things being held constant), hence, the exchange rate of the foreign currency against the domestic currency increases (or the exchange rate of the domestic currency against the foreign currency decreases) and vice versa. The State Bank's currency rate adjustment in the current context is appropriate, avoiding the drawbacks of previous exchange rate operations. However, the adverse effects of the exchange rate adjustment are not slight. As a result, in addition to introducing a new exchange rate strategy, the government must simultaneously implement other measures to restore macroeconomic stability and take economic action to reduce any adverse consequences of the government. This strategy is equivalent to raising prices by taking advantage of an increase in the currency rate, which is unfavourable for the economy.

5.1.2. Recommendation for Vietnam

According to the data collected from Worldbank, the Financial development specifically is the domestic credit to private sectors ratios of Vietnam during 2010-2022 are generally higher than the average ASEAN+

countries and tend to increase in the last period. According to the result, this tendency creates opportunities for increased trade openness in the Vietnam context. In detail, to enhance the domestic credit to the private sector, policymakers can reduce the interest rate to stimulate borrowing and investment in the private sector, especially during the financial crisis during these years. Hence, it also increases the market liquidity of Vietnam. From this standpoint, it strengthens a domestic country's financial sector, preventing the crowding effect in the trade openness process. However, this solution can cause inflation in the short term and consequently lower the country's GDP growth (Muhammad, 2022), which policymakers should consider.

In terms of the consumer price index, the result shows that the decrease in CPI can stimulate trade openness. In Vietnam, the CPI has a rising tendency due to increased crude materials and production costs. To reduce the CPI, the Vietnamese government can reduce the import tariff because it contributes to the cost of goods and services, leading to higher inflation (Hong et al., 2022). Hence, this solution not only reduces the CPI but also stimulates the import value of Vietnam.

Regarding the petroleum price solution for oil-importing countries such as Vietnam in the oil price increasing context, the government can use the diplomatic channel to negotiate with OPEC countries, which helps Vietnam secure access to oil reserves. On the other hand, policies that lessen the reliance on oil imports in response to rising oil prices can be considered, such as finding renewable energy sources to ensure the trading process is completed on time.

5.2. Limitations

This research paper still needs to be revised when it only analyses the impact of financial development and petroleum price factors on trade openness in the environment of ASEAN countries and some other countries located in Asia. In addition, there needs to be more data when it is thoroughly searched, which may cause shortcomings in the research process. On the other hand, the proxy variable of financial development has yet to be thoroughly mentioned in this study, in which there is a lack of assessment of the banking system of each country. Finally, the data we collect in this study has shortcomings because financial information in ASEAN+ countries is public until the end of 2022. Therefore, these limitations could be overcome in our further research.

ACKNOWLEDGEMENT

While finalising this research paper, we are grateful to the individuals who commented and provided suggestions to improve the quality of the paper. In addition, thanks are due to the authors of the literature we consulted to develop and consolidate our results.

REMITTANCES AND ITS IMPACT ON ASEAN ECONOMIC GROWTH

**Author: Nguyen Ngoc Quynh Anh¹, Ho Phan Khanh Linh¹,

Mentor: Ngo Thi Hang¹**

ABSTRACT: Remittances play an important role in the economy, especially in developing countries, as the remittances help to increase the national savings and ease the dependence on foreign exchange reserves and balance of payments, while simultaneously contributing to poverty reduction in receiving nations and communities, increasing investment in health, education and business. However, remittances can also increase the severity of the brain drain as well as erode the labor incentive of the remittance-receiving families. In this regard, this paper focuses on clarifying the impact of remittances on economic growth in ASEAN countries in the period 2000-2020. Using the fixed effects and random effects models, the research results indicate that remittances in ASEAN countries, with a relatively limited scale, may not be large enough to significantly drive the economic growth of ASEAN countries, which calls for feasible solutions to boost the scale of remittances, enabling ASEAN economies to benefit from remittances.

Keywords: remittances; economic growth; ASEAN; panel data.

1. INTRODUCTION

In essence, a savings account is a part of an employee's personal income that they have not yet put into consumption, and is a special form of accumulating money instead of storing gold, goods and services. Therefore, these countries need to consider the following measures to use remittances more effectively and remittance can be an important source of capital for the economy: International migration has become an issue of concern for the world community, especially for countries with high numbers of immigrants and migrants. Remittances sent home by migrants from developing countries remained stable and tended to increase markedly from 1990 to 2021, reaching \$554.9 billion in 2021 compared to \$27.0 billion in 1990 (Table 1). Remittances are more than double official aid and nearly two-thirds of foreign direct investment flows to developing countries.

Every year, migrant workers send significant amounts of remittances home, which is an important source of economic development. Remittances are highly valued in the economy, helping to increase national savings, reduce foreign exchange-related constraints and balance of payments, and also contribute to the development budget. Migration and remittances reduce poverty in communities of origin and lead to increased investment in health, education and business.

However, this type of outbound migration can also harm development as the host country loses highly educated and skilled workers, which is known as brain drain. Thus, lost in human capital can negatively affect economic growth as reflected in neoclassical growth theory. In addition, remittances can hinder economic growth by increasing the exchange rate, thereby making domestic goods less competitive in international market. In addition, the amount of remittances can also adversely affect the labor supply decision of families receiving remittances. Increasing remittances can be seen as increasing non-labor income, this procedure makes the recipient's families dependent on remittances and keeps them away from productive activities. Most of the time, this money is used for consumption rather than investment in production.

The two-sided impact of remittances on economic growth has become an issue, requiring objective studies to provide solid foundations and policy orientations to enhance the positive impact of remittances, while at the same time reducing the potential risks of economic stagnation and the degree of dependence on remittances of the receiving economy.

On that basis, this article provides a quantitative, objective, and comprehensive view of the impact of remittances on GDP growth in ASEAN countries. The paper seeks to assess the possibility of remittances becoming an effective tool to combat poverty, and even if remittances are not conducive to GDP growth, these cash flows could raise household incomes above the poverty line, allowing for more investment in human capital and possibly loosening credit restrictions. This is extremely important for the countries of Southeast Asia - a territory that is even less economically developed than other regions and continents.

2. LITERATURE REVIEW

Scientists and economists in many countries around the world have conducted many studies to assess the impact of remittances on economic growth, both in developed and developing countries. However, these studies have not reached consensus on the effect of remittances on economic development.

Among studies of developing countries, the Central European region, Meyer et al, (2020) with the use of panel data and a fixed impact model, studied the relationship between remittances and economic growth of Albania, Bulgaria, Macedonia, Moldova, Romania and Bosnia Herzegovina between 1999-2013 and showed that remittances have a positive effect on economic stability and growth. The study suggests that the influx of remittances causes households to increase their spending and spend part of their capital on investment, which in turn increases demand for products and domestic investment.

Also studying this area and using the same research method as Mayer et al., Kajtazi et al, (2022) continue to affirm that remittances have a positive impact on economic growth when studying the cases of 10 regional developing countries in the Central European region in the period from 2009-2019. In particular, the research paper emphasizes that the contribution of remittances to macroeconomic development in these developing countries is stable and important through investment and consumption. In addition, the results of Comes et al, (2018) also show the similarity of 7 Central and Western European countries in the EU: Romania, Bulgaria, Croatia, Czech Republic, Hungary, Slovakia, Slovenia in the years from 2010-2016,

Remittances not only affect through increasing consumer demand, thereby indirectly increasing GDP, but also have a positive impact on the health and education sectors when remittances flow directly into these areas, contributing to improving people's quality of life.

In assessing the impact of remittances on economic growth in the world's leading remittance-earning countries, Rao and Hassan (2011) demonstrated the positive effect of remittances on the economies of the 40 countries with the largest remittances globally using the Solow growth model. The Solow-Swan growth model, or exogenous growth model, is an economic model of long-term economic growth that is explained by three basic sources for calculating GDP: capital, labor, and productivity. Through this model, the authors have shown that through different capital channels, remittances are indirectly positive to the financial sector, which has the greatest influence on market volatility. A simple simulation that doubles remittances from 5 percentage points to 10 percentage points shows that the growth rate can be permanently increased by about 0,3 percentage points.

Sutradhar (2020) continues to confirm this view when studying 4 countries: Bangladesh, India, Pakistan and Sri Lanka between 1977-2016, Islam (2021) points out the positive relationship between remittances and economic development when studying the cases of the three countries of India, Pakistan and Bangladesh in the period 1986-2019 by using the general smallest average method (gls) and long-term impact estimation (FMOLS). The results of both of these methods show that remittances have a positive impact on long-term economic growth.

In another study by Sarkar et al, (2018) on the developing economy - Bangladesh - also showed the positive impact of remittances on the Bangladeshi economy in the period 1995-2016. The results of the study show that remittances from overseas workers have a positive impact on the country's economy through boosting consumption in domestic households as well as gross domestic investment and total capital accumulation, thereby indirectly increasing GDP growth.
